A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK

THE speech which was delivered by Lord CURZON in Delhi at the opening of an exhibition of Indian workmanship on Tuesday may be considered as an appeal for forgiveness for the offences against Indian art which were committed by Government officials. When it is remembered that South Kensington sent out a number of teachers, who had just gone through the curriculum of that institution in order to reveal the mysteries of form and colour to Indian artists and craftsmen, a system which was fatal to all, some sort of atonement is called for. It should be remembered also that many of the native crafts were degraded by having them practised in prisons by the criminals. The destruction of Indian buildings by English officers was additional evidence of our indifference to native art. Lord CURZON has declared that since he went to India he has lamented the deterioration of the arts and handicrafts. One of the causes he maintains is the ascendancy of commercialism and the employment of machinery. Indian art, according to his lordship, can never flourish if the chiefs and aristocracy decline to patronise it. So long as they prefer to fill their palaces with flaming Brussels carpets, Tottenham Court Road furniture, cheap Italian mosaics, French oleographs, Austrian lustres, German tissues and cheap brocades, his Lordship feared there is not much hope. Unfortunately, the Indian chiefs and aristocracy could reply they were only imitating English practice, and were endeavouring to make their homes correspond with those in England. The outcome of a long course of South Kensington teaching is represented in that way. For the beautification of an Indian house or the furniture of an Indian home his Lordship considered there is no need to rush to European shops in Calcutta or Bombay, but in almost every Indian State or province, in most Indian towns and many Indian villages, there still survives art, there still exist artificers who can satisfy the artistic as well as the utilitarian tastes of their countrymen, and who are competent to keep alive this precious inheritance which we have derived from the past. If after so many years meddling with native art there is a survival of that kind, what must have been the state of India forty years ago, when the South Kensington missionaries attempted the conversion of artists and workmen to the Departmental creed? Lord CURZON's efforts are praiseworthy, but he must have the conviction that his efforts are too late.

WHY should public bodies be so often doubtful about the overtures of architects? That is one of the questions to which no satisfactory answer can be given, unless in the Shakespearean manner, "We could, an if we would—If we list to speak—there be an, if there might." On Tuesday an example of doubt without a base was afforded by the Steyning Guardians. They propose to erect hereafter infirmary buildings. Messrs. CLAYTON & BLACK, who have carried out much work, were asked to prepare a scheme. In reply it was stated by the architects that they assumed preparatory plans rather than complete working drawings were contemplated, but a complete workhouse infirmary with all modern requirements would have to be considered. Messrs. CLAYTON & BLACK also mentioned that the plans would be regarded as the necessary preliminary sketch

plans of the ultimate buildings, which they quite understood might be deferred for some considerable time, and any payment would consequently merge in the usual commission when the work at some future date should be carried out. The reply was fair in all its parts. Why should any architects be asked to prepare plans for an important work and be satisfied with having them treated as mere sketches? A discussion arose from which it was evident that the Guardians desired to possess and pay for the preparatory plans without incurring any liability to the architects. A resolution was proposed that the clerk be instructed to obtain the fees payable to the architects for submitting a scheme for the future buildings in connection with the workhouse, and that thereby the Board be not bound to any special scheme or firm. With all respect to the Guardians, we must say the proposal arises from a complete misunderstanding of an architect's rights. It is possible to obtain by competition a number of plans, and the Guardians can study them all without incurring the least responsibility to the authors. But when architects are requested to investigate the requirements of a particular case their plans are different from those which would be submitted in competition, and should be valued accordingly. Eventually it was decided to defer the consideration of the subject for a fortnight.

IN 1885 Professor NISSEN, of Bonn, concluded a series of investigations about the orientation of Christian churches, and especially those dedicated to martyrs in the early period of Christianity. He was satisfied that on the anniversary of the saint to whom the building was dedicated, either at sunrise or sunset, the beams were cast along the axis. Before Professor NISSEN's inquiries it was supposed the churches were only oriented in a general way, just as it is said a district lies north, south, east or west of another, without much regard to the actual bearing. More recently a connected subject has been discussed in Göttingen by Dr. CHARLIER. If we assume orientation to be arranged as exactly as Professor NISSEN maintains, is it possible from the angle formed by the axis with a fixed north line to arrive at the date of the building? At first sight that may seem as absurd as the old yarn about discovering the name of the captain of a ship when the length, breadth, height of main mast, tonnage, &c., are the data. But as it is possible for astronomers to calculate the positions of the heavenly bodies at certain times in past years, the question has at least some grounds to rest on. An experiment has been tried with the cathedral of Lund, in Sweden, which has been very little changed since the time of its erection in the twelfth century. It is dedicated to St. LAURENCE, the martyr, whose feast falls on August 10. It was found that the axis of the church was $24^{\circ} 3'$ north of the west point, and would thus run in a W.N.W.—E.S.E. direction. The altar would appear from that reckoning to have been set up 768 years before the time of calculation a couple of years ago, which would make the date of the foundation A.D. 1132. The ceremony, according to the record, was performed in A.D. 1143. Calculations were made with several other churches with results no less approximate. The correspondence in this respect between Christian churches and Egyptian temples is remarkable.

"EUROPE"—"AMERICA." BY SIR EDWARD J. POYNTER, P.R.A.

WORCESTER CATHEDRAL.

IN one of the little diaries which Dr. JOHNSON used to keep whenever he departed from his cherished London, we have an entry relating to a visit to the cathedral of Worcester. It is as follows:—"Thursday, Sept. 15, 1774.—We went to Worcester; a very splendid city. The cathedral is very noble, with many remarkable monuments. The library is in the chapter-house. On the table lay the *Nuremberg Chronicle*. I think of the first edition. The cathedral has a cloister. The long aisle is, in my opinion, neither so wide nor so high as that of Lichfield." The remarks are suggestive. JOHNSON, with his weak vision, was not well adapted to criticise architectural details, but he was possessed of sensibility, and the impression of nobility which he received from the cathedral was an acknowledgment of the merits of the building. Apparently it revived no associations in him. The fact is Worcester Cathedral was not the scene of historical or legendary incidents with which a scholar like JOHNSON would be acquainted.

The diocese is no doubt ancient. There is a list of bishops, without any break, from A.D. 680: in the most troubled times the chair was never long without an occupant. Among them were such ecclesiastics as St. DUNSTAN, St. WOLSTAN, St. OSWALD, JULIUS DE MEDICI, HUGH LATIMER, JOHN WHITGIFT, but their renown was derived from their actions in other places. The early OTTORS, EATHOREDS, KINEWOLDS, THEULPHS, MAUGERS, &c., may all have been distinguished men who ruled the diocese justly, and set examples to clerics and laymen of the Christian life. But Worcester was too remote to receive much attention from the Historic Muse, and the references to the buildings are too uncertain to be accepted with confidence.

Bishop TANNER of St. Asaph, who wrote in the beginning of the eighteenth century, gives the following account of the origin of the see:—"Upon the division of the once great kingdom of Mercia, an episcopal see, with a chapter of secular clerks, was placed here by King ETHELRED and Archbishop THEODORE, about the year 680, in a church dedicated to St. PETER, which came in the next century to be generally called St. Mary's. Upon the pretended reformation of these ecclesiastical societies, by the expulsion of the seculars, in the time and by the command of King EDGAR, Bishop OSWALD, before A.D. 964, founded a new cathedral in the old churchyard to the honour of the Blessed VIRGIN, and placed therein a prior and monks. Soon after the Conquest this convent from the number of twelve increased to fifteen of the Benedictine order, by the zeal and munificence of good Bishop WOLSTAN, who built for them a new and large monastery, A.D. 1082." There is a legend about a stone for the building which eight men were unable to move owing to a demon having selected it as a seat. He was exorcised by OSWALD, and the difficulty was at once ended. The legend has been relied on as evidence that in the tenth century masonry was employed in the construction of churches in preference to timber.

A few of the entries relating to the early buildings may here be summarised. In 1084, according to WILLIAM OF MALMESBURY, a new church was commenced to take the place of one which had been destroyed during a Danish invasion. That building succumbed to fire in 1113. In 1160 there was a reconstruction; the tower fell in 1175, but for this no cause is assigned, "*Turris nova Wigorniae corruit*." Five years afterwards there was another fire. In 1201 there is a similar entry, "*ecclesia Wigornensis est combusta*." The canonisation of Bishop WOLSTAN in 1203 must have attracted many devotees to Worcester. Among them was King JOHN, and he gave 100 marks towards the restoration. A few years later there was a revolt against JOHN, and the crown of England was offered to LOUIS, eldest son of the king of France. He departed from Calais with an army in 680 ships and boats. In the war which ensued Worcester sided with the French Prince. The Earl of CHESTER was, however, able to overcome the opposition and the city was sacked. The monks were fined and were compelled to melt the shrine of the saint in order to raise the money. It is remarkable that when JOHN died within the succeeding twelve months his body was buried according to his injunctions in the cathedral, near the shrine of St. WOLSTAN.

In 1218 the new cathedral was dedicated, the patrons being the Blessed VIRGIN, St. PETER, St. OSWALD and St. WOLSTAN. In 1220 the bells were blessed. Two towers were cast down by a storm two years later. An entry of 1224 is suggestive of new works undertaken by Bishop WILLIAM DE BLOIS, and a change from Norman to the style of the period:—"Inceptum est novum opus frontis Wigorn. Ecclesie Episcopo Willelmo jaciente fundamentum." Professor WILLIS concludes that the work was carried out "without disabling the Norman presbytery and the high altar; so that the services of the church continued in their original place, until the completion of this first portion of the work made it necessary to pull down the Norman presbytery, and erect the hollow soffit work in its room, by which the Early English structure was connected with the tower." The successor of WILLIAM DE BLOIS was WALTER DE CANTELUPE, who was related to THOMAS DE CANTELUPE, the Bishop of Hereford, one of the great English ecclesiastics. There is no record of operations by WALTER at Worcester. GODFREY GIFFART, who acted as bishop from 1268 to 1301, introduced metalwork, which has given rise to some discussion. He presented not only marble columns, but rings of brass or copper. "*G. GIFFART exornavit columnas orient. partis ecclesie columnellis marmoreis cum juncturis aereis deauratis*." The purpose of the rings is not stated, and WILLIS arrived at the opinion that they were intended to conceal the clumsy joining of the shafts, or it may be to strengthen the columns where slight fractures had occurred. NICHOLAS of Ely, the predecessor of GIFFART, who had been translated to Winchester, bequeathed in 1280 60 marks towards the rebuilding of the tower, an indication of a renewed necessity for expenditure on that part of the building. Bishop COBHAM, who ruled the diocese between 1317 and 1327, is credited with the north aisle,

and Bishop WAKEFIELD, who died in 1394, with alterations at the west end of the building, including the window, the cloister, vaulting of choir and the stalls. It is not improbable that he may also have completed the tower.

It cannot be said that many changes were made in the building at the time of the Reformation. The history of that period is, however, as obscure as that of the earlier time. Prince ARTHUR TUDOR, who was married in his fifteenth year to KATHERINE of Spain, died at Ludlow Castle in 1502, and was buried with great pomp in the cathedral. A chantry chapel has been erected, and forms one of the most interesting features in the building. HENRY VIII. may have been kindly disposed towards the cathedral containing the remains of his elder brother. HUGH LATIMER, as chaplain to ANNE BOLEYN, was able to obtain the bishopric, but he resigned the office after four years. He is stated to have had the shrines of St. OSWALD and St. WOLSTAN destroyed; whether other parts of the building suffered cannot now be determined.

In 1642 the Parliamentary army held possession of Worcester, and much damage was inflicted on the cathedral. Four years subsequently there was a siege of the city; it was captured and over 6,000 prisoners were confined in the cathedral. After the Restoration the building was visited by JOHN EVELYN, who tells us how he found "the cathedral much ruined by the late wars, otherwise a noble structure." The impression on him corresponded with that on JOHNSON 120 years afterwards. In the early part of the eighteenth century many repairs were rendered necessary, and the work was continued from time to time. But it was not until 1857 that a systematic restoration was commenced by Mr. A. E. PERKINS, one of RICKMAN'S pupils, and it was completed under the direction of Sir GILBERT SCOTT in 1874.

It is a peculiarity of Worcester Cathedral that in its indications of inventive power are to be traced. It is pointed out by PARKER as a remarkable fact that in the crypt "no settled form of base seems to have been agreed upon, though the capitals are all alike. In this crypt of Worcester there are six different forms of bases." Mr. E. S. PRIOR explains the position which Worcester holds in the development of Gothic. In describing profiles of the pier arches, he says:—"At Worcester effect is obtained by a deep-cut cavetto and delicately contoured rollwork, with an accent of sharp arris and modelled surfacing—what was quickly elaborated in the mason's craft of the Cistercian Dore and Strata Florida, and had a still greater reduplication of bead and hollow in the cathedral naves of Wells and Dublin; as, too, in the parish church of St. Mary's, Shrewsbury, and the Cistercian nave of Cwm-hir." In another part Worcester is compared with Lincoln in the following manner:—

From Worcester west bays to Lincoln quire was a space of thirty-five years. In the former Gothic art is to be seen blocked out, in the latter finished and polished. Worcester had: first, complete subordination of wall structure to the vault, with a use therein of the Pointed arch; secondly, the emphasis of this subordination by a lightening and refinement of the structural detail. Its monoliths and the distinctions of coloured material foreshadow the uses of Purbeck; its triforium is a study for the double arcadings which played so large a part in the thirteenth-century style, and, finally, it has carvings and mould sections, rough, indeed, but still showing the path of Gothic sculpture. At Lincoln all are carried to extreme refinement, and the scheme is consistent throughout. The round abacus crowns every pillar, and every arch is now Pointed, in window, door-head and wall arcade, as in the constructional service of vault and arching.

It may also be recalled how FERGUSON explains the experiment at Worcester of a chapter-house consisting of a circular chamber with a central pillar. He adds, "and the design was so much approved of that it became the typical form of the English chapter-house ever afterwards."

Worcester Cathedral has not been fortunate enough to find an enthusiast who was competent to claim due recognition for it. The result has been that it is usually treated with more or less reserve, as if there were defects in it which did not allow of a comparison between it and other cathedrals. The illustrations which we are about to publish will, we hope, have the effect of modifying if not changing popular opinion on the subject. If considered

in its connection with the history of Gothic architecture, Worcester Cathedral becomes a most remarkable work, for in it we see the aspiring efforts which should always be regarded as the chief glory of the Gothic architects.

ARCHITECTURE IN 1902.

THE great events of the past year in the national history have not proved, as was fondly hoped by many members of the architectural profession, to be the portals immediately leading to that period of renewed activity which, sooner or later, will no doubt succeed to the depression under which we are still suffering.

PEACE

has been proclaimed and the Coronation, though delayed by the sudden and alarming illness of our SOVEREIGN, has come and gone. The results of the costly and, it must be confessed, extravagantly conducted war in South Africa have not yet passed away. The fruits of our dearly-bought victory have not yet matured. The millions that have been expended in the struggle have scarcely commenced to return by the resumption of commercial and industrial activity.

CAPITAL AND LABOUR

are not at the present time so proportioned that speculation in bricks and mortar is sufficiently tempting to justify the expectation of another boom in building for some time to come. Capital has been hard hit, labour has not up till now completely accommodated itself to the altered aspect of the national economic position. With Consols below 93 and brickwork at 17½ or 18½ per rod, it is hopeless to look for a renewal of the flourishing conditions that architecture enjoyed in the halcyon times "before the war." The high wages and diminished output that were labour's share of national prosperity, the increase of luxury, leisure and laziness that marked the whole national life when times were good must give way before our present circumstances can improve. Let us hope for the sake of us all that labour will accept the inevitable without involving the waste of the national power by internecine struggle in strikes, such as is now threatened in South Wales.

The most striking event of the past year in English architecture has been the selection of the architects chosen to compete for the

LIVERPOOL CATHEDRAL,

a selection that has, by the departure of the assessors from the spirit of the promoters' invitation, excluded many of the most capable church architects of the present day. The selected competitors were Messrs. AUSTIN & PALEY, Mr. C. A. NICHOLSON, Mr. G. GILBERT SCOTT, Mr. MALCOLM STARK and Mr. W. J. TAPPER; whilst honourable mention was accorded to Sir THOMAS DREW, Mr. J. OLDRID SCOTT, Mr. A. H. SKIPWORTH, Mr. H. C. CORLETTE, Mr. C. A. NICHOLSON, Mr. F. WALLEY, Mr. JAMES H. COOK, and Messrs. REILLY & PEACH. Whether the selected competitors can truly be termed fortunate the future alone can show us, but in the light of the experience of the past and of the present evidence of local hostility to the selected site and apathy to the subscription list, the outlook is dark for those who are devoting their energies to the production of their designs for the proposed cathedral.

Apart from that for the Liverpool Cathedral the past year has not been very remarkable for the competitions that have been decided. That for

NEW BATHS AND LIBRARY, LEEDS,

resulted in the premiation of Mr. H. AYSCOUGH CHAPMAN first, Mr. WILLIAM BAKEWELL second, Mr. PERCY ROBINSON third. For the

NEW OFFICES FOR HEARTS OF OAK BENEFIT SOCIETY, Messrs. ESSEX, NICOL & GOODMAN were first, Messrs. MEABY & WEBBE second, and Messrs. LANCHESTER, STEWART & RICKARDS third. In a competition limited to local architects for

CEMETERY BUILDINGS, WITHINGTON, MANCHESTER, the premiated designs were those of Mr. ERNEST WOODHOUSE first and second, Messrs. ALFRED H. MILLS & ROGER OLDHAM third. For the

QUEEN VICTORIA MEMORIAL, LIVERPOOL, the premiums were awarded to Mr. R. LINDSAY CLARKE first, Messrs. ALLEN, SIMPSON, WILLINK & THICKNESSE second, Mr. H. C. FAHR third, but the second premiated design was subsequently adopted. For

BATHS AT BRAMLEY, LEEDS, the successful competitors were Mr. J. LANE FOX first, Mr. WILLIAM BAKEWELL second, Messrs. DIXON & HILL third. For

NEW ART SCHOOL, HULL, Messrs. LANCHESTER, STEWART & RICKARDS were placed first, Messrs. SPENCER W. GRANT & JAMES BOWDEN second, Mr. FRANCIS J. SMITH third. For the

QUEEN VICTORIA MEMORIAL, NEWPORT, ISLE OF WIGHT, Mr. PERCY G. STONE was first, Mr. ISAAC JONES second, the Hon. ARCHIBALD MCGAREL HOGG third. The competition for

CHELSEA BATHS was the cause of much heart-burning and animadversion, due to the variance of opinion as to the precise order of merit entertained by the assessor, Mr. NORMAN SHAW, and the baths committee, who placed the design of Messrs. HARNOR & PINCHES first, that of Messrs. WILLS & ANDERSON second, and that of Mr. F. J. SMITH third.

This competition and the feeling it excited led to the formation of the

COMPETITION REFORM SOCIETY by a number of our younger architects who are most keenly interested in competitions, and who have been actively engaged by remonstrance with promoters, followed where considered necessary by abstention, in the endeavour to bring about more satisfactory terms in open competitions. The second competition for

SOUTH SHIELDS MUNICIPAL BUILDINGS resulted again in the victory of Mr. ERNEST E. FETCH, whose design was placed first by the assessor, Mr. BELCHER. The

ROYAL NORFOLK AND SUFFOLK YACHT CLUB-HOUSE, LOWESTOFT, was won in open competition by Messrs. G. & F. SKIPPER, with Mr. H. W. COLMAN second, and Messrs. BISSHOPP & CAUTLEY third. In a limited competition for

PUBLIC LIBRARY AT KINGSTON-ON-THAMES the design of Mr. ALFRED COX was placed first by the assessor, Mr. BASIL CHAMPNEYS. For the

WOLVERHAMPTON WOMEN'S HOSPITAL the first premium was awarded to Mr. A. EATON PAINTER, the second to Mr. G. H. STANGER, and the third to Mr. F. H. LYNES by the assessor, Mr. T. W. ALDWINCKLE. The competition for

BURSLEM ISOLATION HOSPITAL resulted in Messrs. SUTCLIFFE & SUTCLIFFE being placed first, Mr. E. C. H. MAIDMAN second, Mr. W. H. WALLEY third, and Mr. R. T. LANGDON fourth. For

INFIRMARY AT LEIGH, LANCASHIRE, Mr. J. C. PRESTWICH was placed first, Mr. HARRY W. PYE and Mr. ROGER F. BACON second, Mr. T. A. BUTTERY and Mr. S. B. BIRDS third. The competition for

HARROGATE TOWN HALL was won by Mr. H. T. HARE, with Messrs. WADDINGTON, SONS & DUNKERLEY second, and Messrs. HEAZELL & SON third. In the competition confined to local architects for

NORFOLK MARKET HALL, SHEFFIELD, Messrs. HOLMES & WATSON were first, Mr. H. J. POTTER second, and Mr. JOSEPH SMITH third. The successful competitor for

NURSES' HOME, NORTH STAFFORDSHIRE INFIRMARY, STOKE-ON-TRENT, was Mr. R. STEPHEN AYLING, amongst 38 competitors. The recent movement in favour of open-air treatment for consumptive patients led to the competition for

THE KING'S SANATORIUM, in which essays by medical men were conjoined with designs by architects, and on the advice of an advisory committee consisting of Sir WILLIAM BROADBENT, Sir R. DOUGLAS POWELL, Sir FELIX SEMON, Sir HERMAN WEBER and Dr. THEODORE WILLIAMS, the first premium was awarded to Dr. ARTHUR LATHAM and Mr. WILLIAM WEST, the second to Dr. F. J. WETHERED and Messrs. LAW & ALLEN, and the third to Dr. E. C. MORLAND and Mr. G. MORLAND; whilst honourable mention was accorded to Dr. P. S. HICHENS and Mr. R. WEIR SCHULTZ, Dr. TURBAN and Herr J. GROS, Dr. JANE WALKER and Messrs. SMITH & BREWER, Dr. J. P. WILLS and Mr. WILLS. In a limited competition for the

CARNEGIE LIBRARY, COATBRIDGE, the plans of Mr. ALEXANDER CULLEN were adopted, and premiums were awarded to Mr. A. N. PATERSON, Messrs. GEORGE ARTHUR & SONS, and Mr. ALEXANDER MACGIBBON. For the

CREWE MUNICIPAL BUILDINGS Mr. H. T. HARE was successful, and the second premium was divided between Mr. ALBERT DIXON, Messrs. BANISTER FLETCHER & SONS, and Messrs. RODNEY & DENNING. In the competition for

POLICE BUILDINGS AND FIRE STATION, SUNDERLAND, the award was Messrs. W. & T. R. MILBURN with Messrs. WILLS & ANDERSON first, Messrs. STONES & STONES with Mr. W. EDWARDES SPROATES second, Mr. ALFRED E. CORBETT third. For the

ASYLUM AT LANGHO, the designs of Messrs. GILES, GOUGH & TROLLOPE were placed first, those of Mr. E. P. HOWARD and Mr. E. R. DOLBY second, and those of Mr. J. SMITH, Mr. F. J. PARKINSON and Mr. W. STIRRUP third. The competition for

CENTRAL LIBRARY, BRISTOL, was won by Mr. H. PERCY ADAMS, the second and third premiums being given respectively to Messrs. NOTT & COLLINS and Mr. A. T. BUTLER. For

WORKMEN'S DWELLINGS IN LIVERPOOL 45 sets of designs were submitted, and on the recommendation of the assessor, Mr. THOMAS BLASHILL, the first premium was awarded to Mr. JAMES DOD, the second to Messrs. BROCKLESBY, MARCHMONT & EAST, and the third to Mr. A. MITCHELL TORRANCE. For

MUNICIPAL BUILDINGS AND LIBRARY, BARRY, the successful competitors were, first, Messrs. E. E. HUTCHINSON & E. HARDING PAYNE; second, Mr. WILLIAM H. ASHFORD; third, Mr. GEORGE DRECHIN LEWIS. The adjudication of Mr. JOHN SLATER in the competition for

WORKING CLASS HOUSES, BERMONDSEY, places first the designs of Messrs. BROCKLESBY, MARCHMONT & EAST; second, those of Messrs. HUMPHRY, DAVIS & CO.; third, those of Messrs. SILLS & LEEDS. Two of the selected competitors for the Liverpool Cathedral have come again to the fore in the competition for a new

CHURCH, CLERGY HOUSE AND HALL, Mr. W. J. TAPPER being successful, and honourable mention being made by the assessor, Mr. G. F. BODLEY, R.A., of the designs by Messrs. LUCAS & STRATTON, and of those by Mr. C. A. NICHOLSON. The competition for

MUNICIPAL BUILDINGS, PUBLIC BATHS AND LIBRARY, TOTTENHAM, elicited but a small response, nine sets of designs only having been submitted, from which were selected those of Messrs. A. S. TAYLER & A. R. JEMMETT first, Messrs. LANCHESTER, STEWART & RICKARDS second, and Messrs. CROUCH & BUTLER third.

Some important architectural works have REACHED COMPLETION in the past year. The new Opera House at York, from the designs of Mr. J. P. BRIGGS, was opened early in the year.

The new school at Horsham for Christ's Hospital, erected from the designs of Messrs. ASTON WEBB & INGRESS BELL, has been completed and occupied. The Town Hall at Colchester, by Mr. JOHN BELCHER, was opened in May. The National Physical Laboratory at Teddington, contrived out of the old Royal residence, Bushey House, has been formally opened by the Prince of WALES. A new Industrial School at Portslade for the London and Brighton School Boards has been completed. The restoration of the west front of Peterborough Cathedral has been brought to a successful termination. The new Technical School at Southend, from the designs of Mr. H. T. HARE, has been opened; and though perhaps scarcely appertaining strictly to architecture, save in its widest sense, the great walls for the regulation of the River Nile, the dams at Assiout and Assouan, have given to the world another completed monument to British energy and technical skill.

Of notable buildings actually

COMMENCED IN THE PAST YEAR

may be mentioned the Baptist Church House, Southampton Row, Holborn, from the designs of Mr. ARTHUR KEEN; a new hospital at Longridge, at a cost of over 100,000*l.*, for the Metropolitan Asylums Board; the Birmingham University, from the designs of Messrs. ASTON WEBB & INGRESS BELL; a new asylum for York, to accommodate 362 patients; the superstructure of the Royal College of Science, South Kensington, for which the lowest tender was 175,540*l.*; the Walsall Municipal buildings, from the successful competition designs of Mr. J. G. S. GIBSON; the Royal Naval College, Dartmouth, from the designs of Messrs. ASTON WEBB & INGRESS BELL; the Mount Vernon Hospital, Northwood, for the open-air treatment of 100 consumptive patients; Newport Borough Lunatic Asylum; and the new Criminal Courts in the Old Bailey, designed by Mr. E. W. MOUNTFORD.

Amongst important

WORKS IN PROGRESS

may be mentioned the extension of the new Admiralty offices; the new Government offices in Whitehall and Parliament Street; the Cardiff Town Hall; and several large speculative buildings, such as those around Finsbury Square, London, whose inception dates back to more prosperous times than the present.

A noteworthy calamity of the past year has been the

COLLAPSE OF THE CAMPANILE OF ST. MARK'S, VENICE, on July 14. A loss to Venice, to Italy, to architecture, to history, the Campanile may be rebuilt, but can never be restored. Originally not too well erected, either as regards foundation or superstructure, repeatedly struck by lightning and shaken by earthquakes, the ultimate cause of the disaster would seem to be the cutting of a chaise 35 centimetres deep across the east side for the purpose of inserting a flashing to cover the abutting roof of the Loggia, which has shared in the destruction—an instance of the evils of divided authority, of recklessness and happy-go-lucky treatment of a structure whose very survival of severe trials had apparently led to an unwise confidence in its impregnability. In our own country, the

COLLAPSE OF STAND, IEROX PARK, GLASGOW, afforded an object lesson as to the exceedingly severe stresses brought to bear on structures when a crowd is assembled and begins to sway. The lesson thus learnt was not forgotten when the stands were erected for the expected spectators of the KING'S Coronation procession, and though these, by reason of the unfortunate postponement, were less than was anticipated, the absence of disaster reflects credit on the authorities whose duty it was to see that the safety of the public was adequately safeguarded. The stresses set up in mills, factories, and workshops by the extraordinary risks caused by heavily loaded floors, and the vibration and impact of machinery in motion, received a calamitous illustration in the

FALL OF A MILL AT BELFAST,

occupied by the Smithfield Flax-Spinning and Weaving Company, emphasising the necessity not only of an ample margin of strength in the original construction, but of con-

tinuous watching and periodical inspection of such buildings. In the erection of buildings accidents are all too common, and the

MEMORANDUM OF THE HOME OFFICE AS TO ACCIDENTS ON BUILDINGS

is a document containing sound advice on detailed arrangements in the conduct of building works, which should be religiously studied and followed by all concerned, whether as contractors, workmen or architects. The

GREAT FIRE IN BARBICAN

and the even more lamentable

DISASTER IN QUEEN VICTORIA STREET, LONDON, have taught us the lesson, obvious to all fair-minded men, that neither our legislation nor our Fire Brigade administration are entirely satisfactory for the purpose of preventing undue and avoidable risk to property and to life in the Metropolis. The

ASSOCIATED FIRE OFFICES' REGULATIONS

for buildings intended to be fire-resisting contain much that is good, though it may be objected that the counsels are rather those of perfection than of commercial practicability. The loss entailed on all owners and occupiers of factories and warehouses is, however, so far beyond the mere destruction of property by fire, which is ordinarily fairly covered by insurance, that almost any expenditure of capital is wise which will obviate the ruinous loss of business during the work of reinstatement. The

HOUSING OF THE WORKING CLASSES

has continued to exercise the activity of local authorities. Some schemes have, as above noted, formed the subject of competitions, but these are scarcely indicative of the extent of the energy which is being shown throughout the country by municipalities, borough and district councils, following the lead of the London County Council, the Corporation of Glasgow, and other great bodies.

EDUCATION,

both general and special, has made several steps forward, which may be trusted to affect in the future architecture, in common with all other branches of the national life. As we have already noted, Birmingham is building an university, whilst London University has assumed the rôle of a teaching body. Liverpool has advanced towards the establishment of its university. The British Academy for the Promotion of Historical, Philosophical and Philological Studies has been incorporated, whilst, lastly, the Education Bill of the Government has reached its final stage. The bequest of Mr. CECIL RHODES, though important, will perhaps scarcely affect architecture directly. The publication of the tenth edition of the "Encyclopædia Britannica" has certainly a bearing on architecture from the value of the articles on artistic matters, which reflect the latest phase of modern thought and activity.

THE GREAT PROBLEM OF INTERCOMMUNICATION

in our congested Metropolis has somewhat, but not greatly, advanced towards solution in the past year. The new Thames Tunnel has been opened. London Bridge is in progress of being widened. Vauxhall Bridge is going on slowly, having been the subject of an engineering *faux pas* by the formation of a mistaken opinion as to the capabilities of the subsoil. The Great Northern and Strand "Tube" Railway has been commenced. On the other hand the widening of Piccadilly has for the moment been shelved, and the construction of much-needed lines in London has been postponed by the contesting tactics of financiers. The possibilities of shallow tunnels have formed the subject of a report by Lieut.-Colonel A. H. YORKE at the instance of the Board of Trade on the Chemin de Fer Métropolitain de Paris. The scheme of Sir JOHN WOLFE BARRY for a bridge across the Strand has excited considerable attention and may some day become an actuality.

THE SANITARY CONGRESS

was held at Manchester, where many useful and interesting papers were read, and a notable resolution adopted as to the value of "Garden Cities" as a solution of the housing problem and the congestion in crowded centres. The

exhibition, in conjunction with the congress, was held at St. James's Hall, Manchester, and was of more than usual interest.

THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

met during the past year at Belfast, and afforded an opportunity for the study of many remarkable works of modern architects in the Ulster capital.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS has steadily progressed without sensational incidents during the past year, and is now so financially strong that, with a capital of 11,500*l.*, and a balance of revenue over expenditure of more than 1,000*l.* a year, the question of more suitable housing is within the range of practical consideration.

THE SOCIETY OF ARCHITECTS

is still working away at the great subject of the registration of qualified architects, which, under the energetic guidance of its present president, Mr. SYLVANUS TREVAIL, it may possibly attain in the near future, more especially as it has taken the wise step of forming a committee, not limited to its own members, for pushing the matter forward. A Registration Bill for architects, promoted solely by the Society, might be expected to become law on the Greek kalends; but, backed by all those practitioners who are to-day in favour of the principle, it might take an early place amongst the statutes of the present reign.

THE ARCHITECTURAL ASSOCIATION

has successfully established its day classes, but has thrown overboard the grandiose scheme of its late president, Mr. SETH-SMITH, for new premises, and has accepted—what it might have had during the presidency of Mr. LEONARD STOKES—the gift of the Royal Architectural Museum and its white elephant, the magnificent collection of casts which the enthusiasm of the great men of the Gothic Revival brought together. All honour is due to Mr. MAURICE B. ADAMS for having seized the psychological moment to offer to the best possible custodian the valuable collection, and to solve at one stroke the problem which has vexed the souls of many successive committees of the Architectural Association by providing for it a home that should meet its needs for many a year to come.

The past year has seen in the tactfulness of our present KING the recognition of many phases of national life, and amongst them architecture has not been omitted, for in the persons of

SIR WILLIAM EMERSON and SIR CASPAR PURDON CLARKE, two architects and Fellows of the Royal Institute at the heads of their respective spheres of activity, suitable honour has been granted. Architecture has also been honoured by the election of

MR. GEORGE FREDERICK BODLEY
as a Royal Academician, and the bestowal upon

MR. THOMAS E. COLLCUTT
of the Royal Gold Medal.

Death has visited somewhat lightly the ranks of prominent architects during the past year, the most notable losses being Mr. JOHN FRANCIS BENTLEY, Mr. DAVID MACGIBBON, Mr. GOYMOUR CUTHBERT, Mr. THOMAS OLIVER, Mr. CHARLES EDWARD DAVIS, Mr. GEORGE HARRY POWNALL and Mr. JOHN HUNGERFORD POLLEN.

PROFESSOR BLACKIE AND ARCHITECTURE.

PROPOS of the title, it may be said at once that architecture to the author of "Self-Culture" was one of many topics handled by him at intervals with characteristic assurance. Usually he brought freshness and originality with him, and in this case his tastes entitled him to speak. He had a European knowledge of buildings. As a tourist, *hic et ubique* seems to have been his motto, and at fourscore he had not seen his last of the Continent with its architectural treasures. After viewing them with a travelling student's enthusiasm, he decided, and few will object, that no style is wrong or right in itself, but that

circumstances alter cases. His ideas were freely given forth whether as lecturer or author. There is the eloquent, Platonic book "On Beauty," written, he says, with his head full of pictures, statues, churches and other beautiful objects. It is a sort of pot-pourri of æsthetics. He brings the principles of congruity, variety, perfection, the sublime to bear on many matters from architecture to women's dress. Among much to which the architect will say, *Cui bono?* we find a rather happy table of architectural "harmonies." Architecture has come far since the day when it was needful to put forth some of the following dogmas. In the first place a building, while agreeing in its own parts, should harmonise with the site. A building set on a hill, *e.g.* the Calton Hill in Edinburgh, must not resemble a Manchester factory, a Prussian barracks, the palace of OTHO, king of Greece, at Athens, nor, be it said, the Calton Gaol. Secondly, a building should be in harmony with its purpose. The aspect of school grounds and architecture should be that of healthy boyhood—free, open and cheerful. Thirdly, a building must suit with climate and national character and habits. British Doric should not be polychromatic like its Greek original. Lastly, the occupant's taste should be studied, as in fact it is by a growing class of adepts.

"On Beauty," too, adduces the practical dicta of one versed in the best architecture shown by France, Germany, Italy and Greece. Its statements are occasionally more curious than convincing, *e.g.* granite is said to be always an element of the sublime. He objects that little has been done in this country to bring out the æsthetic character of brickwork, surely a hasty opinion in view of Hampton Court and WREN, that master in the medium, or the granges and cottages of Southern England. Whose taste can we trust on learning from BLACKIE that Abbotsford, "pepper-boxes" and all, was a fitting abode for Sir WALTER, the apostle of Mediævalism? Apropos of Edinburgh; he thinks that streets may be too wide, though, by the way, Princes Street, not the least fine thoroughfare in Europe, is one-sided. He is very short with shop architecture, particularly with the putting in of beams whereby old fronts give way to plate-glass. RUSKIN upbraided Classic builders for elaborating the top of their structures into cornices, &c., whereas the church artists kept the finish at eye-level. BLACKIE is not less severe on those who convert ground floors into shops thick with meretricious ornament, while the upper storeys retain their simplicity.

After all, he owns, it is not so easy to erect a perfect building. It may console some to hear that an architect who must economise on his plans is not likely to fall into gross sins of taste. But taste is all when the ambitious client gives *carte blanche*. Somewhat on the lines of HOGARTH'S view, "The False Perspective," BLACKIE gives his caricature of bad taste. A medley of styles meet in the same mansion. The windows are severally Doric, Tuscan, Ionic, Corinthian, Byzantine, Gothic. There are plain, fluted, twisted pillars; elliptical, circular and horseshoe arches; mullions, Moorish tracery. The front is topped by a pediment in one part, by eaves or balustrading in another. Lecturing once, the Professor said that buildings and women obey one law. A woman to dress well must know three things—her age, her stature and her points. As to stature, a small woman can only be pretty. An up-to-date cut and carved villa cannot vie for architectural effect with mere bulk such as Stonehenge. Size is fundamentally noble and essential in the highest forms of architecture. It is told, not very consistently with this, perhaps, that from the top of the Khufu Pyramid the Professor conceived a great contempt for its arithmetical sublimity.

Widely as BLACKIE'S taste ranged, he had a strong bent to Greek and Classic style. Now an amateur may favour Greek and Gothic indifferently because he is an amateur, but BLACKIE because of that self-styled "Grecian equipose" which resulted from his studies in the true Greek spirit. The late eighteenth-century archæologists, not to mention CHAMBERS and other practitioners, took a somewhat narrow view of style from their study of Greek monuments, which BLACKIE interpreted in a more liberal way. The Edinburgh Professor of Greek was so little a formalist that Greek syntax was said to be the only thing unlearned in his class. There the Attic tongue was less insisted upon than the

Attic genius. The relics of ancient art did not obsess him any more than say PLATO, who never cites the native temples during his inquiry on beauty. That the Greeks' legacy is adaptability, not a mode of building, is a point which needs no labouring; it is the moral of their philosophy. It was in his just sense of this that BLACKIE, admitting no hard and fast rule of style, came down upon what he considered RUSKIN's Gothic intolerance.

RUSKIN went to Edinburgh and lectured, eliciting a reply from BLACKIE on behalf of his beloved Greeks and their art. Possibly in his zeal the latter depreciated Gothic more than might otherwise have been, for he did not share the Classic GOETHE's radical dislike of that art. RUSKIN told his audience that their civic architecture went on a wrong principle. To quote BLACKIE:—"He came, like St. PAUL, to tell them that they were all given to superstition, and to say to the modern Athenians, 'I perceive that you are all particularly pleased with your beautiful city, and altogether besotted in that goodly style of architecture which we call Greek.'" RUSKIN, we know, was prepared to raze all that part of the city—the New Town—which had risen under the Greek taste of various architects. He could have joined HUGH MILLER in naming Edinburgh as one of the few great cities that would be lovely country were the buildings away. Given such a site, to find the appropriate architecture was the problem of his lectures. The actual state of things offended both taste and utility. One type of window was repeated no less than 678 times, as he found, in a single street, an abuse of Classic unity. The pillared porticoes, which lent a certain variety, were not even weatherproof. Let the next house built have a walled Gothic porch, he said, and see how the workman's fancy and skill will be elicited. As Sir R. ROWAND ANDERSON has lately repeated, inspiration must percolate downward from the artist to the craftsman. The cold taste of Edinburgh public buildings was equally reprehended, and their sculpture found wanting in the zest and fidelity of Gothic. Even from a constructive point of view, the Greek lintel was more weakly barbarous than any other system that could be named. They had the true, the Gothic models in their midst, he said, pointing to Trinity Church, since demolished. In short, the features proper to the site were those of Italian Gothic—towers, turrets, spires and belfries.

In a subsequent lecture BLACKIE probed these anti-Classic prejudices, which were due, he thought, to the prevailing rage for Mediævalism:—

Mediævalism is the grand Utopia, the cloud-cuckoo land as the Greeks called it, where we have been taught to seek for human perfection by Novalis, Frederick Schlegel, Carlyle and Ruskin, and because Gothic architecture was a glory at that period nothing else was to be tolerated now. I tell you that this talk about the Middle Ages is all pure nonsense. Who are the heroes of these times? Club law, iron fists, Jeddart justice, bleeding Waldenses, Willie Armstrong, Meg Merrilies and Rob Roy Macgregor. As to Catholic art, the Renaissance was a very sane interruption of its course though itself both pagan and profane, and as for looking on the pictures of Titian with a squeamish eye, I look on them as a very great relief after these long galleries of monks, these white-eyed, grim-faced, stupid-looking monks praying on their knees to pictures more stupid than themselves. . . . Why does Protestantism not produce as much art as the Greek religion? Because Ruskin is wrong in supposing any necessary connection between faith as faith and art as art. The more intensely faith burns the more it excludes art. Don't we all know that such a faith burned with the most gloomy and terrible earnestness on these very brown hills which we can see from our streets? The old Jew and the modern Covenanter are not artistic races. They require to get art from abroad.

RUSKIN did not strike BLACKIE as a philosopher, a historian, a logician, but as an artistic apostle and missionary. To the man who was not religious he would be apt to appear puerile. This character was the reason of his animus against the Classics and their work. HORACE, CICERO, TACITUS and LUCRETIVUS were certainly not remarkable for fervour in their country's faith. The most talented Greeks in the time of PHIDIAS were tried for atheism or irreligion. We may object to BLACKIE that for RUSKIN piety had no constructive effect upon any fabric from cathedrals downward. It operates more naturally in

detail upon ornament that is largely symbol and image. Faith must be referred from the master-builder as it were to the handiworker. He carefully adds that ornament is precisely the feature of architecture. Strip the Parthenon of colonnades, metopes and tympana, you leave a featureless face—a white box. Ornament being so important, it seems, *pace* RUSKIN, as if Grecian were not less piously meant than Gothic after all. The ox-head and patera of the entablatures repeated in so many Christian fanes were sacrificial emblems. The sculpture in the pediments conveyed parables. The eastern pediment of the Parthenon set forth the birth of Wisdom, or ATHENE. Nymphs carried the tidings, and the chariot of HELIOS, the Sun, rose over the world to proclaim it, while that of Night or ignorance descended. ATHENE strove with NEPTUNE in the western pediment which should make the worthier offering to mankind. The scandalous fables of the poets were everywhere absent, and the gods were seen obtaining homage as gods ought to do. Gothic shows, as fairly typical of western symbol, the gargoyles of Notre-Dame. So BLACKIE says that, while the Greek theology was crude and puerile, their paintings, their sculptures, even the trivial garniture of daily life were more religious than ours. If they had less morality in their temples, they had more devotion in their pictured porticoes and statued streets:—

Their religion, like all polytheism, being merely a pictorial personation of the most striking powers of nature and of the human soul, and created altogether by the devout working of imagination, could never come into hostility to any purely imaginative art; but did rather, by its very nature, constantly invite and stimulate the exercise of that devout plastic faculty, which the one-eyed sternness of certain forms of monotheism pitilessly denounces. . . . Though Christianity does in no wise expressly forbid the practice of the fine arts, it confines its soul-stirring appeals so exclusively to the conscience, and plants everything human and sensuous at such an infinite distance from what is divine, that we need not be at all surprised when we stumble on the plain historical fact, that the most intimate union of the religion of Christ with the arts of representation took place in an age and in a country where the native tendencies of the Christian faith were neutralised by a strong admixture of the outward pomp and ceremonial of heathenism.*

This has been said elsewhere, but perhaps never better. An eclectic and a modern, BLACKIE thought the RUSKIN cult of critics very unfortunate in point of their nativity as born some centuries too late. The open mind in criticism is even more a want to-day when architects can pass readily from style to style, so much so sometimes that one has seen a Gothic design become Free Classic at the expense of a little "faking" and tracing paper when it was thought proper to send in alternatives. As BLACKIE puts it enthusiastically, in a passage which it is a pleasure to revive:—

Why should the world of art be more monotonous than the world of nature? Classicalism, Mediævalism, Modernism, let us have and hold them all in one wide and lusty embrace. Were all the flowers made of one pattern to please the devotees of the rose or the lily, and all the hills with the green folds of their queenly mantles of one slope to suit the anglo-meter of that most mathematical decorator, Mr. D. R. Hay? I trow not. Let us go and do likewise. For our pictures and our poems, and our statues and our buildings, our true excellence consists not in excluding anything, but in including as much as may be of that various and exhaustless wealth of form, colour and expression in which the beautiful world has been created.

THE SCREENS IN NANCY.

AT the present day in England there is a good deal of talk about the rearrangement of streets and the formation of open spaces where two or more join. In most cases the difficulty arose out of the rapacity of land-owners. For a great many years in England they have had but one desire, and that was to use every square foot of ground for building sites. Now, when an improvement is desirable, it has generally to be obtained by a costly price to the culprits who began the wrong by laying out streets regardless of the future or of any interests but their own.

For any projector who cares to study the problem there

* *On Beauty.*

is no better object-lesson than is to be found in the streets of Nancy. It is now one of the advance guards of the French defence. There are soldiers everywhere, immense quarters to contain them, and vast open spaces for their manoeuvres. Nancy is one of the few places in France

STANISLAUS was originally a Palatine of a Polish district, but CHARLES XII. insisted on making him a king. He was unable, however, to withstand Russian and other invaders, and was therefore obliged to run away from Poland. On obtaining a life tenancy of Lorraine, his

FONTAINE DE NEPTUNE, NANCY.

where the population is increasing at a remarkable rate. The reason is, it is the nearest refuge for inhabitants of Alsace who prefer French methods of government, with all their defects, to the rigorous system which has been imposed on the country by the Germans. The existing conditions

natural benevolence inspired him with the resolve to do whatever was possible for the benefit of his subjects. He seems to have had a presentiment that the century would not close without bringing calamities to kings, and he endeavoured to remove the causes of discontent from

FONTAINE D'AMPHITRITE, NANCY.

of Lorraine are unlike those which prevailed in the eighteenth century, when King STANISLAUS of Poland was selected to be the ruler, the last who was destined to hold that dignity, for after his death the country with Nancy was united to France.

Nancy. There was in the town at that time a metal-worker named JEAN LAMOUR, many of whose works are represented in the book known as the "Recueil des Ouvrages de Serrurerie de Jean Lamour." STANISLAUS, who seemingly had a weakness for craftsmen of that class,

became a friend of the smith, and used often to visit his forge. JEAN LAMOUR, it should be observed, was the official serrurier of Nancy, and in virtue of his appointment received a retainer of 2 francs 60 centimes. The friendship of STANISLAUS for him was of the practical kind, which consisted in the giving of commissions. The first was rather curious. STANISLAUS, although Duke of Lorraine, was compelled to guarantee that he would not be buried in the chapel of the Hereditary Dukes, in the church of the Cordeliers. Hence it was necessary for him at the beginning of his reign to look out for a burial-place. He found a ruined chapel in the Faubourg St. Pierre, which he restored. In order to mark the spot where he was to repose he ordered JEAN LAMOUR to make a beautiful screen, which unfortunately has disappeared, for it was sold to a broker during the first Revolution. The success of the first screen led to orders for several others. STANISLAUS was not satisfied with setting them up in public places of the city. He made presents of screens, balcony railings and ornamental iron-work to several of the inhabitants.

MASTERS OF ART: ARCHITECTS.*

IT is not, we hope, necessary to recall at length the history of the Albert Memorial in Hyde Park, from the podium of which we have taken an illustration. When it was decided to erect the structure the design was sought through a limited competition. One by the late Sir GILBERT SCOTT was selected. In his autobiography he tells us how he experienced little difficulty in determining the class of memorial which he deemed most eligible. His first thought suggested a work of the character which is now familiar. No doubt the idea generically corresponded with an Italian ciborium; but what modern architectural work is without relationship to another of an earlier date?

At the time it was suggested that an imitation of an Eleanor Cross would be more appropriate. There were, however, reasons for the adoption of an Italian model. The Eleanor Cross was essentially a stone structure. It was recognised as likely to be more symbolic of the general interest taken by the PRINCE CONSORT in a variety of arts if scope were allowed for the display not only of stone-

APPROACH TO CATHEDRAL, NANCY.

In order to utilise his screens he made alterations in the town; one is the Place Stanislaus. In this fine open space there are some of the public buildings of Nancy, and at two of the angles we see the fountains of AMPHITRITE and NEPTUNE, the design in one instance allowing of gateways. The effect of these is not easily described. The metalwork is in part gilded, and the avenues and trees obtain a new charm when only partially seen, for curiosity is in that way excited. Another gateway shows the approach to the cathedral. Owing to the works which were ordered by STANISLAUS, Nancy has an architectural appearance which seems to be out of proportion to its importance. The population is about 100,000, but the streets possess a dignity worthy of a capital. When it was found that the last Duke was eager to expend money on the embellishment of the thoroughfares and public places the inhabitants co-operated, and the result is a small city which must be a puzzle to political economists, for there seem to be no manufactures which could support such costly buildings. The experience gained in Nancy is enough to suggest to ground landlords the advantage of generosity which may require a little sacrifice at first, but brings afterwards success.

working, including sculpture, but of various other crafts. Sir GILBERT SCOTT's design gave openings for not only architectural but engineering construction, metalwork, mosaic, gilding, inlaying, &c. The sculptor's work is mainly confined to the statue of the PRINCE CONSORT, the groups typifying the four quarters of the globe, and the podium representing the architects, sculptors, painters, musicians and poets of all ages. With such a structure as the Scott monument in Edinburgh, the numerous niches which were a necessity of its Gothic character could be filled with figures of the creations of the Wizard of the North. We can suppose that they were all visions which floated before the poet and romancist. It was impossible to have figures of a like kind surrounding the PRINCE CONSORT. It would also be contrary to British etiquette to display portraits of his auxiliaries in realising the Exhibition of 1851. The figures available for representation were rather aloof from him personally, and therefore the Italian style, with its broad planes, was better adapted to the peculiarities of the problem. Every spectator must have a different feeling before the gorgeous structure in Hyde Park compared with

* See Illustration.

that he experiences in front of one of the Italian monuments, or the memorial of FREDERICK THE GREAT in Berlin, or the Scott monument in Edinburgh. The loneliness of the PRINCE, surrounded only by types or abstractions or figures of vanished artists, few of whom are known even by name to the multitude, is suggested by the monument, and we see the—

Far-sighted summoner of war and waste
To fruitful strifes and rivalries of peace—
Sweet Nature, gilded by the gracious gleam
Of letters, dear to Science, dear to Art,
Dear to thy land and ours—a Prince indeed.

A work of the nature of the Albert Memorial was unknown in this country, and it was therefore difficult to arrange the price to be paid for the realisation of Sir GILBERT SCOTT'S design. Mr. JOHN KELK made an offer which was most creditable to him. He proposed to construct the Memorial entirely at cost price, and if after meeting all expenditure any sum remained, it was to be returned to the Trustees. It was determined that Mr. KELK should become the general contractor for the constructive parts, and include all the necessary sub-contracts in his tender. The eight groups of figures and the statue of the PRINCE were to be excluded. The price named was 85,508*l*.

In the preparation of Sir GILBERT SCOTT'S model, Mr. H. H. ARMSTEAD had given the benefit of his skill and experience. Mr. J. B. PHILIP had carried out several of the works of sculpture required in the architect's restorations of cathedrals and churches. It was therefore arranged that the two sculptors should be entrusted with the great task of the podium, which was to comprise no less than 169 figures. There is so much unity of spirit in the arrangement, the names of Mr. ARMSTEAD and Mr. BIRNIE PHILIP are likely to be always conjoined in every description of the memorial. It is well, however, to note that the series of Architects, of which we publish an illustration, as well as the series of Sculptors, were executed by Mr. BIRNIE PHILIP, while the Painters, Poets and Musicians were undertaken by Mr. ARMSTEAD. Elaborate models of various sizes had to be made by the artists, and much deliberation was necessary in order to overcome the difficulties. Among the Poets, for example, it was possible to have a central group expressive of the sovereignty of HOMER, but what man held a similar position among Architects? It may be doubted whether the representatives of the art who appear on the slab would be willing to admit any individual superiority.

In the selection of types it will be observed that historical sequence is recognised. It is a noble line of artists beginning with HIRAM of Tyre and ending with WELBY PUGIN. Sir GILBERT SCOTT is shown modestly in the background, thus suggesting that the time had not arrived for enrolling him among the masters. Opinions may differ about the impartiality of the selection of the figures. Numerically, England at one end is as largely represented as ancient Greece at the opposite end. Frenchmen consider there are not enough of their own masters. The Spaniards have still more reason to complain. It must, however, be admitted that in all similar groupings of artists, such as those of DELAROCHE, INGRES, DE KEYSER, national bias is allowed to be influential. If the relief is considered as suggesting the near and remote influences which have given character to English architecture there will be little cause for cavilling.

The position of HIRAM, or HURAM, in the relief is suggestive of his fame. As long as the world endures men will read about the Tyrian artist who prepared plans which kept 150,000 men and 3,600 overseers busy, although it may be no longer possible to form a definite vision of the buildings on Mount Moriah. So far as is known, HIRAM'S work did not affect the architecture of Europe, and it is well therefore to represent him as a solitary figure whose gaze is not in the direction pursued by the genius of architecture.

It is otherwise with the Greek artists. THEODORUS, RHOEKOS and SMILIS must have been partners, for they co-operated in the construction of the Labyrinth of Lemnos. MNESICLES was the architect of the Propylæa of Athens. METAGENES and his father, CTESIPHON, erected the Temple

of Diana at Ephesus. ICTINUS was the architect of the Parthenon, and CALLICRATES was associated with him. CALLIMACHUS is usually thought to have been a sculptor, but according to the Vitruvian legend he was the originator of the Corinthian capital. APOLLODORUS is seen bearing Trajan's Column, which he designed, as well as other works for that emperor and his successor HADRIAN. It has been said he was murdered for criticising a design of the latter. ANTHEMIUS must always be considered as one of the creators of architecture, for he was the architect of Sta Sophia. He is a connecting link between the Classical and the Mediæval periods.

SUGER entered the abbey of St. Denis when he was a child of ten; he rose to be abbot, and his name is inseparable from that monastery. He was a statesman rather than an architect, and as regent he was for a time the true ruler of France. From his position he was able to render the greatest services to art. It was not unlikely that Romanesque would become a gaunt, rigid, penitential style if SUGER had not persuaded men that sculpture and painting were not out of place in a Christian church. WILLIAM of Sens and WILLIAM the Englishman were engaged in Canterbury Cathedral; their other buildings have not been determined. ERWIN of Steinbach is another of the Mediæval architects whose names have survived. The façade of Strassburg Cathedral is a sufficient memorial of his talents, but he is commonly supposed to have designed the entire building, although he was only one among several architects who laboured there. ARNOLFO, GIOTTO, BRUNELLESCHI and WILLIAM of Wykeham stand for the other phases of Italian and English Gothic.

The Italian School is well personified by BRAMANTE, SAN GALLO, PERUZZI, SANSOVINO, VIGNOLA and PALLADIO. PHILIBERT DE L'ORME is introduced among them. That is not an error, for he was engaged for some years in Italy, and his style was more Italian than French. Next we have the Englishmen who derived inspiration from Italy—THORPE, JONES, WREN, VANBRUGH, CHAMBERS. BARRY and COCKERELL were indebted to Greece and Rome as well as to Italy. MANSART is fittingly introduced near WREN. Lastly, we have the second PUGIN, who in the nineteenth century looked on himself as the disciple of WILLIAM of Wykeham rather than of any later master.

In modelling the figures BIRNIE PHILIP endeavoured to follow portraits whenever they were available. All his figures have remarkable animation, and might be taken from life. In DELAROCHE'S "Hémicycle" the artists are supposed to be present at a distribution of prizes to students of the Académie des Beaux-Arts. It does not become monotonous when so many are seen looking in one direction, for the attention might be simultaneously attracted by a student. With the architects who appear on the podium of the Albert Memorial there could be no common purpose, indeed, there was no reason for their assembling. The sculptor accordingly was obliged to divide his figures into groups, and to represent them as if engaged in the serious discussion of principles which they held in common. About his success there can be no question. It is to be regretted that, after attaining such a height, J. BIRNIE PHILIP did not live to obtain the honours to which he was entitled.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of the Association paid a visit on Saturday afternoon to the exhibition of drawings in the National Galleries executed by students of the School of Applied Art. The exhibition is this year of exceptional interest, and the works hung are of an unusually high standard. Sir R. Rowand Anderson, who was expected to act as leader, was unable through indisposition to be present. Mr. Alfred Greig read a letter of apology for his absence, in which Sir R. Rowand Anderson suggested that the Architectural Association should appoint a committee to draw up a memorial on art education for presentation to the Parliamentary committee which is at present considering the subject of art education in Edinburgh.

Mr. A. Hunter Crawford, in moving that the secretary be instructed to call an early meeting of the Council of the Association for the purpose of considering Sir R. Rowand Anderson's suggestion, said that the work in the School of Applied Art was started with the intention of educating young men not only in architectural design and draughtsmanship, but also, and largely,

with the definite policy of teaching those desirous of preparing themselves thoroughly for the design of jewellery, furniture, stained glass, decoration, &c. That that policy had been carried out they might in that exhibition see for themselves. Certain critics, town councillors among them, had said that while they realised the excellent teaching given in the school, they were of opinion that the school was too much of an architectural academy, and that the course of instruction given in the architectural orders and styles was too prolonged and uninteresting for those who hoped to devote themselves to the allied or applied arts. Putting aside the wonderful results achieved by the architectural students of such a comparatively small school in competition with the students of all the other architectural schools in the kingdom, surely, in the first place, the director was the man to say how and what instruction should be given in order best to prepare the student for his work, and he was sure that those who had prepared for any of the applied arts in that school would realise what a benefit the teaching had been to them. Further, it should be remembered that a large proportion of architectural students never engaged in the practice of architecture, but were diverted to the drawing offices of furniture-makers, glass-stainers, silversmiths, &c., and their preliminary training formed the very best groundwork for good design in these arts. If those specially interested in the numerous applied arts desired efficient teaching in these arts, teaching on the principle originally laid down, given by those in the active practice of the work they taught, money must be spent, and if the purse-strings were held too tight they should not blame those in control of the school if they could not give all the teaching each individual student should obtain.

Professor Baldwin Brown, in seconding Mr. Hunter Crawford's proposal, said that he at first had the impression that architecture bulked too largely in the work of that school, but it was interesting to see how the school had worked steadily in the direction of study of the various industrial arts. There was, he thought, room for further development in that direction, and also that more accommodation and appliances were required. Everything in connection with art education was in the crucible, and no one knew exactly what would come out, but it would be a thousand pities if the traditions of that school should now be allowed to drop.

The motion was adopted. The members afterwards inspected the exhibits.

INTERNATIONAL SOCIETY OF ART.

THE first general meeting of the International Society of Sculptors, Painters and Gravers has just been held. Mr. John Lavery, the vice-president, in the unavoidable absence of Mr. Whistler, the president, was in the chair. Some thirty members and Associates attended and listened to the vice-president's address and the reports of the hon. secretary, Mr. Sauter, and the hon. treasurer, Mr. Webb. Mr. Sauter stated in his report that five gold medals were awarded to members of the Society who showed at Munich, and that a large number of works were sold there, as well as at Budapest, mostly for national collections, proving that, within the last eighteen months, the Society has made itself into a genuinely international exhibiting body. Mr. Webb said the Society was in a flourishing condition.

THE above cottage is built of local bricks of a good brownish colour, the margins round arches, angles, &c., only being red, tile hanging and roof of red tiles. The work was carried out by Messrs. GEO. CUMMINS & SONS, of Betchworth, from the designs of Mr. H. A. TINKER, A.R.I.B.A.

NOTES AND COMMENTS.

WE announced three months ago that the committee appointed to raise funds for the restoration of St. Thomas of Canterbury Church, in Salisbury, had entrusted the work to Mr. T. G. JACKSON, R.A. The building is in a deplorable state, and Mr. JACKSON estimates the cost of all the works required at 5,000*l.*, but the absolutely essential part could be carried out for 3,000*l.* It is not always easy to obtain even the latter sum, and the Society for the Protection of Ancient Buildings, by proposing works which are estimated to cost only 2,500*l.*, are likely to retard the reparation. The committee will, we hope, realise that the smaller sum comes from an irresponsible authority. The nave arcades have settled westward, and all the columns have an inclination in the same direction. Mr. JACKSON's remedy is the addition of substantial buttresses to the west end. The Society say the only serious cracks are at the west end, and when the movement is arrested the walls can be grouted up. The western buttresses are declared to require only underpinning, and the use of modern material as a core. The roof of the south chancel aisle, according to Mr. JACKSON, will need reconstruction. The Society affirm it can be repaired with straps and angle irons. The Society, in fact, make so little of the works demanded we are surprised to find the estimate working out at 2,500*l.*

By an arrangement with the Duke of NORFOLK, the Town Council of Arundel have acquired about 40 acres of land at Tortington, a district lying to the south of the town. In it stood a priory of the Augustinian canons which existed before King JOHN's time, but of which the date of the foundation is uncertain. It is also remarkable that the vicar of Tortington had a corrody, or right of board and lodging for himself and a servant boy in the priory; this is the more noteworthy because the parish of Tortington is of small extent, and no part could be regarded as far from the vicarage. The ground is of great use, for it will allow of an extension of Arundel, which has long been desired. The Town Council lately offered prizes for designs and estimates for laying out the ground as building sites. Thirty-three plans were sent in. Mr. C. P. WHITELEY served as assessor, and on his report the first premium of 50*l.* has been awarded to Messrs. HENNEL & SONS, 8 and 9 Essex Street, Strand, W.C., estimated cost, 6,710*l.*; and the second of 20*l.* to Mr. B. B. FRANKLIN, 21 Market Hill, Luton, estimated cost 7,698*l.* Mr. E. F. FARRINGTON, the borough surveyor of Arundel, obtained third place. The two designs and reports become the property of the Town Council. It has to be determined what use will be made of them, for it is not arranged whether the laying-out of the estate will be undertaken by the Council or by speculators.

THE Vice-Chancellor of the University of Oxford has issued a statement which suggests the necessity of an immediate outlay for building works. At the Bodleian Library additional storage is required, and the plan of an underground chamber is suggested which, with shelves, will cost 9,400*l.* The library also needs money for heating, electric lighting and fireproof shutters. The keeper of the Ashmolean Museum estimates that not less than 3,500*l.* will be required in the near future for additional cases and upper galleries to meet the rapid increase of the collections. Eventually it will be necessary to erect new exhibition rooms, basement rooms for storage, a coin room and lecture theatre. The committee of the picture galleries and the keeper of the HOPE collection of engravings also seek extension of the building. The want of lecture rooms for the use of the public teachers of the University is dwelt on. The desirability of instituting and maintaining a laboratory for experimental research in the field of psychology is urged by several professors. The urgent needs of the several departments of the University Museum would at the present time involve an additional capital expenditure of 33,000*l.*, and an annual expenditure of 3,050*l.* (representing a capital of 100,000*l.*); the future needs specified show that a further capital sum of 60,000*l.*, and an annual outlay of 4,000*l.* will eventually be necessary.

THE report from the Philadelphia Chapter which was read at the convention of the American Institute of Architects referred to the law proceedings with one of the members, Mr. ADDISON HUTTON. We have already described the circumstances of the dispute. The conditions of the competition for the Pennsylvania State Capitol were not approved by the Chapter, and notice was given to the members that the taking part in it would be considered as unprofessional conduct. Mr. HUTTON sent in designs, and when requested to resign in consequence he refused. Twenty-three members voted for his expulsion and four were opposed to the proposal. Mr. HUTTON then brought an action in the law courts for reinstatement, on the ground that the action of the Chapter in expelling him was an attempt to restrain his liberty of action, an unwarranted interference with the conduct of his business, and was beyond the powers conferred in the charter of the Chapter. A mandamus of reinstatement was issued by the Court. Mr. HUTTON was, therefore, reinstated. The Chapter, it is announced, is now taking steps for the amendment of its charter so as to prevent the recurrence of a similar defeat. That will not be an easy undertaking, for in the Courts of the United States there is a disposition to be hostile to any arrangements which will interfere with the liberty of an individual to conduct his business or profession in any way he thinks advantageous.

WHEN subscriptions are sought, as at the present time, towards the expenses of exploration in Crete, it is well that people should not forget that other countries are pursuing similar work in the island. Even the Italians, who have not surplus funds at command, are liberal in the support of their archaeological representatives. They are able to claim discoveries which are almost as interesting as those of Mr. EVANS. The Italians have also revealed a palace of a later date than that of Knossos, which is supposed to have been the summer residence of the ruler of Phæstos. In the centre of the court stood a little *megaron* or sanctuary with walls covered with stucco and which were surrounded by other walls. Near it are two rooms, one adorned with a fresco and the other with slabs of terra-cotta bearing insignia. At the entrance to the *megaron* stone candelabra were attached to the door-posts, suggesting ceremonies at night. West of the enclosure is a room containing frescoes. The subjects are landscapes, forest scenes and animals. One fresco which was injured by flames represents a man richly clad who seems to have stood up from his chair. Several objects have been unearthed, including about four hundred seals. A large fragment of black steatite is carved with several figures in excellent style, representing a band of warriors. Altogether the results of the year's work are so encouraging there will be little difficulty in obtaining funds to continue the excavations.

SKETCHES IN EDINBURGH.

IT is one of the advantages of Edinburgh that it presents several points of aspect from which views may be taken which are beautiful. But "Scotia's darling seat" can also be presented in detail, and these elements will be found unusually attractive. The High Street at one time ranked among the finest in Europe, but although it no longer holds pre-eminence, there is no doubt of its picturesqueness. In the illustration various buildings are introduced, and every lover of Edinburgh must wish that care will be taken in the future, and that no structure will be permitted to be erected in any prominent position which is not at least equal in architectural merit to those which now exist.

SKETCH SCHEME FOR TREATMENT OF AUDITORIUM, NEW GAIETY THEATRE.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER I.

INTRODUCTORY REMARKS.

IN a previous work the writer dealt with the principles underlying good planning,* and it will be well to essay a companion treatise showing the steps to be taken, though at times perhaps intuitively, to produce elevations suitable for any given plans.

It may be premised that the term "Design" is for convenience in the present work restricted to the treatment of the elevations, whether sectional or otherwise.

Some architects are said to be exceptionally adept at picturing on the "retina" of their brain the scheme in its complete form, and, it is said, can consequently lay down on paper the plans, elevations and sections without the aid of rubber—or of expletives more or less violent. These architects are, however, few in number, nor does the present writer claim to rank amongst them. To the extent that they develop truthfully and artistically the elevations from the lines and purposes of the plans, their power is an enviable one. It is not of any moment whether the successful evolution of the scheme is obtained as a result of the possession of native genius or whether it is due to a quality that is more desirable—that is, a patient training of the faculties to the requisite degree of capable knowledge; this is truly another form of genius. According to the dictum of a celebrated author, "Genius is the infinite capacity for taking pains." Even should critics demur as to the literal accuracy of this remark, it cannot be denied that there is at least a considerable substratum of truth.

Without attempting to establish in this work a standard that few would maintain in its integrity, it may yet be asserted with confidence that it is a comparatively rare occurrence at the present day for any building outside the range of ecclesiastical architecture to *combine*, in its elevations, the expression of its *raison d'être* and the truthful development of its plans. Examples there are, it is true, as witness the Natural History Museum and King's Cross railway terminus, in London, and a few others might be mentioned. And though it would be urged that, in the domain of domestic work, it is generally possible to identify houses (there are exceptions even here, be it noted), yet the interpretation of the plans in the lines of the elevations is more generally countenanced in the breach than in the observance.

Should there be any found to contest the accuracy of these views—though it can scarcely be credited that their correctness should be challenged—the objectors will be well advised to put them to the proof by instituting a critical and thoroughly impartial examination of the illustrations of buildings (with the plans attached) as shown week by week in the professional papers; the mode of reproduction is often excellent, but the designs are too frequently open to frankly adverse criticism. It must, however, be emphasised here that more attention has been given during recent years to the production of good plans than was the custom previously, and it may be hoped that the improvement will be further developed, and likewise supported by the frank expression of the buildings' plans in their elevations.

It is satisfactory to recognise our present-day freedom from the Classic shackles in which our forefathers were fettered—shackles considered more or less injurious than those of Gothic design, according to the artistic predilections of each critic. All fetters are irksome, and it is far better that a man should have the free use of his limbs (physical and intellectual) and practise restraint than that he should be restrained perforce in his practice. Can anything be more humiliating in its degree than the result of contemplating the anæmic offspring produced by architects during the earlier decades of the last century? Humiliating, it is true, but at the same time (standing on the brink of a new epoch, and glancing back across the chasm bridged by half a century of progress) there is encouragement in the perception that architects are making more or less successful

efforts to infuse vigour into their productions, and that the general public is slowly awakening from its lethargy in regard to art, and is more inclined to demand of architects a thoughtful rendering of the problems submitted to them for solution. Indeed, much that was, and still is, wrong is attributable to the general public that, wanting largely, gives but scanty, and fain would have designs sold by the yard, with a liberal cash discount allowed by the architect. This, however, is not a personal complaint, nor is this a suitable place for airing professional grievances. It is merely mentioned as being part cause of a serious evil.

It should not prove discouraging that perfection is yet so far off, and to all appearances unattainable; more benefit results from the honest effort to do good and be good than from the actual accomplishment, where effort is not needed; paradoxical as this may sound, it is, however, true, and applying forcibly to moral actions is equally valid in business affairs. Life is so restless that people confidently assert that standing still is impossible in the pathway from ignorance to the Knowledge Perfect. It must, so it is said, be a matter of either progression or retrogression. The argument will not bear too close an examination, as it leads to the inevitable conclusion that the attainment of perfection would be commensurate with the end of life, or as an alternative this quality of perfection would have to be sacrificed by retrogradation on the path to knowledge; whereas it is evident that the same qualities and activities that enable a man to obtain perfection will enable him to retain it. All that needs to be remembered is that endeavour acts beneficially both on the moral and mental fibre; and many, who through force of circumstances are unable to attain the higher reaches of intellectual progress, are carried further forward by endeavour. Dr. JOHNSON, in one of his darker moods and finer poems, wrote, "Slow rises worth by poverty depressed." Had his friend GOLDSMITH written the poem the line would more probably have read, "Sure rises worth by perseverance blessed," which is a much more cheerful thought, and acts as the pole-star on many a pilgrim's journey.

CHAPTER II.

ENUNCIATION OF THE VARIOUS PRINCIPLES.

BEFORE enlarging upon the considerations affecting design, it will be advisable to bring the principles together and to describe each concisely for the moment.

Whilst urging the simultaneous consideration of plan, elevation and section, yet it is the first that should govern the whole scheme; it is but to a modified extent that design should influence the plan. Granting this, the first points to note are that the design (a) should *express the nature* of the building, and (b) should *emphasise the plans*. One or two examples may serve at this place to illustrate these remarks; the individuals are few in number and of minor intelligence who, when walking along the Old Bailey thoroughfare in London, would fail to identify the nature of Newgate Gaol (now, unfortunately, being razed to the ground); the stern majesty of the building, the small and grated loopholes, the narrow and iron-studded doors and the heavy masonry, all serve to express the punitive character of the edifice. The Bank of England, in Threadneedle Street, is another admirable exponent of a building's purpose, just as aptly expressing an important banking establishment as Newgate suggested a gaol. For the former the requirement is not a paucity of entrances, but good centralised control, and whilst the Bank of England possesses adequate means of entry from and exit to the street for business purposes, unauthorised means, such as windows would supply in opening on to the public streets, are entirely denied to the ground floor; and if only in this respect, the building more aptly expresses a banking establishment of importance than do most of such structures, and is consequently more expressive than in the days when it possessed ground-floor external windows.

Birmingham Town Hall may be instanced as failing to express the purpose of the building.

Emphasis of plan is one of the guiding principles of correct design, but does not need enlargement at this stage.

* *The Principles of Planning.* (Batsford: 1901.)

The relation of a building to its immediate neighbours has to be considered, not so much respecting "style" (for both contrast and uniformity have their respective advocates and advantages) as on account of *scale* and *perspective effects*.

Balance, Unity, Variety, Contrast are all most valuable qualities in design.

Proportion is second to none in importance. The relation that "scale" implies between two adjacent or neighbouring buildings in regard to size and status, Proportion similarly implies respecting the interrelation of the various component parts of any building.

Projections and *Chiaroscuro* may be fitly associated here in the enumeration of the "principles."

Applied decoration and its limitations provides ample food for thought, and is to be considered under the headings of surface, relief, inset and sunk-relief treatment.

Fitness requires inclusion, and is intimately associated with the "expression" of a building, as elsewhere dealt with, and implies that a building should be scaled in accordance with its own status.

The adjustment of attenuated and latitudinal effects will require notice, and the treatment to be accorded to *Utilitarian features* will be dealt with.

1. Expression of the building.
2. Emphasis of the plans.
3. Fitness of the elevations.
4. Balance and Proportion.
5. Consideration of sections and of roofing system.
6. The effects of economy.
7. The limitations imposed by materials.
8. Unity, Variety and Contrast.
9. Perspective effects.
10. Permissible modifications of plans.
11. Scale.
12. Adjustment of attenuated and latitudinal effects.
13. Treatment of utilitarian features.
14. Individuality.
15. Projections and Chiaroscuro.
16. Applied decoration.

It may be mentioned here that, wherever feasible, the author has introduced, amongst others, in this work the designs of those buildings whose plans appeared in the former book written by him on the subject of Planning. Some of the designs are plain in the extreme, as witness King's Cross railway terminus (fig. 1), but in this example, and in others, the recommendation lies in the successful expression of the purpose of the building.

FIG. 1.

GREAT NORTHERN RAILWAY TERMINUS, KING'S CROSS, LONDON. [Lewis Cubitt, Architect.]

The consideration of *sections*, and of *roofing system* and *permissible modifications of plans* are notable factors in design. The limitations imposed on design by *materials* have to be noted, and a chapter is devoted to *fenestration* and *portalage*.

The use of *symbolism in art* is also dealt with, and may prove a valuable factor in design if employed sympathetically.

Such matters as monotony, recurrence, deception, conceits and *Individuality*, and the treatment to be accorded to terrace houses are also introduced.

The effect that *economy* has on design is probably more marked than the effect produced on planning, at least, to the casual observer, and its consideration has to be pursued on very different lines.

The qualities included in the foregoing paragraphs vary considerably in importance, and will be dealt with in the following pages without close regard to priority in that respect; but it will be well to attempt at this place to tabulate them in order of precedence—an attempt that can be only partially successful, as may be readily understood:—

CHAPTER III.

EXPRESSION, EMPHASIS, SCALE AND ECONOMY.

OF the principles mentioned in the previous chapter there are four that with justice may be termed altruistic, as in their cases they strive to consider in the first place interests other than their own. This quartette consists of:—(1) Design to express the nature of the building, (2) design to emphasise the plans, (3) scale, and (4) economy.

By the term "expression" is to be understood the quality that accentuates the purpose of any building, so that the use for which the latter is destined may be readily understood. Mention has been already made of Newgate Gaol (erected 1770-82 from designs by GEORGE DANCE the younger), and an illustration will be better than prolonged comment (fig. 2).

It may be asked, "What are the qualities which, in the first instance, stamp a feature or a defined assemblage of features of a building as being appropriate to or indicative of some specific purpose?" The answer to such a question depends to a great extent on the particular

features, but it may be stated briefly that expression of purpose may result from (a) inherent suitability, (b) conjunction of features, (c) prescriptive use, or (d) from any combination of the preceding. The first is almost self-explanatory; for the second, the use of tower

recognised as belonging to a church, whilst (b) might equally well be attached to public buildings, though it is actually a church tower. The contention will be still further supported by noting the tower in the next figure, belonging to Cardiff Castle (fig. 4).

Front Elevation of Newgate, London.

FIG. 2.

and lofty spire as a unit may be cited. There are many examples of towers used for secular, collegiate and other buildings, but the combined use of tower and lofty spire

Expression of purpose by means of prescriptive use has little to recommend it logically, but is of great sentimental value, and where disregarded can scarcely fail to produce

FIG. 3.

FIG. 4.

at once suggests an ecclesiastical edifice. In the accompanying fig. 3, if seen from a distance, (a) would at once be

an unpleasing impression on all who value this quality. The writer has in mind a rectory house in the City of

Cobbold Road Board School,
Chelsea, London:
Architect: T. J. Bailey, F.R.I.B.A.

FIG. 5.

FIG. 6.

London that has externally the appearance of having been formerly a church, and its present use as a dwelling-house is repugnant to good taste, even in the absence of definite knowledge of its previous condition.

Some further illustrations will be advantageous. Firstly, consider a typical Board school; the requirements are plenty of properly-disposed window-lighting, central hall (or halls), classrooms and schoolrooms, separate departments for infants, girls and boys, good playgrounds, economical planning and design, &c. If therefore a building is observed divided into three storeys, each one a replica of the others, important central block, and with a treatment evincing a regard to economy, isolated, and in the midst of playgrounds, a school building is at once suggested, and, at the same time, one that is based on a cut-and-dried system. But it may be urged that schools other than those of the public elementary type have requirements of a nature more or less similar, and are also worked on a cut-and-dried system (as, for instance, those belonging to the Girls' Public Day School Company), and, consequently, an element of uncertainty would be introduced. A difference of great import should be at once apparent, for in the rate-supported buildings the object should be to obtain a plain serviceable structure. Another distinction would be that the system of teaching in the higher-class schools differs from that employed in elementary schools, being less hide-bound, and the separation into departments is, of course, non-existent; the stereotyped open playgrounds would likewise be absent from these higher-class schools. Illustrations of a Board school (fig. 5), and a private school (fig. 6), appear in the accompanying figures.

(To be continued.)

ELECTRIC-LIGHTING ARRANGEMENTS IN FLATS, OFFICES AND RESIDENCES.

By F. J. WARDEN-STEVENS, A.M.I.M.E., A.M.I.E.E.

THE arrangements herein described for the supply of electricity for lighting purposes are worthy of consideration by architects and owners of residential flats, offices and such like buildings.

There is no reason why the tenants should not be provided with all necessities such as hot and cold water, heating and lighting, the rates or charges being paid with the rent. This relieves the tenants of the trouble of dealing with independent rates and other parties than the landlords.

Hot and cold water are generally dealt with in such a manner, and heating is usually arranged by open fires, except for the corridors, and in some cases pipe or radiator heating is arranged for in the individual rooms, a quarterly charge being made with the rental of the flat or suite of rooms.

Now as regards lighting, this is most frequently dealt with in a manner similar to ordinary buildings, the charges being collected by the supply company or by the landlords

as collectors on behalf of the supply authority. If, however, the supply authority deals directly with the landlords and the landlords attend to the individual tenants, there is an advantage to all concerned, as will be herein shown. By such a system the supply company or authority avoid the expense and inconvenience of individual meter reading and maintenance, also the collecting of small accounts, and have only one meter and one large consumer to deal with (the landlords). The landlords can no doubt arrange special terms with the supply authority and thus obtain their advantage in, as it were, retailing the supply, although the tenants do not have to incur any greater expense than they would if dealing direct with the supply company. A further considerable advantage can be insured by the landlords if the supply is obtained on the "maximum demand" system.

In connection with the maximum demand system it will be well to give an example of what can be done without any detriment whatever to the tenants where the supply is given on this now almost universal system. The owners of the buildings can purchase all the electricity required for the whole of the buildings on this system, and supply to the individual tenants at the same rate and yet insure financial advantage. The reason for this is that a number of tenants combined do not produce as large a maximum demand on the main meter as the sum of the individual maximum demands would amount to, owing to the fact that the times of the maximum demand of the individual tenants do not coincide. This being the case, the owners purchase a greater proportion of electricity at a lower price than each tenant could do. As an example the following case might be cited, based on the actual figures obtained in a private residence.

Assume thirty tenants each having twenty-four lamps of 8 candle-power, using as a maximum fifteen lamps at one time in the summer and seventeen at one time in the winter. The total consumption is seventeen units per lamp per annum, five in the summer half-year and twelve in the winter half-year, which is equal to three hours in the winter and 1¼ hour's use of maximum demand in the summer. If the charge is 6d. per unit for the first 1½ hour's use of maximum demand per day and 2d. per unit for all further use, the thirty tenants themselves combined would have to pay for 3,600 units in the summer half-year and 8,640 units in the winter half-year.

The summer half-year units being all at 6d. (not more than 1½ hour's maximum demand)	£90
The winter half-year units being half at 6d.	108
and half at 2d.	36

Exclusive of the individual meter rentals £234

Now the maximum demand on the main meter would amount to about three-quarters of that on the small individual meters, so in the summer the maximum demand for all the tenancies would be three-quarters of 450

lamps, that is, 338, and in the winter three-quarters of 510, that is, 383 lamps. The 338 lamps would use 2,960 units if in use $1\frac{1}{2}$ hours a night, and the 383 lamps 3,355 units. The year's account would thus be:—

Summer half-year, 2,960 units at 6d.	. £74 0 0
and 640 „ 2d.	. 5 5 8
Winter half-year, 3,355 „ 6d.	. 83 17 6
and 5,285 „ 2d.	. 44 0 10

£207 5 0

The owners thus pay 26*l.* 15*s.* less than the tenants would have to do individually, and the difference would pay for the corridor and staircase lighting if no charge is made to the tenants for this. The owners may provide the tenants with meters at rentals insuring 10 per cent. on the capital expenditure of the same as charged by the company, so they have no extra capital to provide for out of the profit. In blocks of industrial dwellings there are cases where a somewhat similar arrangement is carried out with prepayment meters; thus electricity is obtained at say 6*d.* and 2*d.* per unit on the maximum demand system and supplied to the tenants at a uniform rate of 6*d.* per unit, which includes meter rental and hire of electric-light fittings. The charges are collected by the owners, who are sure of payment in advance, and the reduced rate obtained by the landlords on the maximum demand system pays interest on the cost of fittings, meters and wiring. Again, an example may be of interest.

With a set of twenty dwellings in a building, each having five lights, the cost of wiring 100 lights, including plain fittings, lamps and shades will be about 80*l.*, the cost of twenty prepayment meters about 60*l.*, making a total cost of about 150*l.* with extras. The electricity account received will be approximately as follows:—

Summer, 100 lights at 5 units per lamp	. 500
Winter, 100 lights „ 12 „ „	. 1,200
	1,700

that is, 1,700 units at 6*d.* per unit—42*l.* 10*s.* collected from the meters.

The actual maximum demands would be 46 and 53 respectively on the main meter, allowing three-quarters of the sum of the total. The payments made by the owners thus amount to the following:—

Summer, 46 lamps, $1\frac{1}{2}$ hour a night,	
use 403 units at 6 <i>d.</i>	. £10 1 6
and 97 „ 2 <i>d.</i>	. 0 16 2
Winter, 53 lamps use 464 units at 6 <i>d.</i>	. 11 12 0
and 736 „ 2 <i>d.</i>	. 6 2 8
	£28 12 4
Meter rental 0 16 0
	£29 8 4

Leaving a balance of 13*l.*, or over 8 per cent., on the 150*l.* capital outlay.

There is yet another method by which a saving may be effected, applicable for such a number as, say, a minimum of twenty tenants. This is by the installation of a battery of accumulators on the premises supplied on the maximum demand system. Taking the first case again, it is easy to arrange that the maximum demand shall be very low indeed, or really just sufficient to take the electricity required in, say, 18 hours at a steady rate. By having a battery involving an outlay of about 350*l.*, the maximum current required is equal to that necessary to deliver 2 units per hour in the summer and $4\frac{1}{2}$ units per hour in the winter; 20 per cent. extra units may be allowed on account of losses in the battery. The cost of current would thus be:—

Summer { 548 units at 6 <i>d.</i>	. £13 14 0
3,772 „ 2 <i>d.</i>	. 31 8 8
Winter { 1,233 „ 6 <i>d.</i>	. 30 16 0
9,135 „ 2 <i>d.</i>	. 76 2 6

£152 1 2

The tenants pay as before 234 0 0

Balance £81 18 10

Depreciation of battery 35 0 0

£46 18 10

This system allows a profit of 10 per cent. on the capital invested, after allowing, say, 10*l.* for attendance (occasional). It may be here mentioned that the higher the first rate and the lower the second rate of the maximum demand system, the more advantageous these arrangements become. A very usual figure is 7*d.* per unit for the first hour and a half, and $1\frac{1}{2}$ *d.* for all further units used, and in this case the above figures would show even more favourable results, because by these means the quantity paid for at the higher price is reduced. Further, the benefit is, of course, universal where the diversity of the times of maximum demand of the tenants is greater. For instance, in a building or block containing both offices and residential flats, the former have their maximum demand at about 5 P.M. in the winter and the latter much later in the evening. The maximum demand on which the owners would pay is therefore not by any means the sum of the office and residential maximum demands.

It is always advisable to adopt the first-mentioned system, but there is a further advantage with the battery system, as it prevents absolutely a cessation of light if the public supply should fail temporarily, and this must be taken into consideration—in fact, in most cases the battery should be adopted additionally in any large buildings, merely to insure this, if the scheme is properly investigated by an engineer and he reports that no loss will be incurred. The figures which should be carefully noted each quarter are the following:—

Each tenant's maximum demand as shown by the indicator, and the units used in that quarter. The same information must be noted for the owner's main meter and demand-indicator.

The staircase and lavatory lighting should be connected to a separate meter, and treated just as another tenant would be, to insure proper results.

In any case, whether the supply company or the landlords deal with the individual tenants, it is necessary to have the wiring in the building carried out from the point of entry of the company's mains to the individual flats, and usually it is necessary to wire the various tenements, although fittings are not necessarily provided. The carrying out of this wiring is a most important matter, and as the distances are often considerable it is most advisable for the owners to obtain expert advice for the design and supervision of the work. The fire risk is also an important point requiring attention, and with properly designed electrical work insurance companies will in a large building grant specially low rates. The advantages of electric lighting to the landlords are safety, cleanliness and attractiveness. The second point, that of cleanliness, is one of great importance, and the sole use of electricity can be insisted upon, the tenants carrying out their own decorative work as an alternative.

The system of wiring adopted for each building will depend so much upon local conditions that it is useless to discuss it. It is an important point, however, to remember that the placing and proper control of staircase and corridor lights will be a great factor in the working expenses of the establishment. As regards lavatory lighting, it is not advisable to leave these either continually illuminated or under the control of the tenants, and it is very necessary to provide automatic door switches so that they are only alight when actually required.

If the demand is of sufficient amount or the supply authorities' rates somewhat high, then it becomes a great question whether considerable advantage cannot be gained by the landlords in adopting their own plant and dispensing with the supply from the public mains. This is of course a question for an expert to decide, and depends on the particular conditions. It is always necessary in such buildings to have mechanics to look after the general structural repairs and renovations, also to attend to the water fittings, heating and hot-water supply, so that it is possible to have electric lighting from private plant with a very slight increase in the wages account. In anticipation of such a course being adopted at any time it is always wise when designing the buildings to allow for or to build a large chimney and provide space in a suitable position for the plant sufficient to supply the lighting privately. The chimney will, of course, be required for the heating plant, &c., and the extra outlay when building will not

be considerable. This leaves it open for the introduction of the electric-lighting plant later with little outlay beyond its own cost. It must be remembered in this connection, however, that there is every prospect of a combined plant for heating, lighting, water supply and lifts being successful where either item taken by itself would be expensive. The writer has for some time given special attention to the financial aspect of combination schemes such as these for large buildings, and it has been found by him that there are many cases where it is really economical to discard the supplies of water, electricity or hydraulic power from the public supply companies. The reason is that heat and hot water cannot be purchased in this country, and in consequence boilers and chimneys have to be provided, steam must be supplied for radiators, skilled men are permanently engaged, and a department should be established to control the services. Consequently it involves comparatively little extra capital outlay to have an electrical and pumping plant, and the fact that the exhaust steam from the pumps and electric-light engines usually is sufficient to supply all the heat wanted, makes such economies possible that the result is generally satisfactory from all points of view.

The writer trusts that he has succeeded in bringing forward the importance of such arrangements and the advisability of owners and architects having the question carefully considered by an expert, bearing in mind the development of the large blocks of residential and office buildings, and that it is most essential in these days of competition for working economies to be effected.

IMPROVEMENT OF BRIDGES.

ON the subject of the recent decisions by various Highway Authorities affecting bridges, of more or less historic interest, under their control, a correspondent sends us the accompanying photographs, taken with the object of throwing some light on the merits of one or two cases in point. Kingston Bridge, the subject of figs. 1 and 2, already, it is said, condemned to destruction, is in point of architectural merit much superior to Richmond (fig. 3), while the latter, far inferior in artistic merit, has recently been granted a new lease of life. A holiday ramble in the Yorkshire dales (where the demands of the traffic of the last

FIG. 1.—KINGSTON BRIDGE.

FIG. 3.—RICHMOND BRIDGE.

FIG. 2.—KINGSTON BRIDGE.

FIG. 4.—OLD YORKSHIRE BRIDGE.

two centuries, upon the rather inadequate bridges of the fourteenth and two following centuries, has caused them to be widened and regraded) provides fig. 4, which suggests a possible way of avoiding the destruction of bridges such as Kingston (of which there must be not a few still capable of centuries of good work), and at the same time providing for modern requirements of traffic at less cost, material and æsthetic, than building a new bridge by destroying an existing one of artistic merit and sound construction. Fig. 4 shows the old Yorkshire bridge widened, new parapet added, and approaches regraded by adding an arch at each end, thus reducing the steep ascent and descent on either side.

THE CRETAN EXPLORATION FUND.

IN a letter to the *Times*, Mr. George A. Macmillan, treasurer of the Cretan Exploration Fund, writes:—You were good enough to print in your issue of December 22 a summary of the brief report recently issued by the managers of the Cretan Exploration Fund, giving in outline the work hitherto accomplished and what still remains to be done.

My excuse for troubling you with this letter is that by an oversight it is nowhere stated in the report in question to whom the further subscriptions which are so much needed should be sent. May I then say that subscriptions can either be paid direct to the account of the Cretan Exploration Fund, at Messrs. Robarts, Lubbock & Co., Lombard Street, or be sent to myself, at St. Martin's Street, W.C.?

I cannot, as I am writing, omit to urge once more how important it is that funds should be forthcoming to complete the excavations at Knossos and to pursue the work of exploration on other Cretan sites.

Since Schliemann's great finds at Mycenæ no discoveries of the kind have excited so much attention in all parts of the world as those made by Mr. Evans in unearthing the marvellous prehistoric palace at Knossos. The work has been costly, but the results have far more than justified the outlay, and it would be little short of disgraceful if in this wealthy country adequate funds could not be provided to carry the work to a triumphant conclusion.

A year ago I felt obliged to point out to your readers that in his determination to prosecute his brilliant researches the explorer had drawn largely upon his own personal resources. This has again been true during the season of 1902, so that the managers of the fund desire to raise not only enough to complete the excavation of Knossos (certainly not less than 1,000*l.*), but also, if possible, at least another 1,000*l.*, and preferably 1,500*l.*, to recoup Mr. Evans so far for his outlay. It is certainly not right that he should be allowed to bear so large a proportion of the cost of his undertaking, besides giving, year after year, so many months of personal labour to its supervision.

It has been decided to set aside during the coming season the sum of 200*l.* for the further excavation, under the guidance of Mr. Carr Bosanquet, director of the British school at Athens, of the site of Palæokastro, on the eastern coast of Crete. Here there is every reason to hope for discoveries which will add much to our ever-increasing store of knowledge in regard to the early history of civilisation in the Levant.

To attain the various objects which I have touched upon we shall need during the next few months not less than 3,000*l.*, and we cannot at the present time reckon upon more than 300*l.* Need I say more to show the urgency of our case?

P.S.—Those who do not already know something of the discoveries at Knossos, and even those who do, will have an admirable opportunity of examining the results at an exhibition to be held at Burlington House during the month of January, as part of the Winter Exhibition of the Royal Academy.

THE AMERICAN INSTITUTE OF ARCHITECTS.

THE thirty-sixth annual convention of the American Institute of Architects was held in Washington in the New Willard Hotel. The first session was opened with an address of welcome by Colonel John Biddle, U.S.A., engineer commissioner of the district of Columbia, and was followed by a short address by the Institute's president, Mr. Charles F. McKim. The remainder of the morning session was devoted to reports by various officers and committees. In the afternoon, following the appointment of several committees, papers were read on the "Improvement of Washington," by Messrs. Daniel H. Burnham, Frederick Law Olmsted, jun., and Charles Moore.

It has long been realised by those competent to judge that Washington cannot be favourably compared, in point of beauty, with the capitals of the larger foreign countries. The subject of the improvement of our national capital, says the

Engineering Record, has been strongly urged by many leading architects, and the admirable work of the Institute along this line deserves acknowledgment. As a step in the right direction it is a source of gratification to note that the House passed the Senate bill authorising the erection of the 4,000,000 dols. union railway station in Washington. In the evening the members assembled in the Congressional Library and viewed drawings and models submitted by the Park Commission, Messrs D. H. Burnham, C. F. McKim, Augustus St Gaudens and F. L. Olmsted, jun. An explanation of the proposed plans for the improvement of Washington's park system was made by one of the members of the commission.

The principal feature of general interest in the morning meeting of the second day was the paper by Captain John Stephen Sewell, Corps of Engineers, U.S.A., on "The Relations of the Architect and the Engineer." Captain Sewell, as an engineer, was closely associated with the architect in building the new government printing office, consequently his views had the weight of a personal experience. Among others, two points were particularly emphasised: the advisability of retaining a government engineer on all government buildings, rather than allowing the architect to select an outside engineer; and the desirability of having the work on government buildings entirely in the charge of a construction bureau, which could control all disbursements and secure the best possible co-operation among the architect, engineer and contractor. A paper by Mr. J. L. Smithmeyer on "The Development of Architecture" was read by Mr. George O. Totten, jun.

The "Development of Municipal Improvement" was the general topic considered during the afternoon session, December 12. Mr. W. B. de las Casas read a paper on "The Organisation for Municipal Improvements," the particular work treated being the Boston park system, of which he has had charge as chairman of the Metropolitan Park Commission. Under the subject "The Modern City" Mr. Albert Kelsey showed in what ways foreign city work is ahead of American, and urged the need of modern ideas along original lines in our architecture. Mr. Kelsey is in charge of the park improvement work in Philadelphia. A third paper, written by Mr. Owen Fleming, of London, was read by Mr. Glenn Brown. It dealt with the improvements put into effect in that city.

The next day's meeting was late in opening, as the earlier part of the morning was spent in visiting the White House. Mr. McKim, to whom the work of remodelling the White House was unreservedly committed, guided the delegation, and its members declared themselves greatly pleased with the results accomplished. The morning meeting closed the balloting for the election of officers. Last year's board of officers was re-elected, together with three elections to honorary membership. Cleveland was chosen as the place for the next convention, with St. Louis as the probable convening point for the year following. A paper by Capt. Charles D. Sigsbee on certain improvements in Washington was read by Mr. Arthur Totten. Capt. Sigsbee suggests the construction of a permanent reviewing stand on Lafayette Square in front of the White House, the stand to be made of marble and highly ornamental. The committee in charge of the subscription for the purchase of the historic Octagon house in Washington as a permanent institute headquarters reported that 17,000 dols. was in hand. After the purchase money (30,000 dols.) is raised, it is proposed to raise a sum of 250,000 dols. for the establishment of a benefit fund.

DUNSTAFFNAGE CASTLE.

WHETHER or not Dunstaffnage is entitled to be described (as it has been) as "our oldest Royal Scottish Castle," is a point, says Mr. I. Robertson in the *Scotsman*, as to which there is room for very grave doubt, but no one will question for a moment the claims of this ancient Highland fortress to historical interest. The famous stronghold which formed the original of Sir Walter Scott's "Ardenvoth" has figured in some stirring scenes not only in clan warfare, but in our turbulent national history. And those who seek to have the ruins restored, and the edifice put into a state similar to the English castle of Carisbrooke, will have the good wishes of all who take an interest in our Scottish history and antiquities—including those who have the temerity to hold that its claims to the status of an ancient royal residence rest on a foundation as unreal as the existence of those shadowy monarchs who are said to have inhabited it.

Truth to tell, the early history (so-called) of Dunstaffnage is as legendary as the early Scottish sovereigns whose portraits decorate the picture-gallery at Holyrood are mythical. In both cases we are indebted largely, if not chiefly, to the ingenious Hector Boece. The original castle is said to have been founded by Ewin, a Pictish monarch, who is alleged to have flourished about the same period as Julius Cæsar. Holinshed in his chronicles (following Hector Boece, of course) relates that this King Ewin "buided a castell not farre

from Beregonium, which he named after his own name, Eunionium; but afterwards it was called Dunstafage, which is as much as to say, as Steenens castell, which name it beareth at this moment." Ewin is said to have been buried at Dunstaffnage, and several subsequent monarchs are also alleged to have been buried at the same place. In the "Description of Scotland," which we derive from the same veracious source as the account of the foundation of Dunstaffnage, we are supplied with the information that "beyond Lochtie is the castell of Dunstafage, in time past named Eunionium; beyond Dunstafage also is the mouth of the water of Spanze, where it falleth (as I heare) into the Germane Ocean."

According to the legendary accounts of the castle, it was occupied as a royal seat by the later Dalriadan kings right down to the time of Kenneth MacAlpin in the ninth century. One of the traditions regarding the Coronation Stone, which now rests in Westminster Abbey, is that it was kept at Dunstaffnage, and was removed from that castle to Scone by Kenneth MacAlpin. That statement, however, rests upon the authority of Hector Boece alone. As Skene has pointed out, the older chronicles say nothing of this. Another account of the alleged "Lia Fail," or Stone of Destiny, is that it was taken from Iona to Scone. But there are many legends regarding the Coronation Stone, and the majority of persons probably are very sceptical as to it being the alleged "Lia Fail" at all—some holding that the Stone of Destiny never left Ireland. Be this as it may, there is little authority indeed for holding that the Coronation Stone (whether it is the veritable "Lia Fail" or not) was ever at Dunstaffnage. Skene declares very emphatically that it "never was anywhere but at Scone, the 'sedes principalis' both of the Pictish and of the Scottish kingdoms." The claims of Dunstaffnage to be regarded as a royal castle are dismissed contemptuously by the same high authority in his preface to the "Chronicles of the Picts and Scots," with the remark that "of Dunstaffnage as a royal seat, history knows nothing." In the face of a declaration so emphatic by such an expert as Skene, it requires some courage to continue to assert that the famous Celtic fortress was a royal castle. Still there are Highland enthusiasts who cannot believe that the legends and traditions so dear to them are mere fictions. Many of these legends are enshrined in old Celtic rhymes, which have become part of the faith of the people. A well-known Gaelic rune with reference to the M'Gregor runs:—

Offspring of our country's kings,
Whose seat was at Dun-staffnage,
That first the Crown of Alba wore,
And still have native claim to it.

It is really very doubtful, however, whether the neighbouring castle of Dunolly, at the entrance to the Bay of Oban, long "the chief stronghold of the tribe of Lorn," does not possess higher claims to antiquity, and even to an old royal connection, than that of Dunstaffnage. Dunolly is said to have been built by Selvach, Selbac, Selbagh, or Selnad, son of Fergus, king of Dalriada. In the ancient "Annals of Tighernac," we read that "Dunollaig construitur apud Selbacum. Ailen na ingen struebatur;" and the "Annals of Ulster" state that "Destructio Dumonlaigh apud Sealbach." In neither of these "Annals" is there any reference to Dunstaffnage. But it is unnecessary here to go into the claims of Dunolly as the rival in antiquity of the more famous castle.

At whatever date the original castle was built, there seems to be no doubt that there was a stronghold here as early, at least, as the ninth century. No doubt it was made use of in defending the country against the Vikings, who, about this period, made bold descents upon the western coasts, and ravaged the land. In all likelihood it was afterwards altered and enlarged, possibly also rebuilt to some extent at various times. It came into the possession of the Macdougalls, Lords of Lorn, and one of the most notable events in its authentic history was its siege by King Robert Bruce shortly after he defeated John of Lorn at Cruachan. Barbour, in "The Bruce," after giving his spirited account of the battle in the pass, goes on to say:—

The king that stout was, stark and bald,
Till Dunstaffnynch richt suddanely
He past, and segit it sturdely,
And assalzeit, the castell to get;
And in schort tyme he has thame set
In sic thrang, that tharin war than,
That, magie thairis, he is van;
And a gud vardane thair-in set,
And betaucht hym bath men and met,
Swa that he thair lang tym mycht be,
Magre thaim all of that cuntre.

Dunstaffnage was at this time the principal fortress of the Macdougalls and appears to have been a place of considerable strength, so that its reduction was a matter of great importance to Bruce. After it had been forced to surrender it was conferred on Sir Archibald Campbell of Lochaw. Sir Archi-

bald's descendant, Colin, first Earl of Argyll, in 1495 made a grant of Dunstaffnage to his younger son, Alexander, and since then it has continued to be held by a branch of the great family of Campbell. James I of Scotland, when trying to put down the anarchy and turbulence which existed in his time as in that of many of the later Scottish sovereigns, took up his residence in Dunstaffnage, and there received the submission of a number of the chiefs. The castle gave refuge to James, Earl of Douglas, after his forfeiture, in 1455, and here he took counsel with Donald, Earl of Ross and Lord of the Isles. But it was too remote to play any prominent part in later national history. During the Jacobite risings of 1715 and 1745 it was occupied by the Government troops as a military post, and perhaps the most noteworthy incident in this connection is its association with Flora Macdonald, who was confined here for a short time in the summer of 1746.

Among others who have assisted in giving an atmosphere of fictitious antiquity to Dunstaffnage Castle is James Hogg. In his "Queen Hynde" he depicts the young and beautiful queen as fleeing from Beregonium (the "Selma" of Ossian) to Dunstaffnage. This, be it remembered, in the time of Columba, who is a prominent character in the poem.

Situated on a small rocky promontory, close to the shore of the estuary of Loch Etive, and about 3½ miles N.N.E. of Oban, the ruins of Dunstaffnage Castle form a striking feature in the landscape. The insulated rock on which the castle stands is not of great height, but has been artificially scarped, so as to render it virtually inaccessible. Sir Walter Scott gives an excellent pen-picture of the castle in "A Legend of Montrose," in describing the arrival at Ardenvohr of the redoubtable Dugald Dalgetty:—

"Ardenvohr . . . rose high above him when he came upon the deck of the galley. It was a gloomy square tower of considerable size and great height, situated upon a headland projecting into the salt-water lake, or arm of the sea, which they had entered on the preceding evening."

In the near vicinity, on the east, is the peculiar round eminence on which Dalgetty insisted that a scone should be erected, and which formed the ground of his characteristic remonstrance with Sir Duncan Campbell "touching the round monticle of Drumsnab." To the left of Dunstaffnage are the ruins of a small chapel, which, according to legend, formed the burial-places of some of the ancient kings of Scotland, Pictland or Dalriada.

The castle probably acquired its present form—or rather the form in which it stood before it became a ruin—somewhere about the twelfth or thirteenth century, although parts of it are older. It is square, and the walls, externally, measure about 270 feet round, while the circumference of the crown of the rock on which it stands is 300 feet. The internal measurement of the castle from wall to wall is 87 feet. The walls are 9 feet in thickness and from 30 to 70 feet high. At three of the angles are circular towers, and there seems to have been a drawbridge at the main entrance, which faces the sea. At present the castle is simply a shell.

But a very picturesque and interesting old Highland relic is this ancient castle of Dunstaffnage. It requires no fabulous history to make it attract visitors. It is a matter for sincere regret that it should have got into its present condition, and the promoters of the scheme for its restoration will have many well-wishers.

THE RELATION OF NATURAL TO ARTIFICIAL BEAUTY IN LANDSCAPE.

THE late Mr. Walter Cope, the American architect, is described by the *Architectural Review* of Boston as exercising the kind of influence which goes far to elevate ideals. His architecture is said to be that of a master, devoid of plagiarism or of sensationalism, simple, direct, sincere, and with the added charm of the studious and earnest habit of the man and the refinement of his nature. Unembarrassed by the formulas of schools, and unsympathetic with the mere clothing of architectural styles, he seems to have grasped the fundamental axioms of his art, and then developed them with the delicate touch of his imagination. In this regard the eminent sanity of his work is as marked as its unusual artistic merit. A report is given in the same periodical of an address delivered by Mr. Cope before the Fairmount Park Art Association, Philadelphia. Part of it refers to local circumstances, but the following considerations deserve general attention at a time when the position of the architect in connection with the laying out of the grounds attached to his buildings is debated.

In announcing the subject for discussion this evening, I feel that I owe you an apology for using such a broad, comprehensive title. Certainly, I do not intend to inflict on you a comprehensive discussion of the subject. It is too broad, and touches too many details for me to attempt anything like a thorough treatment in one evening. "The Relation of Natural

to Artificial Beauty in Landscape" is, in fact, a subject on which volumes might be written.

And first, as to the word "landscape"—I intended to use it in its widest sense as applying to any scene, whether that scene contains any element of man's handiwork or not. At the present time the subject of "landscape gardening," "landscape design," "landscape architecture," or whatever it may be called, is receiving a great deal of attention, but in speaking of artificial interference with nature, I should like to abolish the word "landscape" and use instead the words "outdoor design," reserving "landscape" for that broader meaning which would cover every scene, whether natural, artificial, or partaking more or less of both, anything, in short, which the eye may meet under the open sky.

At this age we are in the midst of great structural and engineering undertakings to meet the practical needs of our present civilisation, with little thought as to their artistic expression. But times will change and the practical developments of applied science will some day give way to more definite efforts to make the face of the earth more beautiful. It may be a question only of a generation or two when the imagination of the multitude may cease to be moved, as it undoubtedly is to-day, by the great developments in transportation, the building of huge buildings and swift steamships, and by the constant improvements in electrical propulsion and communication. And when we shall have solved all these questions of applied science and are content with our achievements in that direction, we may turn our efforts to still greater achievements in an artistic way. To-day, those in whom the artistic sense is dominant are in the minority, and this has always been so and probably always will be. But to-day differs from past ages in this fact, that the great majority of people in this age do not really care for artistic expression, do not care as much for the beautiful as they do for what we commonly call "the practical." To-day the artist occupies a relation to the great mass of humanity almost analogous to that which the mediæval alchemist or scientist held in the day when it was the artist who counted and who captured the applause of the multitude. It is true that the support of the multitude is constantly increasing, but as yet this support has not swept everything before it, and a utilitarian and purely practical tendency is still dominant. The artist of to-day is not in need of better criticism. He has as good criticism as any age has produced, but he is in need of a greater amount of criticism and of the backing of the majority of the people, the criticism of the masses which finally, if not immediately, condemns the inartistic and upholds that which is sound and true in art.

Whatever scene our eyes may light upon, whatever landscape we may contemplate, there can be only two factors—two agencies—which determine its effect upon our minds, upon our sense of the beautiful—Nature and Man. Nature, of course, is a very wide term, but we know what we mean. It is the supreme, the eternal, ever-present factor. We cannot escape from it entirely if we would, for even man in his works is governed by nature's own laws. No one of them can he undo or abrogate. The primary laws of physics must govern everything which he builds, and the artistic expression of his building must reflect an acknowledgment of natural laws. But in distinguishing between these two agents, I mean to refer to nature as that which she does without the aid of man, what she would have done had man never lived upon the face of the earth. On the other hand, in many scenes and many things which we love to look upon, there is predominant the other agency, and our delight in its contemplation at times transcends even that which we feel in looking upon nature; the thought that this stone has been hewn and set, this building has been reared, this path has been cut, these trees have been planted by man and to satisfy man's needs and ideals. Perhaps no two of us could agree upon the intensity of pleasure derived from the contemplation of a great cathedral, on the one hand, or the majesty of a rock-ribbed mountain, or the boundless sea, upon the other, nor is it worth while that we should agree. To some of us nature appeals more than art, though I believe that to most of us each appeals with almost equal force, according to our varying moods.

It follows, then, that if we are to arrive at the true sources of artistic enjoyment, we must cultivate and love and study first of all nature, and after that man's history, man's ideals, all, in fact, that has led him to express his wants, his aspirations in physical form. This last is nothing more nor less than the study of architecture in its broadest sense. For all that man builds with an eye to use and beauty is architecture in the sense that it is governed by one system of principles and laws. From time immemorial man has built houses and temples and bridges, has hewn roads and laid out gardens and wrought whatever pleased him upon the face of the earth to satisfy his needs, material and spiritual. And from time immemorial it has pleased him, and it pleases us to-day and will always please our descendants, to follow certain methods, certain principles of dimension, direction, and propor-

tion in that which we lay out and build. These methods are no doubt deduced primarily from our innate sense of natural laws. But it is scarcely necessary to go into the source of them. Suffice it to say that it is an indisputable truth that man prefers to set stones level, to build walls straight, or, at least, symmetrically curving, to make level places on which to stand or walk, whether they be floors beneath a roof or terraces under the open sky. His sense of mastery over nature is expressed in doing things not as nature would do them. Nature upheaves and splits and tumbles down her rocks. Man hews them into blocks, and sets them level and true and rears them into walls. So it always has been—so it ever will be.

In every landscape, then, these two elements must remain distinct. We cannot absolutely unite them nor deceive ourselves into thinking that we can. We cannot modify to any extent worthy of consideration the process of natural growth, or at least such modification can be but temporary. Nature is absolutely continuous and persistent. We must then regard ourselves only as intruders—invaders. It is true that we can interfere with nature, but it is my purpose to point out that it is not as interferers that we should regard ourselves. As invaders we may, for we could not avoid the position if we would, unless indeed we return to absolute savagery.

About the middle of the century just passed, there grew up a school of landscape gardening, so-called, which was perhaps a natural reaction against the extreme and lifeless formalism into which architecture had descended. The school made a complete revolution in the principles which had always before that time governed all artificial interference with the face of nature. It did not propose to do merely what man had always been pleased to do in the way of laying out and building and planting, but instead proposed rather to imitate and follow nature on the lines which she has always reserved to herself. This school still has its disciples, and the results of its work are all about us, and have caused, to my mind, a most deplorable subversion of the laws and the principles upon which beauty in landscape must depend. Nature is entirely able to do without the aid of man, and it is equally true that it is impossible for man to imitate nature without making himself and his work more or less ridiculous. When he attempts it, he must cast to the winds all the methods, all the principles which he has developed in centuries past, and he must play at his game as a child would play at horse. But every once in a while he has to leave his play to attend to the serious matters of life, to build a house or a flight of steps, and these he has to do on the same good old lines that have always prevailed in architecture. He may build his silly little rockeries in would-be imitation of nature and cut his meaningless winding walks, but he cannot cease to build civilised buildings, he cannot be content to live in caves or rude, shapeless huts.

The moral of all this is, let nature alone, except where, to satisfy your own practical needs, to satisfy your own ideals of the beautiful, you invade her sacred domain with works that are frankly and freely designed upon lines not imitative or in competition with her, but rather on lines which have commended themselves to man as necessary, reasonable and beautiful from his own particular point of view, lines which embody all which he has ever developed as an expression of his own mastery over the earth.

Can we then intrude upon nature in anywise without destroying its charm? Decidedly we can. We may invade nature with our works and find the result all the more charming; and, in the same manner, nature may, and does, invade our works only to increase their charm. But the source and reason of our invasion must announce itself frankly. We must feel that this space through the forest has been cleared and levelled in order to meet some human need, that it reminds us of the existence of man and enforces the human element, and so serves as a foil or contrast to nature's work. To look at the other side, what can be more beautiful than the work of man overgrown by nature—the ruined abbey wrapped in ivy, or the old Italian garden, where the balustrades are half smothered in vines, and the vistas down the long paths and terraces are framed between giant cypresses, growing without restraint, long after the builders of those stately balustrades and fountains are forgotten?

Nature, in her own wildness and ruggedness and majesty, we cannot rival, and she, on her side, makes no attempt to rival us. The majesty and beauty of the lonely mountain side we cannot create, but we may invade it without destroying its charm. Nay, more, we may introduce the human element in a way only to heighten and increase that charm, and it is just where those two elements meet, each in its purity, its frankness, its directness, that we often find the very highest and keenest sense of the beautiful. Can anything be compared in beauty with the views from out the terraced gardens of the Italian lakes, across the deep, smooth surface of the water to the great mass of the Alps beyond? Is a flower ever more beautiful than where it has grown in the crevices of a mouldering ruin? And which is most desolate—the city street, devoid of one touch of natural growth, whether of leaf or flower, or the unbroken

expanse of a trackless plain? We have our moods when each of these may please us, and nature has every advantage both in majesty and beauty, but it remains that man is a social being, and, as a rule, he loves to be reminded of the existence of his fellow-man both past and present. He will never resent the evidences of that existence if they occupy a reasonable and proper place.

To come, then, to details, Where and how may we invade nature? First, we must build our houses, our cities, we must bridge our rivers and ravines, we must lay out our roads, even our railroads, and we must go even further. We must, if we are to satisfy our sense of eternal fitness, make our terraces and gardens where, while asserting our dominance, we can hand over a larger share to nature's decoration of trees and flowers. Nay, we can even take these trees and flowers and arrange them in formal lines, as we might build a wall, according to our own ideals of what man should do. Nature would never do so of her own accord. An avenue of trees planted at regular intervals, or a trimmed hedge, is as much and as confessedly artificial as the road which they skirt. The box-borders of a garden are, in a sense, as architectural as a stone balustrade. They are simply the works of man in a living medium instead of in a dead one. It is merely a question of how much we shall do of this sort of work, how much is appropriate in a given place to emphasise this mastery of man over nature. Manifestly, it must depend upon the dominance with which we wish to assert, the extent to which we wish to remind ourselves of, the human element. A planted avenue has no place in the midst of an uninhabitable plain. It belongs as part of a house, some human arrangement made for man's use and delight. But in proportion as we separate ourselves from centres of human life, should we restrain ourselves in making artificial arrangements of planting. A garden is nothing but a great outdoor room, a house, so to speak, under the open sky, in which the levels, the width of the paths, should be determined by the same principles of design as we would apply within our houses in the arrangement of our rooms, but whose decoration and colouring, so to speak, is turned over to nature. And a park made for the use of the multitudes of the city will, in the same way, find its greatest beauty in allowing man's work and nature's to follow each along its own lines. Why is an avenue of great trees more majestic than an equal number of trees equally spaced, but artificially dotted at random over a given area? The avenue in its arrangement, in its spacing, is man's way of arranging trees. It is like a peristyle of great columns, but an equal number of trees equally spaced and yet at random is neither man's way nor nature's. It expresses neither one thing nor the other, either to the lover of art or to the lover of nature. Nature does not plant her trees like a crop of corn at suitable intervals and of equal age and size, and it is only where there has been an unsympathetic and unnatural and Philistine interference on the part of man, whether in planting or in cutting down, that we find trees grouped aimlessly, but at equal intervals.

Nature does not build river-walls or bridges or roads any more than she does houses, much less does she make railroad cuts or embankments. What, then, should be our rule in dealing with these? The cuts and embankments for railroads our landscape gardeners have, fortunately, generally given up in despair. Surely if not discouraged, nature will take better care of these than man can possibly do. She will gradually shroud them in trees and thickets and hide the ugly bare dashes that the hand of the engineer has made. Nature will take care of them if she is left to herself, and as time goes on the ravages of man's hand will be lovingly hidden by moss and leaf, and there will be nothing to mar our sense of the reasonable and beautiful. But in a great city or its park or within the well-kept precincts of a country place close to the house, where man must be constantly reminded of his own existence, where people congregate, there it is appropriate that the greatest architectural perfection, the most careful study of design, should be given to every artificial work. We are so trained to think that what we build in the shape of a house must be carefully studied by men who have given their lives to the subject, whose life-work it is to design, that in this last century we have forgotten that all building, all artificial interference with the face of nature, as I said before, is a part of the same thing—is only the visible expression—the physical expression of man on the face of the earth. And the same principles of design that determine the proportions of a façade—whether an arch shall be a little higher or a little wider—those same principles govern the dimensions that we would spread out on the face of the ground. A flight of steps out under the open sky is just as much a matter of nice design and proportion as a façade of a building. We are not used to thinking so, especially here in this part of the world, but I believe we are coming to it, and everyone did think so before the beginning of the century just past. All outdoor design was considered as only a part of architecture, and the same nicety and skill applied to it as in the building of houses. The idea is not

only unfamiliar to us of the present day, but it is one I have myself found very hard to put into practice. We have all of us grown up in an atmosphere of believing that the work a man does with pick and spade is an entirely different thing from what he does with hammer and saw, but it should not have been so considered.

But let nature, so far as she will, clothe this work of ours—whether it be simple or elaborate—in her own way, and still the effect will be more and more beautiful. The two elements will stand in stronger and stronger contrast with each other, not in discord but in utter harmony and agreement. I by no means urge elaboration or over much ornament in that which we do. In this we should be governed by the same rules of good taste and restraint that should characterise every architectural work.

THE IMPERIAL INSTITUTE.

IN accordance with the Imperial Institute (Transfer) Act, 1902, the management of the Imperial Institute will be vested in the Board of Trade from January 1, 1903. In carrying out these duties under the Act the Board of Trade will be assisted by an advisory committee representing various Government departments and the Indian and Colonial Governments. The Institute will be managed by the Board of Trade through their Commercial, Labour and Statistical Department, of which Sir Alfred Bateman, K.C.M.G., is Comptroller-General.

The Board of Trade have appointed Professor Wyndham Dunstan, F.R.S. (now director of the Scientific and Technical Department of the Institute), to be director of the Imperial Institute at South Kensington. Professor Dunstan will continue in charge of the scientific investigation of economic products, and will supervise any other branches of work carried on by the Board of Trade in the building at South Kensington, including the collections of products of the Empire so far as they will be under the control of the Board.

The work carried on by the commercial intelligence offices of the Imperial Institute will be conducted by the Commercial Intelligence Branch of the Board of Trade, which, subject to the Comptroller-General, is under the direction of Mr. Thomas Worthington. The question of a City office for this branch (which is now located at 50 Parliament Street, S.W.) is receiving the attention of the Board, and, pending its establishment, verbal inquiries on commercial matters after January 1 may be addressed to the branch through the temporary inquiry office established in 49 Eastcheap, E.C., the City office of the Imperial Institute.

The above arrangements do not affect the parts of the collections and the information offices under the special charge of representatives of the India Office and of certain Colonial Governments.

CONSTRUCTION OF NEW ROADS.

A LETTER has been written by the Hon. Secretary of the Roads Improvement Association, in which he says:—Is it possible, without unnecessary or disproportionate expense, to adapt existing roads for modern vehicles and to build such new ones as are necessary? This is the real motor problem. The attempt to formulate workable regulations under which motor-cars, bicycles, traction engines and electric trams shall be accommodated satisfactorily upon roads grossly inadequate even for horse-drawn and pedestrian traffic, is one which in the circumstances of the case is bound to fail. It is impossible to get a quart into a pint pot.

Unfortunately, under existing conditions, it is as practicable to talk of uniting the earth with the moon as to propose to open up some of the country districts within twelve miles of the Bank of England by a new arterial thoroughfare. No new main roads have been constructed out of London for many generations. In the suburbs many hundreds of miles of mean streets have been built, but they take no share of the through traffic, and serve only to feed the previously existing main roads. Under our present system of highway administration trunk road construction is impossible.

This statement may seem extravagant. It is not so. If anyone doubt, let him formulate a definite scheme for building a new road ten or twenty miles long through country divided up for administrative purposes among eight or nine highway authorities, and then consider the obstacles to its realisation. He will find that they are insuperable. Such a scheme gained some publicity a few months ago under the title of "A Royal Road to Windsor." It was proposed to construct from a point on the Goldhawk Road—three-quarters of a mile distant from the terminus of the "Tube"—a direct road out of London between the Oxford Road on the north and the Bath Road on the south. The new road running due west would strike the Bath Road again at Slough. The extension from Slough to Windsor, although it gave the proposal its name, is not

material to it. It was pointed out that this scheme would (1) shorten the distance to Reading and the West of England, (2) relieve the congestion of traffic on the Bath Road on the one hand and the Oxford Road on the other, and (3) open up a new district over which London's population could spread itself, and in this way contribute to the solution of the housing problem. It was suggested that the road should contain separate tracks for (1) motor cars and bicycles, (2) electric trams, and (3) horse-drawn vehicles.

The urgent necessity for relieving the traffic through Brentford on the one side and Acton on the other by building a new road has been admitted by everybody. If space permitted I would show why (1) the Middlesex County Council, (2) the London County Council, (3) the local highway authorities, (4) the State, and (5) private capitalists cannot separately or in co-operation construct it.

At the present time all the direct main roads into Kent pass through New Cross. There is urgent need for a new trunk road into Kent. The saving in time and power which would result it is difficult to exaggerate. But however economically necessary it may be to relieve the pressure of the traffic on the main roads in the south-east of London and develop the adjacent rural districts for housing purposes, it is impossible to do so. Still more visionary is it to talk of constructing a properly engineered road between London and Dover, and so giving good road communication between London and an important commercial and military port. It may be possible to secure an electric railway between London and Dover, but no machinery exists for constructing a new road between the two places.

The difficulty is not confined to the Metropolis. Let anyone propose to connect two rapidly growing county boroughs, twenty or thirty miles distant from one another, by means of a new trunk road, and he will find the scheme, however desirable, quite impracticable. Let him propose to develop the suburbs of one of those boroughs by a carefully-thought-out scheme of radiating thoroughfares, he will find that equally impossible.

No public authorities have been constituted adequate to and equipped for the work of building new main lines of road communication. No machinery exists by which private enterprise can undertake the task. We are paralysed. Road-building energy is held in bond. Hence a motor problem; hence a housing problem; hence the growing difficulty and increasing cost of transporting goods by road, the vexatious delays, the innumerable street accidents.

How can these difficulties be overcome? How can the mistakes of the past be rectified? How, in short, can we, without any revolutionary legislative or administrative changes, secure the construction of the new trunk roads at a cost which will be proportionate to the results obtained and by methods which will not interfere unduly with existing interests?

TESSERÆ.

The Church of Aracœli.

ONE basilica of Rome, founded in A.D. 900, and therefore appertaining more to the tenth than the ninth century, is that of S. Maria-in-Aracœli. There still remain of this epoch the three vast naves, divided by columns bearing semi-circular arcades. Stems and capitals show the most grotesque confusion of picked-up marbles. Some of rough Ionic form hint at the time in which the church was built. Fragments of fasces and parapets of Italian Byzantine style may be seen in the interior of the ambo on the right side, and present the usual spirals, or else little arches holding crosses, roses, &c. Three interesting stems of columns, of unequal dimensions, that must have belonged to ancient ciboria, were discovered during the demolition of the old convent of Aracœli. They are striped one-third up vertically by large channellings filled up by cabling, and the other two-thirds are striped spirally by Doric channellings. That these elegant stems should be attributed to the Italian-Byzantine style is confirmed by other ciboria of Ravenna authentically of the ninth century, which are similarly adorned. Nothing Byzantine is revealed in them; they are absolutely Roman in character, for, strange circumstance, while the pagan Greeks never omitted to channel their columns (no matter of what dimensions they might be), the Christian Greeks, on the contrary, kept them invariably smooth, in order to enjoy all the beauty of veined or many hued marble. On the other hand, the Romans cared but little to channel columns of rough stone, but took much pains to channel those of white marble, in order to moderate their dazzling whiteness with reposeful shadow. At the end of the Empire the Roman architects of the decadence sought after bizarre channellings, which they often preferred gyrate or cut into various lengths, or fashioned into batons and gules rather than shell patterns. One would say that the stems of these Italian-Byzantine ciboria were copied from some Roman model of the third or fourth century.

Texture on Sculpture.

From the great numerical superiority of painters it results that their voice far outweighs, in public estimation, the judgment of the few whose special calling should render them the highest authorities in their own art, and, whilst the opinions of sculptors or architects would not be considered of weight in any question of painting, the public are content to accept the dictum of painters on all subjects connected with sculpture or architecture, whilst the voices of those who know most of these arts are drowned in the universal clamour, and their claims are selfishly ignored, even in the high council chambers of art. Seeing, then, that the entire control of art matters is in the hand of painters, can we wonder if we find sculptors who endeavour to propitiate them by cultivating those qualities the average painter is most capable of appreciating, even though these may be such as by their undue development lead to the degradation and destruction of the art? The texture of the skin can be rendered in sculpture by means which are neither very laborious nor very difficult; and where we have an opaque material as metal, clay or plaster, there is no doubt that this is a real gain, for the texture gives a softness and fleshiness which, though it has nothing whatever to do either with good or bad modelling, is not to be obtained by any other means. When, however, a work is executed in marble softness is chiefly the result of the material, the crystalline structure of which, combined with its translucency, breaks up the light in much the same manner as do the pores and other regularities of the human skin, so that there is no absolute need for imitation of skin texture in marble. In works of considerable size some further breaking up of the surface may occasionally be resorted to with advantage.

Belgian Carillons.

In Belgium day and night are set to music—music on a scale more colossal than that of the largest orchestra ever yet heard; music more penetrating than the loudest trumpet or organ blast. For however large the chorus and orchestra, it would scarcely be possible in the east end of London to hear a concert at Westminster, yet on still nights with a gentle wind blowing at that distance Big Ben has been distinctly heard. In Belgium every seven minutes there is bell-music, not only for the whole town, but for the country miles round. Those carillons, playing the same cheerful air every hour throughout the year, at last acquire a strange fascination over one who lives within sight and hearing of some such grey old church as St. Rombaud at Mechlin. There is no greater mistake than to suppose that bell-music every seven minutes is an unpleasant disturbance or interruption; its very frequency enables it to become completely assimilated to our everyday life. Are we not surrounded by natural changes and effects quite as marked in their way as bell-music, and yet which have no tendency to unsettle, distract or weary us? How loud at times does the wind blow; how suddenly on a dark day will the sun burst into our room; how shrill is the voice of our canary, which at last we hardly heed at all; how often does a rumbling vehicle pass along in the streets, and yet we cease neither reading nor writing for any of these. The bells musically arranged never irritate or annoy one in Belgium. Instead of time floating by in blank and melancholy silence, or being marked by harsh and brazen clashes, time floats on there upon the pulses of sweet and solemn music. To Belgium belongs the honour of having first understood and felt bells as musical notes, and devised that serial and colossal musical instrument known as the carillon. In the sixteenth century the use of several bells in connection with town clocks was common enough. Even little tunes were played at the quarters and half-hours. The addition of a second octave was clearly only a matter of time. In the seventeenth century carillons were found in all the principal towns of Belgium; and between the seventeenth and eighteenth centuries all the finest carillons now in use, including those of Malines, Antwerp, Bruges, Ghent and Louvain were set up. There seems to have been no limit to the number of bells, except the space and strength of the belfry. Antwerp Cathedral has sixty-five bells; St. Rombaud, Mechlin, forty-four bells; Bruges, forty bells and one bourdon, or heavy bass bell; Ghent, thirty-nine; Tournay, forty; Ste Gertrude, at Louvain, forty. The great passion and genius for bells which called these noble carillons into existence can no longer be said to be at its height. All bell machinery can be infinitely better made now than ever; but notwithstanding the love of the Belgians for their chimes and carillons, and the many modern improvements that have been recently made, we cannot help feeling that the great bell period ended in 1785 with the death of the greatest organist and carillonneur Belgium has ever produced, Matthias Van den Gheyn.

Greek Architecture and Greek Tragedy.

The simplicity of the architecture of the Greeks, with the gradual improvement of whose rational faculties, truth and nature, in all the departments of knowledge which they could

reach, continued to extend their sway, may be compared to that of their tragic drama. The same state of civilisation produced the two, the same people admired them; and they were both under the regulation of simple but strict rules, grounded upon an accurate investigation of the objects around them. As the merits of the one consisted mainly in the development of the ordinary affections of the soul, under the greatest possible excitement, in the course of some important and well-known action, it required no intricacy of plot, no refined sentiments, no variety of action, no fluctuating play of the passions, no strange inventions, no surprise in unravelling a new story; but the language in which it was composed was pure, beautiful, correct and luminous throughout; the dialogue, ever true to nature, presented the precepts of philosophy harmonised by the Attic muse, and the choruses depicted the common feelings of all who heard them, as men and patriots, in strains accompanied with exquisite melody, producing the most exalted emotions. In the same manner their manly Doric architecture, which was truly "nature methodised," the only architecture, says Addison, which reconciles grandeur with regularity and proportion, admitted no meretricious display of ornament to break the unity of the design. Every part of it spoke to the eye at once, and was intelligible to all; nothing useless, nothing out of its place. Thus the Parthenon became the very school of architecture and sculpture combined, where each gave additional lustre to the other, and augmented its magical effect; and, if the sacred buildings of Asia presented something more gorgeous, more decorated than those of Athens and Proper Greece, these alone were regarded as the best models, and were the tests by which others were judged, as Cicero purified his luxuriant diction by the study of the Greek writers of a better time, in the Lyceum and in the Academy; and he thus introduced into his native language a sweetness, a grace and a majesty hitherto unknown to the Romans.

GENERAL.

The Winter Exhibition of the Royal Academy will open on Monday next.

Mr. H. Percy Adams has been appointed by the advisory committee as architect of the King's sanatorium.

The Election to the Disney professorship of archaeology will take place on Tuesday, January 20, 1903. The professorship is tenable for five years. Mr. Ridgeway, whose term of office expires on January 15, offers himself for re-election.

The West Front of Exeter Cathedral, which has been gradually forced outward by the weight of the roof, has been found insecure, and the Dean and Chapter have decided on a renovation.

An Election will take place at the Royal Academy on the 21st inst. There are vacancies for one Royal Academician and three Associates.

Messrs Hudson & Kearns are again to the fore with their most useful diaries, calendars, date-indicating blotting pads and other accessories for the offices of architects and builders. All varieties of their productions are especially suited for their purposes. The papers used are among the best which can be procured, and there is a solidity about the binding which makes the volumes enduring as befits books of reference. From their extensive *clientèle*, Messrs. Hudson & Kearns have opportunities for discovering all that is needed in offices. They have laid themselves out to merit approval and have succeeded.

A Bill is to be introduced in the United States House of Representatives providing for placing on the free list of the Dingley Tariff "paintings in oil or water-colour, statuary, sculpture, drawings, engravings and etchings," which "shall have been manufactured or produced more than fifty years before the date of importation."

M. Henri François, pupil of M. Moyaux, has won the prize founded at the Ecole des Beaux-Arts by American architects. The subject was "A Hotel in California," of which the façades had to be of timber.

The Designs for a reredos to be erected in All Saints Church, Maidstone, as the gift of Mr. Herbert Monckton, who is town clerk of Maidstone, have been adopted. The design is elaborate, and will complete the work of restoration.

The Rev. H. Rickard, M.A., principal of Chichester Theological College, has commenced a series of lectures on the subject of "The Great Churches of the North of France," the first of the series being delivered on Monday. The lectures are illustrated with photographs, diagrams and original drawings.

The Greek Government, acting with the foreign schools of archaeology at Athens, has decided to invite to a first international congress of archaeology all the leading archaeologists of the world.

Mr. A. W. S. Crosse will read a paper on "Competition" at the meeting of the Manchester Society of Architects on next Thursday.

The Commission of American Engineers recently appointed to investigate the problems of water waste prevention and additional water supply for the city of New York have entered upon their duties. The commission is expected to make its final report by November 1903, and to defray its expenses an appropriation of 100,000 dols. has been made, of which 36,000 dols. is for salaries of the commission. The Department of Water Supply, Gas and Electricity will co-operate in the studies.

Mr. H. F. Hibbert, chairman of the technical instruction committee of the Lancashire County Council, was admitted to the freedom and livery of the Plumbers' Company at the quarterly meeting held at the Guildhall.

The Housing Committee of the Liverpool Corporation have agreed to recommend that the Council place at the disposal of the committee the sum of 5,300*l.* for the purchase and demolition of insanitary property under the powers of the Liverpool Sanitary Amendment Act, 1864, and the various statutes and provisional orders amending that Act, and also 55,000*l.* for the purchase of land and erection of dwellings.

Hughenden Manor, where the late Lord Beaconsfield lived, is to be let. The house occupies a conspicuous position on the Chiltern Hills, close to High Wycombe, and has of late been undergoing extensive improvements. The estate over which the sporting rights extend covers about 1,300 acres.

The Trustees of the American Academy in Rome have taken steps towards securing an endowment fund of one million dollars, sufficient to place their Academy on a par with that of the French Academy in Rome and those of other countries.

The American Institute of Architects have elected the following corresponding members:—John James Burnet, of Glasgow; Bannister F. Fletcher, of London; Mervin MacCartney, of London; Leonard Stokes, of London; A. H. Blomfield, of London.

The Halesowen District Council has received official sanction to borrow 95,000*l.* to construct a light railway between Stourbridge and Birmingham. The railway, it is expected, will be completed within three years.

Dr. A. S. Murray, of the British Museum, has been elected a corresponding member of the Institute of France (*Académie des Inscriptions et Belles-Lettres*).

The Metropolitan Wesleyan Chapel Building Fund has sanctioned some twenty-six fresh sites for Wesleyan chapels in or near London—at Highgate, Harrow, Upper Tooting, Balham, East Ham, Acton, Hanwell, Finchley, South Wimbledon, Edmonton, Plumstead, and other populous centres. The report states that twenty other localities where Wesleyan chapels are needed are under consideration.

The Correspondent of the *New York Times* telegraphs from Mexico City that Sir Weetman Pearson & Son, the English contractors, have procured a concession to establish an electric generator, at a cost of 12,000,000 dols., in the mountains of Puebla, where there is abundant water power, to transmit a current of 80,000 horse-power to the city for commercial uses.

The St. Honoré market, erected on the site of the Jacobin monastery in Paris, is to be converted into a model laundry. The monastery was founded in 1613, and after being suppressed in 1793 served as the meeting place of the Jacobin Club, of which Robespierre was the head. The market was commenced in 1809 according to the plans of M. Molinos.

The Incorporated Gas Institute and the Incorporated Institution of Gas Engineers have been dissolved for the purpose of forming a united society under the name of the Institution of Gas Engineers. The necessary arrangements have been completed, and the Institution has been duly registered, the offices being at 39 Victoria Street, Westminster.

His Majesty the Emperor of Germany, accompanied by the Empress, visited the atelier of the sculptor Professor Eberlein in order to inspect the statue of Goethe which is destined to be erected in Rome in 1904.

Portsmouth Dockyard is to be equipped with a new steam factory. The building will cost nearly 200,000*l.*, and all the engineering work of the yard will be centred in it, the present factories being devoted to other purposes. This step has been made necessary by the growth of work at Portsmouth.

Mr. Carnegie has intimated to the Provost of Greenock that he is prepared to present to a properly authorised authority in the town the sum of 10,000*l.* to defray the cost of the erection of a memorial to James Watt; or he is willing to head a movement in America to raise a large fund which, added to what might be raised in Great Britain, would provide a wider scheme.

A Special General Meeting of the Liverpool Architectural Society will be held at 13 Harrington Street, Liverpool, on Monday next, January 5, when a paper will be read by Mr. C. Harrison Townsend, F.R.I.B.A., on "Mosaic Work."

Mr. G. F. Watts, R.A., has been elected a foreign corresponding member of the *Académie des Beaux-Arts*.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

KINGSTON-ON-THAMES.—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and

10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

ST. IVES, CORNWALL.—Jan. 31.—Competitive plans are invited for the erection of municipal buildings, to consist of a guildhall, council-chamber, jury room, public hall, town clerk's office, surveyor's office, treasurer's office, muniment room, parochial office, mayor's parlour and fire-brigade station and offices. Premiums of 70*l.* and 30*l.* respectively will be awarded to the architects whose plans and specifications are considered to be first and second in order of merit. Mr. Edward Boase, town clerk, Town Clerk's Office, St. Ives, Cornwall.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C.E., borough surveyor, Council House, Sutton Coldfield.

CONTRACTS OPEN.

ACTON.—Jan. 6.—For erection of a park-keeper's lodge in Acton Park, the erection of a house at the sewage works, and for supplying and fixing iron railings for enclosure in Acton Park. Mr. D. J. Ebbetts, surveyor, 242 High Street, Acton.

BARNSELY.—Jan. 7.—For erection of five sand-washers and making and delivery of a small quantity of straight cast-iron socket pipes, of from 5 inches to 18 inches internal diameter, together with certain special pipes, in connection with the Midhope Waterworks filter beds in course of construction near Upper Midhope. Messrs. T. & C. Hawksley, 30 Great George Street, Westminster, S.W.

BATLEY.—For erection of new central stores, for the Batley Co-operative Society, Ltd. Mr. Harry B. Buckley, architect, 85 Commercial Street, Batley.

BETHNAL GREEN.—Jan. 5.—For erection of dormitories, maternity wards and other buildings at the Waterloo Road workhouse, Bishop's Road, Victoria Park. Mr. W. A. Finch, architect, 76 Finsbury Pavement, E.C.

BOLSOVER.—Jan. 7.—For supply of steam road-roller weighing 10 tons or 12 tons (separate). Mr. John Hunter, clerk to the Urban District Council, Bolsover, Chesterfield.

BOSCOMOOR.—Jan. 6.—For the repair of two brick bridges at Boscomoor, near Penkridge, Staffs. Mr. H. M. Whitehead, surveyor, Mill Street, Penkridge.

BOW.—Jan. 20.—For the reconstruction and widening of Bow Bridge, carrying Bow Road over the River Lee, and situate partly in the County of London, and partly in the County of Essex. Particulars at the Engineer's department, L.C.C. County Hall, Spring Gardens, S.W.

BRIDGWATER.—Jan. 6.—For erection of boundary wall, gate piers, shed and other works in connection with the Blake Gardens. Mr. W. T. Baker, town clerk, Bridgewater.

BRISTOL.—Jan. 6.—For supply of surface condensers, &c., for the second instalment of the Avonbank Electricity Works. Mr. H. Faraday Proctor, city electrical engineer, Temple Back.

BURY.—For erection of a branch bank, with two shops and clubhouse, in Silver Street, Bury, Lancs. Messrs. Moulds & Porritt, architects, Victoria Buildings, Bury.

BUTTERSHAW.—Jan. 5.—For masonwork (labour only) in erecting four houses, Buttershaw, Yorks. Messrs. Brayshaw & Dixon, architects, Bowling Old Lane, Bradford.

CAMBORNE.—Jan. 22.—For erection of Council offices and fire station at the Camborne Cross, Camborne, Cornwall. Mr. Sampson Hill, architect, Redruth.

ST. THOMAS'S CHURCH, Lochee Road, Dundee, which has been erected in connection with the Church of Scotland through the instrumentality of the Dundee Church Extension Association, was opened for public worship on the 29th ult. The new church, the foundation-stone of which was laid on May 17, 1902, has cost about 4,800l.

THE Baptist churches of Lancashire have expended during this year the sum of 9,974l. for new places of worship, 3,820l. for church improvements, new schoolrooms, &c., and 12,838l. for the liquidation of their chapel debts. The Cheshire Baptist churches reduced their debts by 987l., and expended 286l. in the improvement of existing buildings.

CABOT'S INSULATING & DEAFENING QUILT.

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay, moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

USERS' OPINIONS RESPECTING URALITE.

Messrs. COLLS & SONS write:—

Colls & Sons.

Telephone 103 Bank.

5 COLEMAN STREET,

LONDON, E.C.,

July 31, 1902.

DEAR SIRS,—

We are glad to be able to state that, after extensively using Uralite, we find it very useful in many ways.

For covering partitions and ceilings in lieu of plaster the advantage of quick application and the absence of wet and dirt, as with plastering, make Uralite most valuable, apart from its fire-resisting properties, which, of course, form the most important argument for its use, as it satisfies the requirements of insurance and other Surveyors.

In constructing Fireproof Screens or Theatre Curtains, in the erection of Bungalows, Pavilions, &c., or in forming Fire-resisting doors, Uralite has many uses, and all the work we have carried out where it has been introduced has been most satisfactory, and answers the purpose for which it was intended.

In Joinery Work, where wide panels are required, in which it is difficult to prevent shrinkage, Uralite may be used for these panels with great advantage, as it can neither shrink nor swell.

Yours faithfully, (Signed) COLLS & SONS.

South Street, Ponders End.

DEAR SIRS,—

We submitted the samples of Uralite supplied by your Mr. Armstrong to some severe tests, and the materials came triumphantly out of the ordeal.

We are now lining out an engine-house with Uralite to make it fireproof, and we shall presently use it for other purposes in connection with extensions at these Works.

For foundry roofs exposed to acid fumes we consider it to be the finest material in the world.

Yours faithfully,

THE UNITED FLEXIBLE METALLIC TUBING CO., LTD.

Per W. BERRYMAN.

BUILDING TRADES EXHIBITION.

IT will be observed from one of the advertisements in this number that an International Building Trades Exhibition will be held in the Royal Agricultural Hall, Islington, from June 13 to June 20. The time selected is a little later than usual. That is one benefit for the exhibitors, for there is a larger number of people from the provinces in London during the summer than in the spring. Londoners are also more attracted to an exhibition when days are long. The exigencies of trade are fast removing our insulation, and in order to be in keeping with the times the exhibition is announced to be "international." In all contests of the kind England has been able to hold her own, and we have no doubt that in June the old supporters of the exhibition will not have much apprehension about foreign rivalry.

Special exhibitions like those of the building trades have many advantages over what are known as Great or Universal Exhibitions. In the first place, those who take part in them have not to expend an enormous sum of money. Probably not one in a thousand of the people who sent goods to the last Paris Exhibition were able by sales to recoup their expenses. There are, too, so many counter attractions, few visitors care to search for objects relating to construction. An attempt may be made occasionally, but the goal is rarely reached, owing to the allurements on the way. In special exhibitions, on the

contrary, visitors have a definite purpose before them, and they can hardly avoid coming in contact with the productions which are deserving of their attention. The preceding exhibitions, under Mr. Greville Montgomery's skilful management have brought such profit to all who have participated in them, there can be no doubt that the coming exhibition will attain equal, if not more advantageous results.

Two years ago the experiment was tried of introducing architectural drawings. Without them the exhibitions, however excellent, were incomplete. Style in all the manufactures allied to building is determined by architects, and there should always be the closest relationship between the numerous products of all trades and the kind of buildings which are most in favour. It was with that object the aid of *The Architect* was given. Although there was an international exhibition opening at the same time in Glasgow, a valuable collection of drawings was found at Islington. This year a far larger amount of space will be available, and the drawings will be exhibited under conditions corresponding with their importance. It is therefore to be hoped there will be a thorough representation of all varieties of design. What is desirable is to have such an assemblage of drawings as would enable one of the foreign visitors to realise the position of architecture at the present time, besides helping the crowds of possible clients who on such occasions visit the galleries at Islington to obtain ideas of the kinds of buildings which would be adapted to their purpose. It cannot be said that any rivalry is contemplated with other displays. Everyone knows the Architectural Room in the Royal Academy is shunned by visitors, and all attempts to increase the attractions by means of pictorial work or models have failed. There is no other opportunity to enable the public to comprehend the condition of architecture. At Islington the old architectural exhibitions can be revived under conditions which are conducive to success.

THE plans for the municipal buildings and public library for Dingwall (Ross) were passed at a Dean of Guild Court. Dr Andrew Carnegie offered 2,000*l* for the erection of a public library, provided the Free Libraries' Act was adopted. It was resolved to comply with these conditions some time ago. An additional sum of between 2,000*l*. and 3,000*l*. will be required for the reconstruction of the municipal buildings.

NEW CATALOGUES.

MESSRS. C. & A. MUSKER & CO., LTD, of Liverpool, have prepared an extremely attractive album of illustrations of their extensive works and of the wide range of hydraulic dock machinery, coal tips, capstans, presses, cranes, lifts, pumps, &c, and electric dynamos, motors, power and lighting plants, capstans, lifts, pumps, mining machinery, &c., manufactured by them. The quality and variety of the machinery produced by this firm is so widely known that reference to them is unnecessary; we must, however, commend the careful and even luxurious style in which the book is produced, its illustrations being in the best style of collotype, and the cover attractive and artistic in design.

WE have received from the Limmer Asphalte Company, Limited, of 2 Moorgate Street, E.C., a carefully arranged little pamphlet containing a list of some of the principal works carried out by the Company. To give any idea of the places where the Limmer asphalte has been used would be impossible in a limited amount of space, but over 2½ million square feet superficial have been laid by the Company on the roofs of various public and private premises, from several of the palaces down to private residences and cricket pavilions. The Company will forward on application by any of our readers a copy of this pamphlet.

AT a time when so much attention is being given to educational matters, the catalogue of the North of England School Furnishing Co., Ltd., will be found an interesting volume, containing as it does a vast amount of information with regard to scholars' desks and Darlington slateboards (which the Company state they guarantee for ten years) in all varieties to suit colleges and schools, as well as numerous illustrations of fittings required in connection with secondary education as carried out in technical colleges and science and art schools. The Company, who are the sole makers of the Wilks Patent Climax Sliding Partition, have also had very considerable experience in the complete fitting of public libraries, many large contracts having been recently executed by them, including the Gladstone Memorial Library, Hawarden, Hull Central Library, Sunderland, and Norwich Technical Colleges, &c., and they are also contractors to H.M. Government, London, Birmingham, and other School Boards. The head offices of the Company are at Darlington, with branches at Newcastle, Sunderland, Middlesbrough and Norwich.

OUTRAM & CO. WOODVILLE, near Burton-on-Trent.

Excelsior and Rawdon Potteries,

TRADE NOTES.

AN important amalgamation in the tube business takes place as from January 1. The well-known firms of Lloyd & Lloyd, Ltd., and A & J. Stewart & Menzies, Ltd., have amalgamated, and in future the business will be carried on under the title of Stewarts & Lloyds, Ltd.

On the 20th ult., His Royal Highness the Prince of Wales, accompanied by Prince Edward and Prince Albert, formally set in motion a large chiming clock which has been erected in the parish church, Dersingham, near Sandringham, in commemoration of the coronation of His Majesty King Edward VII. The clock and chimes were made by Messrs. John Smith & Sons, Midland Clock Works, Derby, to the general designs of Lord Grimthorpe.

MR VINCENT ROBERTS, heating engineer, of Cherry Row, Leeds, has just completed the heating of the following places of worship on the low-pressure hot-water system:—Roundhay Congregational church, Bethel chapel and St. Gabriel's Church, all in Leeds; also St. Mary's Church, Selby, and the Wesleyan schools, Castleford; and by the same system, the factories of Messrs. J. Holmes & Co., Leeds, and Messrs. Redman Bros., Ltd., Ardsley. Installations of steam-heating have also been carried out by him for the Hunslet Engine Co., Ltd., Leeds, and Messrs. J. & H. McLaren, Midland Engine Works, Leeds; while other important contracts for factories, &c., are in hand.

MESSRS. SAMUEL ELLIOTT & SONS, LTD. (late of Newbury), manufacturers of high-class joinery, mouldings, panelings, &c., have opened extensive new works at Caversham, Reading. The premises consist of offices, well arranged workshops, lighted throughout by electricity, large convenient sheds for the storage of timber, the whole covering an area of about six acres, and most advantageously situated on the bank of the Thames within a short distance of the Great Western, South-Eastern and South-Western railway stations, which will greatly facilitate the despatch of goods to their customers. The buildings are substantially brick built and arranged in the most convenient form for the rapid manufacture of high-class joinery, mouldings, turnery and all kinds of woodwork. The plant and machinery are of the best, and include, we understand, all the latest mechanical improvements in every department.

CALENDARS.

AMONGST numerous calendars we have received, mention should be made of that issued by the Rugby Cement Co. with views of their works. It has brass-bound ends, and is a great improvement on the usual large calendar. From the Sun Fire Office comes a very tastefully arranged calendar, and also a useful blotter containing calendar and postal information; and one from Messrs. Douglas Young & Co., from whom we have besides a list of their sale days arranged for 1903. Messrs. Kaye & Co., of Rugby, are sending out a calendar; as are also Messrs. Spottiswoode & Co., the Ocean Accident and Guarantee Corporation, and Messrs. Hartley & Sugden, of Halifax.

SOMETHING quite out of the ordinary way is the handsome volume which is being sent out by Messrs. Morwood, Sons & Co., Ltd., of Harleston Iron Works, Sheffield. This really compendious book contains a calendar, a capital diary giving three days to the large folio page, the pages being interleaved with blotting-paper, a considerable amount of postal and other information of a useful description, and a fully illustrated and priced catalogue of the high-class stoves, ranges, boilers, &c., manufactured by Messrs. Morwood & Sons.

ELECTRIC NOTES.

THE Barnstaple Council has provisionally acquired the Town Mills site for electricity works.

THE Margam Urban District Council are considering an electric supply scheme for the district, estimated to cost 15,000*l.*

THE Leeds lighting committee are considering proposals for the electric lighting of the tramway routes within a mile radius of the centre of the city.

THE Huddersfield Corporation are about to apply to the Board of Trade for a provisional electric-lighting order for Linthwaite.

THE Colwyn Bay Urban District Council will apply to the Local Government Board for permission to borrow 2,680*l.* for electricity works extension.

A LOCAL Government Board inquiry has been held at Croydon relative to the Town Council's application to borrow 46,605*l.* for the extension of the electric lighting.

IMPORTERS—

VIGERS BROS., Timber Merchants,

Head Office:—67 & 68 KING WILLIAM STREET, E.C.
Telephone, 601 and 602 Avenue

THE Egremont (Cumberland) Urban District Council have had a Local Government Board inquiry on their application to borrow 52,353*l.* for electric lighting and traction.

THE Local Government Board is considering the Londonderry Council's application to borrow 35,000*l.* for a provisional electric-lighting order.

THE Southampton Town Council has obtained leave to borrow 3,092*l.* for electric-light mains extensions, and 4,315*l.* for a generating station.

MR. G. R. PURS has submitted a scheme for electric-lighting of Bucknall to the Stoke-on-Trent Rural District Council, utilising the sewerage works for steam-generators, at an estimated cost of 1,750*l.*

THE Lords of the Admiralty contemplate making extensive use of electricity in Chatham Dockyard. A scheme is under consideration for introducing an installation both for the purpose of lighting the workshops and for driving all the lighter machinery. It is believed that the change will be the means of effecting considerable economy.

WHAT will happen next? It is now reported that a Chicago inventor (Mr. Alfred Whitney) has organised a company to obtain electricity from 150 miles above the earth. According to the *Mail's* correspondent, Mr. Whitney asserts that the atmosphere extends seventeen miles, and that above this is an ethereal region charged with pure electricity, which he proposes to tap by means of a cable. Seventeen miles up, Mr. Whitney says, the power of gravity will be lost and the cable will simply fall into space. Any number of miles could therefore be easily unwound, and 150 miles up he expects to get electricity equalling 140,000 horse-power. Another inventor, an Italian this time, an engineer named Pansa, of Cassino, has, it is said, succeeded in producing a machine which converts the light and heat of the sun into an alternating electric current, and that every family will ere long be able to manufacture its own electricity in its own backyard for heating, lighting and driving small motors for domestic use.

AMONGST the numerous private bills that were lodged in the House of Lords on the 17th ult., is one entitled the Belfast Electrical Power Scheme. The object of the promoters of this undertaking is to obtain Parliamentary power for the "construction of electrical generating stations for the production, transformation and distribution of electrical energy over the manufacturing counties of Antrim, Down and Armagh." The Bill provides for the acquisition of a considerable area of land

on the banks of the Belfast ship channel, and also on the Newry Canal at Newry, on the river Bann at Portadown and at Ballymena. It is intended that the electrical power to be generated at these several stations will be distributed over the three Ulster counties, where it can be used for manufacturing, traction and lighting purposes. We understand that it is also contemplated to electrify the inland canal extending from Newry to Portadown, and also the navigation of the river Lagan. The Bill provides for the electrifying of existing tramways and railways.

BUILDING AND BUILDERS.

THE Walsall School Board have decided on the recommendation of the building committee to forward plans for the erection of a new school and cookery kitchen at the Pleck for the approval of the Education Department.

THE housing of the working classes committee having submitted to the Chester Town Council a scheme for the erection of twelve cottages in Tower Field Gardens, at an estimated cost of 2,160*l.*, the scheme was adopted.

THE Edinburgh Town Council plans and works committee has resolved to recommend the Council to erect a passenger lift from the basement floor of the north-west wing of the City Chambers in Cockburn Street. The probable cost is 1,000*l.*

A GREAT improvement scheme at Waltham Street Wesleyan church, Hull, has been made possible by the opening of a new street by the municipal authorities. In addition to a new entrance, it is proposed to build a new lecture hall, church parlour and suite of vestries, the whole cost being 5,300*l.*

THE trustees of St. Catherine's schools, Barton-on-Irwell, have secured a plot of land in Edison Road, where it is proposed to erect new schools at a cost of about 13,000*l.* The site has cost over 4,000*l.*, and the fittings and furniture will take another 1,000*l.*, so that nearly 20,000*l.* will be spent upon the new buildings.

THE Board of Education having approved a loan of 815*l.* for the purchase of a site for a new school in Broomhill Lane, Mansfield, the sites and building committee recommend that the Broomhill Lane infants' school be first erected for 350 children, and that it be arranged in such a manner as to permit of a mixed school being built hereafter.

C. B. KENT & SONS

BEST BRITISH BRUSHES

VARIETIES.

THE architects for the enlargement of Chelsea workhouse are Messrs. Lansdale & Harrison, of 65 and 66 Leadenhall Street, London.

THE alterations and addition to the Waterloo Road workhouse, Victoria Park, E., are being carried out from the designs of Mr. Finch, of 76 Finsbury Pavement, London.

THE cost of the new schools which are being erected for the West Ham School Board is 23,923½. Mr. William Jacques, of 2 Fen Court, London, is the architect.

A NEW infants' day and Sunday school has been opened at Marshall's Cross, in the parish of Sutton, St. Helens. The school will accommodate 112 children, and has been built at a cost of 900£.

MR. LOVELL, of 46 Queen Victoria Street, London, is the architect for the new Mission Institute erected in Brisbane Street, Camberwell. Mr. Lovell has several other buildings in hand in the same diocese.

A MEETING of the Council of the Institution of Civil Engineers of Ireland was held recently at the Institution Hall, 35 Dawson Street, at which the following members were present:—Mr. J. H. Ryan, president (in the chair); past-presidents B. B. Stoney, J. P. Griffith, E. Glover; R. Cochrane, vice-president; J. H. Moore, Fred. J. Dick, Geo. M. Ross, P. A. H. Shaw, and Marmaduke Backhouse, hon. secretary. The Council unanimously elected His Excellency the Earl of Dudley, Lord Lieutenant of Ireland, as an honorary member of the Institution of Civil Engineers of Ireland.

ARCHÆOLOGICAL research in Asia Minor continues to make good progress, and appears likely to acquire fresh impetus in the near future. The Sultan, it is said, at the personal request of the German Emperor, has presented a new site there to Germany for the purpose of such research. Already the German scientists are working with characteristic method and vigour in opening up that portion of the site of ancient Babylon allotted to them. The Americans are also busy at Nippur, and it is said that the resumption of the British excavations on the site of Nineveh is to be looked for at an early date.

THE abbey church at Bourne, Lincs, was reopened on the 22nd ult., after the completion of a further portion of the restoration work. Within the last ten years the whole of the abbey church has been practically restored, the work having

been carried out in sections, and the last section has just been completed. This last work has consisted of a new roof on the south aisle, the complete restoration of the south porch, and the doorway to the old vestry room has been replaced with a new window, as it was when the church was originally built. The work has been carried out by Messrs. Roberts Brothers, of Stamford, at a cost of 500£, under the direction of Mr. J. C. Traylen, A.R.I.B.A., of Stamford. The restoration work in the period referred to has cost more than 2,000£. The only portion that now requires structural attention is the plinth round the tower, which on the west and south sides is considerably broken and perished, and this will be put in hand as soon as funds are forthcoming. But other works remain to be done for the improvement and beautifying of the interior.

HEATING AND VENTILATION.

MESSRS. EDWIN OLDROYD & CO., LTD., steam, hot-water and ventilating engineers, of Crown Works, Crown Street, Leeds, have issued a book which is at once a description of their system of heating by means of low-pressure steam, and a catalogue and price list of the apparatus and appliances by means of which the desired results are to be obtained. It contains numerous designs, all of which are carefully drawn and not less excellently reproduced.

An interesting feature of the book is a series of reproductions of photographs of public and other buildings where their system has been installed. Messrs. Oldroyd & Co. make a specialty of equipping theatres and music-halls with heating and ventilating apparatus, fire hydrants and fireproof curtains, and they have recently completed such work at the Surrey Theatre, London; Theatre Royal, St. Helens; Princes Theatre, Bristol; Star Theatre, Swansea, &c.; have now in hand the mechanical ventilating and heating of the Empire, Liverpool; curtain and hydrants for New Theatre, Buxton; curtain and hydrants for the new King's Theatre, Hammersmith, London, and many others.

At the Hippodrome, Sauchiehall Street, Glasgow, they have recently completed the whole of the engineering work connected with the arena. This consists of a rivetted steel tank 42 feet diameter by 9 feet deep, fitted with a rising and falling platform mounted on a hydraulic ram and cylinder. The platform is raised by an electrically driven three-throw pump with a working pressure of 1,000 pounds to the square inch. The water in the tank is maintained at a temperature

of 65 degs Fahr. by two of the firm's "Furman" sectional boilers. This tank is somewhat similar to the one at the Hippodrome, London, where Messrs. Oldroyd carried out a quantity of their special work. They also have in hand the heating of several public and private buildings, a great feature of their apparatus being their "Furman" boilers. Their illustrated pamphlet entitled "Heat and Ventilation," a copy of which is now before us, will be sent on application.

A YEAR'S BUILDING IN THE NORTH.

ALTHOUGH at the opening of the year which has just finished the prospects of the building trade in Scotland and the North of England were not regarded as of the most roseate description, it appears from the reports which have reached us from the principal centres that the results have, so far from justifying any pessimistic views on the subject, turned out very fairly gratifying to all concerned. Taking Edinburgh, for instance, we find on comparison with the corresponding period ten years ago that the work passing through the Dean of Guild Court is almost doubled, although it does not come up to the figures of the nineties, numerically or financially. Up to date the work approved by the Dean of Guild Court numbers in all 799 warrants, and embraces 67 tenements, 216 self-contained houses, 67 villas, 103 public and other buildings and 597 alterations. The above tenements represent dwelling-houses to the extent of 19 houses of one apartment, 286 of two apartments, 101 of three apartments, 120 of four apartments, 95 of five apartments, 3 of six apartments, including 13 shops, representing an approximate value of 748,849*l.*, being an increase over last year of 118,509*l.*

Among large public buildings, there are the new Caledonian Railway Station Hotel, the North British Hotel, the important addition to the Council Chambers in Cockburn Street, &c.

The new buildings in connection with the administrative department of the County Council are making good progress, and now give a good indication of the pleasing effect of their design. A large addition has also been made to the Register House facing East Register Street. The "old" Free Church Halls have been altered and considerably extended to meet the requirements of the united bodies. The Edinburgh Medical Mission, in connection with their property in Cowgate, have demolished several old buildings at the corner of Cowgate and Candlemaker Row, and are erecting on the site a new

one of considerable dimensions and pleasing effect. Considerable additions have been made to the Royal Infirmary in Lauriston and the Sick Children's Hospital in Sciennes Road. The Edinburgh Merchant Company have completed a large extension to their premises. What was once the Hanover Hotel has been incorporated with this building, the design having been duplicated, thus making a very imposing structure. The Heriot school in Chambers Street has also been considerably enlarged by incorporating the old brewery premises in the rear and forming classrooms, &c. A larger number than usual of business premises have been reconstructed and altered in Princes Street, Rose Street and George Street, while the Commercial Bank at the corner of Shandwick Place and Queensferry Street is being well advanced. Another building which adds to the architectural embellishments of the city is that erected for the housing of the *Scotsman*.

No less activity has prevailed in the suburbs of the city, the Blackford and Morningside districts especially having shown considerable movement in this direction; while the borough surveyor of Leith, in his report on the year's building, states that, although there has been a falling-off in some directions, new tenement property is rapidly taken up, showing that there is still a great demand for this class of house, and from the way in which self-contained houses are occupied there seems to be a field for further operations of this nature. The new church of St. Serf's, in Ferry Road, is rapidly being completed, as is also the new Masonic Lodge at Wardie Road, and last month plans were passed for a large new school in the Kirkgate in connection with the Roman Catholic Church there. Satisfactory progress is being made with the new Bonnington Bridge, the foundations and wing wall of which have been almost completed, and the old bridge will probably be taken down in the course of a week or two. In regard to the Town Hall alterations, the new committee-rooms and offices are practically completed, and it is expected that these will be formally opened early in January.

From Glasgow we learn that the valuation of the plans granted by the Dean of Guild Court during the year exceeds the record of any previous year, the value for this year being 2,549,698*l.* Only once before in the history of that Court has the valuation exceeded two millions, and that was in the year 1876, which is sometimes referred to as the year of the 'height of the building fever'. The valuation for that year was 2,125,249*l.* It may be noted that the valuation of plans for dwelling-houses alone for this year amounts to 1,458,710*l.*, being

WHAT WE SAY.

VELURE.

A new and perfected Japan paint, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of common paint and one of varnish. In 120 colours. Any colour matched. Sanitary — washable. Will not crack. Will not peel. Will not blister. Will not fade. Twelve months guarantee given by the manufacturer. Saves time, saves labour, saves varnish, saves money.

C. CHANCELLOR & CO.,
13 CLERKENWELL ROAD, LONDON, E.C.

ONE GALLON WILL COVER ABOUT 90 SQUARE YARDS.

FINISHED LIKE A MIRROR.

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory Japan we ever used. I have done all the windows in the house with it.

HUGH DORRIAN, Yacht Builder.

Nunsquarter, Kirkcubbin, Co. Down, June 24, 1901.

BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.

USED ON H.M.Y. "VICTORIA AND ALBERT" AND AT SANCRINCHAM.

WHAT CUSTOMERS SAY.

ARCHITECTS' OPINIONS.

We have tried the Velure for outside and inside work, and the result is excellent. We have found no other preparation of a similar character that gives so good a surface.

GATELEY & PARSONS,
Worcester Chambers, 105 Colmore Row, Birmingham;
January 8, 1902.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.
Meadow Grange, Blean, near Canterbury: Jan. 2, 1902.

A NEW PLASTER CEILING.

I have tried your White No. 1 Velure on a new plaster ceiling without putting any foundation under it, and I certainly must say that it turned out a most excellent job.

WM. KEANE, Decorator.
25 Wellington Quay, Dublin: Sept. 23, 1901.

ON A TARRED BUILDING.

The Velure I had from you has done excellent work on my tar ground. I had sufficient to give it two coats, and up to the present time no appearance of Tar showing through has been seen. I am very much pleased with it.

JOHN B. ROSS.
Perry Hill Estate, near Birmingham: April 3, 1901.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

VELURE

more than the value of those for all other purposes. Only in one other year since 1876 has the value of dwelling-house property alone exceeded one million, and that was in 1898, when it was 1,240,410*l*. There is no reason at present to suppose that the amount of this class of property is largely in excess of the demand. The rapidity of occupation as soon as the houses are fit for habitation is proof they are required, and with regard to houses of one and two apartments there are good reasons for stating that the supply convenient for those of necessity compelled to occupy them is not equal to requirements. The records show that the building trade improved very considerably at the end of March, and this improvement appears to have been maintained to the end of the year, with improved prices, giving the manufacturers a better return than in 1901. There is also a much better outlook for the incoming year than was the case last December, and the various brick-makers are fully employed.

The building trade in Dundee, while satisfactory, has not been very brisk, and the prospects for the coming year, so far as they can be judged at the present moment, do not seem to indicate much improvement. There has been little change in the architecture of the town, the principal works which have been in progress being the rebuilding of the preserve works belonging to James Keiller & Son, Ltd., destroyed by fire nearly two years ago, the extension of the factories belonging to Messrs. James Scott & Sons and Mr. J. K. Caird, jute manufacturers, and the extension of the preserve works at Carolina Port, belonging to Lindsay & Low, Ltd. In the district a sanatorium for consumptives has been erected at a cost of 15,000*l*. Workmen have been fairly well employed during the greater part of the year, and no really good tradesman need have been without work. Fortunately the year's operations have been attended with almost an entire absence of trade disputes, and the opinion of masters is that wages will have to be reduced before they can expect much improvement. The plans of buildings approved by the Town Council during the past year represented a total value of 165,000*l*., as against 143,000*l*. in 1901 and 158,000*l*. in 1900. A large proportion of the plans approved of during the present year were for minor buildings. In connection with municipal work, the value of the works in progress during the year was 103,532*l*., of which 102,306*l*. was charged to capital. Of the total sum 58,890*l*. was for remunerative works.

Again, a large sum of money has been spent in public works, the total for the year being 102,000*l*., contrasted with 105,000*l*.

for the previous year. This large expenditure is due largely to the extension of the tramway lines and the additions to the public washing-houses. The various tramway routes are now complete, the lines which were finished during the past twelve months being the Constitution Road route and the Fairmuir route. Good progress has been made with the extension of the new esplanade, and it is calculated that by the end of 1903 the sea-wall to Ninewells will have been completed.

A fair amount of work has been done in Liverpool, which, in addition to the ordinary class of building and rebuilding, the amount of which has been fairly normal, has been embellished by the addition of some buildings of importance, among which may be mentioned the imposing premises of the Royal Insurance Company in North John Street. This building, which is rapidly approaching completion, is in the Classic style of architecture, very freely treated, and will eventually form a noble addition to the already very long list of fine examples of architecture which Liverpool possesses. In view of the gigantic character of the structure a few particulars may here be interesting. The substructure is composed of grey Aberdeen granite, the upper structure being of white Portland stone, this material imparting to it a remarkable picture of solidity and substantiality. Some idea of its immensity will be gathered from the dimensions, which give the length at over 200 feet, height from the street level to the ridge over 100 feet, whilst an ornamental tower, which adds greatly to the appearance of the building, measures from the cornice to the summit 80 or 90 feet. The tower has a square base, and is surmounted by a cupola. In the interior are a sub-basement, which contains various apartments for stores; a basement, which contains a strong room, stationery-rooms and also storage accommodation; the ground floor, which will be wholly used as the general office, with a suite of private rooms for the management at the north end; first floor, comprising a spacious and well-appointed board-room, directors' policy-room, inspectors' rooms, medical examiner's room, and a room for the foreign department; second floor, which includes the typists' department; third floor, on which are the accounts, auditors' and guarantee departments; fourth floor, on which is fitted the most up-to-date lavatory accommodation; fifth floor, with store-rooms, machinery-rooms and laundry apparatus; sixth floor, containing cistern-rooms and various store-rooms. There will be two entrances, both in North John Street, one serving the north end and the other the south end, whilst in

addition to staircases there will be in use electric elevators from the bottom to the top floor. An elaborate scheme of ornamentation has entered into the exterior, displaying ingenuity of design on the part of the architect, Mr. J. Francis Doyle, Harrington Street.

A very substantial and at the same time imposing structure is that which the Lancashire and Yorkshire Railway Company have just provided for the purposes of a goods depôt in Victoria Street. It is composed of stone, relieved with blocks of granite, and ornamental towers at the summit give it a finished appearance. One of the floors in the building is occupied as an exchange by the Liverpool Provision Trade Association.

Another building of importance from an architectural point of view is the Lewis Trust Workmen's Hotel, the terra-cotta frontage of which is of eminently pleasing design.

Amongst other works which have either been carried out or are at present in progress are the extensive additions to the Consumption Hospital in Mount Pleasant; additions to the convent buildings of Notre-Dame, Mount Pleasant; additions to classrooms, Mill Street Domestic Mission; new operating-theatre at the Royal Infirmary; additions to the Pupil Teachers' College, Clarence Street; additions to the Hahnemann Hospital, Hope Street; new dispensary in connection with the Children's Infirmary, Mulberry Street; new headquarters for the 1st L.R.E. (Vols.), Mason Street; people's bath and washhouse in Beacon Street; additions to the homes for aged poor, Aigburth Road; new cottage homes at Olive Mount, for the Select Vestry infirmary and nurses' home at Highfield, for the Select Vestry; additions to the City Hospital, Mill Road; new shops, Lord Street Arcade; telegraph manufactory off Milton Street; large building by the Lancashire and Yorkshire Railway Co. in Regent Street and Brunswick Place, for cold-storage purposes; and new tobacco factory in Hygeia Street, and other additions, by the Imperial Tobacco Co., Ltd. It is worthy of note that in several parts of the city extensive works for the manufacture of confectionery are being erected, and it is evident that this is developing into an important industry in Liverpool. There are also at present in hand a new branch of Parr's Bank in Great Charlotte Street, public baths in Lister Drive, and a refuse-destroyer at Lavrock Bank, for the south end, whilst a branch of the North and South Wales Bank has been provided in Smithdown Lane. A new electricity generating station for the Corporation is to be erected in Charters Street.

Turning to Manchester, we learn that within the year ended

October 31, 855 sets of plans for all kinds of buildings in the city were submitted for approval to the improvement and buildings committee of the Manchester City Council, and of these 754 were approved and 101 disapproved. In addition to these approvals, which related to permanent buildings, 78 licenses were granted for temporary structures. New dwelling-houses to the number of 1,662 were in the same period certified as fit for habitation. By way of comparison it is worthy of mention that in the year ended October 1898—four years ago—2,773 new houses were certified as fit for habitation. That was the largest number ever so certified within the city in the course of a single year. Five years previous to that date, in 1893, only 682 new dwellings received certificates of fitness. Thenceforward the yearly total showed steady increases up to 1898, when the highest point was reached, and since then there has been a falling off. In 1899 there was a slight decline, the figure being 2,704, or only 69 below that of 1898, but in 1900 there was a further drop to 2,308, a difference of 396 by contrast with the previous twelve months, and in the year ended October 31, 1901, there was a further reduction to 1,677, or 1,096 fewer new houses were certified than in 1898. Still the figures show that during the past five years 11,124 new residences have been constructed, so that the yearly average has been maintained well above the level of 2,000. It has often been stated that at the time when the Ship Canal was opened Manchester had apparently arrived at her zenith, and was showing signs of coming decay in commerce and industry, and of a decrease in her population. Comparison with the figure of new houses in 1893, the year before the Ship Canal was brought into use, shows that side by side with the progress of the port has gone a steady increase in the number of inhabitants of our municipal area. The borough of Salford and other areas of local government within the radius of the Canal's influence can tell tales of proportionate advancement. The sum total of residences which have sprung up as the direct outcome of the making and working of the Canal must be enormous. Three or four years ago it was publicly declared to be 20,000.

From Bolton we hear that while the year's results do not show much cause for exultation on the part of architects and builders, a gleam of satisfaction may be found in the fact that a large proportion of the work done was in the direction of alterations and extensions to cotton mills and other industrial concerns, which we may assume points to a widening out of trade.

Hardware of Ornament.

WENTWORTH SEWERAGE SCHEME.

MR. J. C. POTTINGER, M.I.C.E., an inspector of the Local Government Board, held an inquiry in the Mechanics' Institute, Wentworth, on the 18th ult., relative to an application by the Rotherham Rural District Council for sanction to borrow 3,525*l.* for sewerage works for the parish of Wentworth and the hamlet of Harley. Mr. J. H. Pickford (Messrs. Oxley & Coward, clerks to the Rural District Council) presented the application, and amongst those present were Mr. J. Platts (engineer), Mr. B. Hey (surveyor), Mr. W. Booth (assistant clerk), Mr. W. Jackson (West Riding Rivers Board inspector), Mr. G. P. Talbot (agent for Earl Fitzwilliam, and a member of the Rural District Council), Dr. Weatherbe (medical officer of health), Mr. Holmes (West Riding County Council sanitary inspector), Messrs. T. Abson, J. W. Poles and W. Dickie.

Mr. Pickford stated that the area of the rural district of Rotherham was 35,301 acres, and of Wentworth 2,341 acres. Population in 1901, Rotherham rural district 18,830, Wentworth 1,934. Assessable value, Rotherham 135,026*l.*, Wentworth 7,189*l.* Outstanding loans, Rotherham 29,771*l.*, Wentworth nil. The scheme, which had been prepared by Mr. Platts, was explained. Earl Fitzwilliam had agreed to grant a lease of the land required—2a. 1r. op.—for outfall works, &c. at 8*l.* per annum, and he also consented to give a right of drainage through his land for the sum of 150*l.* A further sum of 5*l.* was required for the right of drainage over land belonging to the Barrow School Trustees.

Dr. Weatherbe and Mr. Talbot gave evidence in support, and Mr. Platts produced plans and furnished details. The scheme has been precipitated by the action of the West Riding Rivers Board during the past two or three years.

Mr. Wood (Harley) expressed the opinion that if the storm water was excluded from the sewers, and dealt with separately, the existing system at Harley might suffice. No objection to the application was offered.

mains consist of concentric cables and are watertight throughout. In the principal streets, and in all routes where extensions are probable, the cables are drawn into stoneware casings; elsewhere they are laid as armoured cable direct in the ground. The main streets will be lit with arc lamps up till eleven o'clock, then by incandescent lamps carried on the same posts. A few streets will be lit by Nernst lamps as an experiment. The central buildings are in red brickwork with Portland stone dressings. The front portion comprises offices, workshop, stores, testing-room, mess-room and lavatories. The engine-room, boiler-house and battery-room are at right angles to this block. The shaft is one of the "Alphons Custodis" chimneys, is circular in plan, has a 5 feet 6 inch internal diameter, and is 125 feet high. There are also a pump-room, situated in the boiler-house; a water-softening plant house, an inclined way for the tipping of coal direct into the bunkers, and a well 10 feet diameter and 24 feet deep, for supply of feed and condensing water. The plant at present installed consists of three vertical high-speed engines, each coupled direct to a multipolar continuous current dynamo. The engines are each of about 100 indicated horse-power, and the dynamos are arranged so that a power supply can be given for tramway purposes if required. Steam is supplied by two Babcock & Wilcox water-tube boilers, and the steam and feed pipes are in duplicate throughout, so as to minimise the risk of breakdown. On a raised platform at the end of the engine-room nearest the office is the switchboard, from which the regulation of the dynamos and the distribution of the energy to the town is effected. On the side opposite the engines are the machines for balancing the three-wire system and charging the batteries. At the east side of the engine-room is the battery-room, in which are installed the secondary batteries or accumulators.

A CONTRACTOR'S HOME.

PADDOCKHURST is the Sussex home of Sir Weetman and Lady Pearson and their family. Sir Weetman Pearson has sat in Parliament as the member for Colchester, on the Liberal side of the House, since 1895. He is still on the sunny side of fifty years of age. He was born near Huddersfield in 1856, educated at Harrogate, and early trained into his great life-work in the firm of Pearsons, of which he is now the leading spirit, a firm which has achieved world-wide fame, and which has carried out some of the greatest engineering works of the age. He married in 1881, Lady Pearson being the daughter

ELECTRIC LIGHT AT MAIDENHEAD.

MAIDENHEAD was lit with electric light for the first time on the 17th ult. The installation is on the three-wire continuous current system. Mains have been laid in the principal streets of the town, the system being so arranged that it can be easily extended as the demand increases to other streets. The

of Sir John Cass, of Bradford. To catalogue the great works of Messrs. Pearson would be a lengthy task. As sufficient to indicate the gigantic scope of their operations, it may be mentioned that among their works have been the docks at Milford and Southampton, docks at Halifax (Nova Scotia), the Blackwall Tunnel, the Surrey Commercial Docks and the Vera Cruz Harbour Works, and many undertakings in Egypt, China, Malta and Bermuda.

The great enterprise and colossal organisation of the firm is shown by their undertaking the construction of the new Dover Harbour, but the chief work calculated to bring fame and further fortune to Sir Weetman Pearson is the railway being constructed across the Isthmus of Tehuantepec, in Mexico, connecting the Atlantic and Pacific oceans, with terminus harbours on each seaboard. This undertaking has been described as "about the biggest thing ever attempted by a firm single-handed," and it must be a source of gratification to know that British enterprise is about to succeed where French capacity and American incapacity have hitherto resulted in disappointment and failure.

To be the master mind of such a firm as Messrs. Pearson, Ltd., with contracts in hand involving millions of money, and employing thousands of men in many lands; to be constantly flitting wherever work is in hand, even to Mexico, and to be a member of the present hard-worked House of Commons is sufficient to indicate that Sir Weetman Pearson is not a man of leisure. Paddockhurst, consequently, says the *Sussex Daily News*, is the holiday home of the busy baronet, to which he fondly turns, whenever possible, for the recuperating restfulness and country enjoyment that the lovely secluded district and his beautiful home afford. It is not surprising that the Paddockhurst estate shows the mark of its energetic owner, whose great hobby is work, and whose recreation is improvement. Paddockhurst is a modern mansion, pleasing and thoroughly English in style, and in complete harmony with the beautiful surroundings. It stands on the forest ridge that runs from Turners Hill to Balcombe and Handcross, and overlooks that finely diversified range of country that embraces the wooded hills and watered vales of Balcombe, with views across a pleasant country until the distant Southdowns stop the range of vision.

Sir Weetman Pearson has been the owner of Paddockhurst some nine or ten years. The estate is one of the most up-to-date in the county. Sir Weetman's improvements set in immediately after he acquired the estate. He has built a large

wing to the mansion and also built and laid out a very fine terrace, and effected garden improvements which have made the Paddockhurst gardens famous in the county. Lady Pearson takes a special interest in gardening and Sir Weetman Pearson is fond of orchids. Money, consequently, is spent freely on the gardens of Paddockhurst, and a staff of about twenty gardeners is kept. A considerable amount of laying out and planting work is continually going on, Sir Weetman always having some improvements to effect, and never seeming weary of beautifying the grounds that surround his charming home. Three new stone-built lodges have also been erected.

The Paddockhurst estate embraces about 3,000 acres, and probably half of it is well preserved woodland, which indicates that the owner of Paddockhurst is at home with the gun. Pheasant shooting brings large parties of his friends to Paddockhurst, and Sir Weetman and Lady Pearson are the most liberal of entertainers. The kindest of welcomes always awaits visitors. Shooting and love of his gardens indicate the chief country life pleasures of the owner. His gigantic business cares and the entertainment of his friends do not, however, preclude him from caring for the comfort and well-being of those who live on the estate, which is administered with no unsparing hand. The estate extends into the parishes of Worth, Balcombe and West Hoathly. Part of it formerly belonged to Wakehurst Park estate, in Ardingly. There are many houses, including several farmhouses, on the estate. In these days of interest in the question of housing the working classes, and improving village life and accommodation, it is most pleasing to notice that Sir Weetman Pearson proves an excellent landlord, and is working out a scheme of improvement to put every house on the estate in a thorough state of repair, to rebuild where necessary, and in some cases to enlarge or restore as circumstances suggest. He has already built some fifteen or sixteen new cottages, and at Turners Hill the new houses have made a sensible addition to the village. Cottages were in great need in the district. The farm buildings on the estate are also of some magnitude. There are some very old houses on the estate, and the order has gone forth that these must be taken in hand, improved or rebuilt as they need to be dealt with, the improvement to be not only for the comfort of those who dwell in them, but the houses to be made picturesque and their surroundings beautiful; any marked old-time features they possess are, however, to be retained or restored.

Of the farmhouses and other private houses on the estate,

Users' Opinions Respecting URALITE.

CHAS. E. VERNON, Esq., Engineer-in-Chief to the
London and India Docks Company, writes:—

LONDON AND INDIA DOCKS COMPANY,
ENGINEERS' OFFICE, DOCK HOUSE,
LONDON, E.C.,

October 30, 1902.

DEAR SIR,—

With reference to your verbal inquiry, I have to say that in the construction of the Dock Company's new cold store at the Royal Albert Dock, which has a capacity of over 700,000 cubic feet, sheet Uralite was substituted for the usual second thickness, viz. 1½ inches matchlining. There is, if anything, a slight improvement in the insulation, and the great advantage of having the whole of the building, inside and out, covered with a very good fire-resisting material.

Yours faithfully, (Signed) CHAS. E. VERNON.

Note.—The sheet Uralite to which Mr. Vernon refers is only $\frac{3}{32}$ of an inch thick, and is Vermin-proof.

Messrs. FRASER & CHALMERS, LTD.,

Manufacturers of Mining Machinery, Steam Engines, Boilers,
&c., write:—

43 THREADNEEDLE STREET,
LONDON, E.C.,

October 31, 1902.

DEAR SIR,—

We beg to say that we have used the Uralite supplied by you for the roof of our new General Store at Erith, lately completed.

We found the material convenient to handle, and sufficiently appreciated its other merits to decide on using it in a large Pattern Storage building, for which we have just let the contract, specifying Uralite for the roof.

Yours truly,

(Signed) FRASER & CHALMERS, LTD.

Per W. M. D.

The British Uralite Co., Ltd., 50 Cannon St., London, E.C.

two have been already overhauled. Little Strudgates farmhouse was thoroughly restored, repaired and enlarged in 1901. Misswells, an Elizabethan farmhouse, situated within a mile of Grange Road railway station, has just been completely restored, and a number of improvements made with the idea of letting it as a private house. Here the chief characteristics of the old house have been retained. The next few years will see the other farm and private houses similarly overhauled in accordance with the indicated policy of improvement that is being worked out by Mr. G. W. Honnywill, the estate agent of Paddockhurst. Visitors to Paddockhurst are always impressed with the magnitude of the farm-buildings on the estate, those of the home farm being palatial. They were built by the previous owner regardless of cost, and not with that economy which is conspicuous when profit is the first consideration. Sir Weetman Pearson believes in raising the best stock and improving wherever it can be improved. He takes the deepest interest in agricultural questions, but does not go in for stock-raising to any great extent. The Paddockhurst farm-buildings and stables, however, are magnificent. Everything is so well designed, and attention to detail so complete that the buildings can hardly be equalled in the county. Great stability is apparent in everything; glazed bricks insure light and cleanliness, while tramways and other labour-saving arrangements are at every turn. Stock can be watered automatically, fed and attended by electric light if necessary. A feature of the Paddockhurst home buildings is the great water-tower, a mark on the landscape to be seen from many miles around. The view from the summit is a glorious one—all over the Wealden scenery, from the Surrey hills to those in South Sussex.

Mention has been made of electricity. There is a most complete electricity generating station, with powerful engines driving dynamos, generating currents for not less than a thousand lights at the mansion, and all over the estate buildings. There are builders and carpenters' shops, fitters and blacksmiths' shops, affording quite a revelation to those who do not appreciate to the full the work involved in administering a large up-to-date estate. Some 120 men are in constant employment on the estate, and at times this number is largely increased. As an employer, Sir Weetman Pearson tolerates no slackness. He is a great believer in the piece-work system, and it is introduced wherever it can be done. He pays a good wage, and so long as good work is given in return, he cares little how high a workman's wages run. To still

further illustrate the many sides of estate administration at Paddockhurst, it may be mentioned that road haulage is a great item. The nearest railway station is Rowfant. The coals consumed at Paddockhurst are estimated to amount to about 800 tons per annum. The estate has a traction engine and train of road trucks used for transport purposes, and the engine is convertible into a road roller for road-making work. Paddockhurst possesses its own laundry, worked in every department on modern principles, and sharing the luxury of electric light. It also has its own fire brigade station, powerful engine and well-equipped brigade, who make a brilliant display when attending any spectacular event in the district, and are quite prepared to deal with any outbreak of fire on any part of the estate or in the neighbourhood. The mansion is most efficiently guarded by a complete system of fire-extinguishing apparatus and appliances.

Lady Pearson is a charming hostess, and spends much time at Paddockhurst. The family consists of three sons and one daughter. Mr. Harold Pearson and Miss Pearson are keen followers of the hounds, the Surrey Stagbonds and the Burstow Foxbonds being the local packs. Both Mr. Harold Pearson and Miss Pearson are clever whips. Mr. Harold Pearson is the Master of the Horse at Paddockhurst. The finely-designed range of stables house some twenty or more carriage horses and several hunters. Mr. Harold Pearson has bred several hackneys, and was a prize-winner at the Reigate Show last spring in the yearling hackney class. The estate containing but a small proportion of arable land the stable establishment means a considerable corn bill—to the advantage of local trade. The advent of the motor car has not been overlooked by the machinery-loving mind of Sir Weetman Pearson. At least one motor car has been established at Paddockhurst, and the prospect is that several will be added. Sir Weetman is also desirous of working out a scheme of motors for heavy transport, and is not overlooking the possibilities of the motor as an agricultural implement of the future. To close this brief sketch of Paddockhurst and its owner, just a word may be said as to recreation. For the enjoyment of the national game of cricket every provision is made. There is an excellently kept ground, and the Paddockhurst Cricket Club is captained by Mr. Harold Pearson. The teams that represent the Club in the cricket field are selected from the players on the estate, all expenses are paid, and no wages stopped when workmen are upholding the cricket fame of Paddockhurst in the series of matches yearly arranged.

NEW ASYLUM BUILDINGS, BROOKWOOD.

THE Bishop of Winchester dedicated on the 15th ult. the new buildings at Brookwood County Lunatic Asylum, which have been erected at a total cost of between 80,000*l.* and 90,000*l.* These buildings comprise additional men's and women's blocks, and a new chapel, the work having been carried out by Messrs. Rudd & Son, of Grantham, from the designs of Mr. Frank G. Howell, county surveyor, Mr. Geo. Atlee acting as clerk of the works. The work was started in August 1902, and has therefore occupied nearly two and a half years. The asylum now contains 435 male inmates and 640 female inmates, and a considerable number of Surrey patients are boarded out at similar institutions elsewhere. These patients will now be accommodated at Brookwood, the new male block providing accommodation for 146 inmates and 13 attendants, and the female block for 201 inmates, 10 attendants and 24 nurses. Both are three-storey buildings, and the arrangements and fittings are on the most approved lines. The day-rooms, dormitories and single-rooms (of which there is a large number) are well lighted and ventilated, and pleasant quarters are provided for the attendants and nurses, the latter having a block to themselves. Large bay windows on the south front, fitted with seats, will meet with general appreciation, and the heating by means of Messrs. Haden & Sons' (Cromer Street, London) calorifiers is thoroughly adequate, besides furnishing an abundant supply of hot water for baths and other purposes. The lavatories are contained in spurs, quite detached, except for a single entrance, from the main buildings. The accommodation on the women's side is more self-contained than on the men's, and includes a dining-room, 56 feet by 30 feet, a sewing-room and other conveniences. The additions are substantially built of brick, with slated roofs, and are fitted throughout with electric light.

The chapel is an imposing structure in the Early English style of architecture, capable of seating 850 people, being, therefore, one of the largest places of worship in the district. It is built of yellow brick, relieved with red brick string-courses and mouldings, and has a slated pitch pine roof supported on columns of Portland stone. There are nave, north and south transepts, chancel, organ chamber—as yet without an instrument—vestry and ante-room at the west end, and the pews are of pitch pine on wood-block flooring. The aisles and chancel are tiled, and glazed tiles of art shades line the chancel walls. The reredos and font are of Caen stone, and the pulpit is of

pitch pine, while the heating and lighting are the same as elsewhere. Lead glazing and cathedral glass are used throughout, and the triplet windows which form a distinguishing feature of the chapel are much admired.

ARTIFICIAL MARBLE IN DENMARK.

THE United States Consul at Copenhagen states that the lack of marble in Denmark has led to many attempts to produce a substitute which would equal in decorative effects the natural product and would not exceed it in cost. Some success has been achieved in the manufacture of this article in Sweden, but the thin slabs would not keep their shape, inclining to bend and warp. The veins were stiff and angular, and the soft transitions of colour which make variegated marble a thing of beauty were wanting. A significant advance has been made in this industry in Denmark by a master builder of Copenhagen named Sven Schongaard, who is producing a stone of such delicate transition of tints and play of colour that it is difficult to distinguish it from the natural product; while as to cost of manufacture it can compete with all other artificial marbles. The imitation of the more expensive species does not exceed in cost that of the cheaper ones. The inconvenience hitherto met with that the mass had to be greased to prevent adhesion (thereby destroying the crystalline surface characteristic of the genuine article) has been overcome. The process of manufacture is simple and easily learnt, and the cost of the outfit is said not to exceed 35*l.* The article can be produced in any form desired—columns, plain or fluted, and capitals, as readily as flat slabs. It is claimed that even pictures may be made of this material. It seems to have the durability of genuine marble, but its cost is only about one-tenth. At the present stage of the development of the industry, the maker is able to produce a slab about half an inch thick at a cost of about 7*d.* per square foot.

AN AUSTRALIAN CONTRACTOR'S CASE.

AN action, which lasted from March 10 to May 6 last, with some adjournments, was heard in the Sydney Law Courts before Mr. Justice Pring and a special jury. It was brought by Mr. Charles Wadey, builder and contractor, against Mort's Dock and Engineering Company. The plaintiff claimed the sum of 48,000*l.* for alleged wrongful cancellation of his contract

QUOTATIONS FOR CASTINGS.

for the construction by him for the company of a graving dock at Woolwich, also for conversion of certain plant, the forfeiture of his deposit and retention money, and the loss of profit he would have made if he had been permitted to carry out and complete his contract. The defendants pleaded that by a clause in the agreement the manager of the company was authorised to cancel the contract if he became dissatisfied with the rate of progress and mode of proceeding of the work, and that the rate of progress and mode of proceeding not being satisfactory he cancelled the contract. The defendants also pleaded that the plaintiff was not always ready and willing to perform his contract. To this plea the plaintiff replied that the delay on his part, if any, was caused by the neglect of the defendants in not handing over to him within a reasonable time the site of the dock. The jury by majority returned a verdict for the plaintiff with damages 11,139 $\frac{1}{2}$, and found specially in answer to questions put to them by his Honour that defendants did not, as soon as practicable after the firm of Solomon & Bell had completed their contract for excavation, give plaintiff possession of the site so as to enable him to carry out his contract within the time and without extra cost to him; that Mr. Franki's dissatisfaction and the unsatisfactory mode of proceeding and rate of progress of the work were caused by the default of the defendants in not giving possession of the site; and that the plaintiff was ready and willing to perform the contract according to the terms thereof.

Against the verdict and findings the defendant company appealed on November 3, mainly on the following grounds:—

1. That the verdict was against evidence and the weight of evidence. 2. That his Honour, Mr. Justice Pring, ought to have directed a verdict for the defendants, inasmuch as there was no evidence that the plaintiff was always ready and willing on his part to perform the contract. 3. That his Honour ought to have directed a verdict for the defendants, inasmuch as there was no evidence that the dissatisfaction of Franki was caused by the default of the defendants in neglecting and refusing to give, and in hindering the plaintiff from obtaining possession of the site of the dock for the purpose of carrying out the work by the plaintiff. 4. That his Honour ought to have directed a verdict for the defendants, inasmuch as there was no evidence that the unsatisfactory mode of proceeding and rate of progress of the work were caused by the default of the defendants in neglecting and refusing to give and in hindering the plaintiff from obtaining possession of the site of the dock for the purpose of carrying out the work by plaintiff.

5. That his Honour admitted in evidence certain conversations between plaintiff and Franki. 6. That his Honour rejected evidence to prove that the delay of the plaintiff, if any, in completing his contract in the time specified, without extra cost and expense, was occasioned by his own act in hindering and delaying Solomon & Bell.

The arguments were not concluded until November 12, and the Court delivered judgment on the following day.

The Acting Chief Justice (Mr. Justice Owen and Mr. Justice Walker concurring) said there were seven or eight counts in the plaintiff's declaration, but there were only two with which the Court had to deal; and the first set out "that plaintiff was always ready and willing to perform the contract on his part, whereof the defendants always had notice, and had performed the same except so far as he was prevented from so doing by the defendants' breach of the contract, and except as aforesaid, all conditions were fulfilled and all times elapsed necessary to entitle plaintiff to maintain the action for the breach of the contract, yet the defendants did not permit the plaintiff to do all things necessary to duly perform the contract on his part; but before the time for the completion of the contract by the plaintiff finally and wrongfully refused to permit plaintiff to complete the same, and finally and wrongfully prevented and discharged plaintiff from completing the same, and renounced the contract on their part." Then the count went on to allege the damage plaintiff had sustained, and it was as clear as possible that the breach relied upon by plaintiff was the cancellation of the contract by the notice from Mr. Franki of June 21, and he did not allege that he was unable to get on with the contract because of the want of stone. As to the defendants' plea to that count the third alleged that plaintiff was not always ready and willing to perform his contract according to the terms thereof. Then the fifth plea set out a clause of the contract, which was to the effect that if the manager of the defendant company should be at any time dissatisfied with the mode of proceeding or at the rate of progress of the works, or any part thereof, he should have the option and full power and authority to cancel the contract. Then the plea went on to state that the manager did become dissatisfied with the mode of proceeding and at the rate of progress of portion of the work, and gave notice in writing to the plaintiff of the cancellation of the contract. Plaintiff answered that plea by a replication stating "that the alleged dissatisfaction of the manager and the alleged unsatisfactory mode of proceeding and rate of progress

of the said work were caused, if at all, by the default of the defendants in neglecting and refusing to give, and in hindering the plaintiff from obtaining possession of the site of the dock for the purpose of carrying out the work by the plaintiff, and in supplying certain incorrect plans for the purposes of the said work to the plaintiff, and not otherwise." So that the plaintiff had pinned himself down to averring that the alleged dissatisfaction of the manager of the defendant company arose from that delay, and that the delay was caused by the defendants not giving him possession of the site in accordance with their contract. The Court might take it that there was some delay on the part of defendants between May and December 1899, and that during that time, at all events, plaintiff was complaining of the defendants not giving him possession of the site of the work; but what he wished to emphasise was that that delay was immaterial as far as Mr. Franki was concerned, though plaintiff specifically alleged that delay as the reason why Mr. Franki was dissatisfied with the mode of proceeding and at the rate of progress of the work. That was the issue which the plaintiff himself asked the jury to try, and the Court had to determine whether there was any evidence to support that issue. He was of opinion on that part of the case that there was no evidence whatever that that was the ground of Mr. Franki's dissatisfaction. The evidence, to his mind, pointed entirely against such a conclusion, and if ever there was a case in which, as it seemed to him, there was abundant cause of dissatisfaction—even on the plaintiff's own showing—it was the present case. Of course if there had been evidence on both sides the Court could not order a verdict to be entered for the defendants, but it was perfectly manifest from the plaintiff's own evidence that apart altogether from not getting the stone, there were causes of delay over and over again with regard to the construction of the coffer dam in the interval between December and June that gave rise to the dissatisfaction which resulted in the cancellation of the contract. At one time plaintiff complained that he could not get sufficient labour, at another that delay was caused by insufficiency of timber, and work was delayed at another time by want of sufficient cranes. Then it was a very strange thing that if the cause of Mr. Franki's dissatisfaction was as alleged by the plaintiff, Franki himself, as was proved by the correspondence, was helping plaintiff out from the consequences of his (plaintiff's) own delay. Plaintiff had to establish his plea of readiness and willingness, but his own evidence showed that it

was physically impossible for him to carry on the work according to contract, and if he had had all the stone in the world he would not have been able to utilise it, because he had broken his contract by not having the coffer dam ready in time. It seemed to him that on the facts of the case plaintiff was not entitled to succeed, and that was the opinion of the judge who tried the case; and it was, perhaps, to be regretted that his Honour did not see his way to direct a verdict for defendants. For these reasons he was of opinion that the verdict for plaintiff must be set aside and entered for defendants.

Rule absolute to enter the verdict for defendants with costs.

THE NEW MIDLAND MANCHESTER HOTEL.

REMARKABLE progress has recently been made with the building of the great Midland hotel outside the Manchester Central Station. In the spring, says the *Manchester Guardian*, one saw little more than its framework, vast beams of iron raised on end and spread over the acres of land which form the site. The tall chimney which stands separate from the main building had been raised, but portions only of the walls showed behind the tiers of scaffolding. Then American ingenuity was joined with English skill and labour, and the building rapidly came near completion. The roof is now being placed upon the topmost storey, the scaffolding is coming down, and it is possible to see what the whole design is like. The building is so great that it dwarfs nearly everything around it, and makes more apparent the narrowness of the streets near which it stands. To some people no doubt the statement that the cost of the whole undertaking has to be set down in seven figures will sufficiently convey an estimate of its magnitude. Others may better realise its extent in recalling to mind the buildings that formerly stood on the same area. Besides much warehouse property, there had to be removed the Gentlemen's Concert Hall, the People's Concert Hall and the Lower Mosley Street schools. The area covered by the hotel may, in fact, be roughly stated at a couple of acres. As a preliminary measure the buildings mentioned had to be demolished, and then the work fell into the hands of the builders, Messrs. William Brown & Son, of Salford. First of all there was the excavation for the foundations, many feet below the street level. The site was cleared and the soil removed down to the rock, and the foundations had of necessity to be

LIVERPOOL.

Liberal Commission allowed to BUILDERS AND
ARCHITECTS for introduction of Business.

Subscribed Capital, £2,228,875.

solidly laid. This part of the undertaking was begun in September 1899, and it was not until March 1900 that the actual work of building was entered upon. For the first 26 feet, rising from the pavement, the front elevations are built of red Aberdeen granite with Shap granite bands, and from that distance to the roof they are of terra-cotta bricks. From the first floor there will be access to a balcony from which those in the hotel will look down upon the great spaces which are to be arranged in the interior of the structure. The general character of the scheme of the hotel may perhaps be best gathered from a detailed description of its parts.

The basement is confined to the usual stores of an hotel and the necessary appliances for heating and ventilation. The scheme for the latter purposes is intricate and elaborate. In the basement also provision is made for baths and the like. In the intermediate basement there are hair-dressing saloons, bath-rooms, kitchens and the like. The ground floor on the Peter Street side has an entrance about 19 feet wide, which leads into a carriage court, with an inward and an outward way for vehicles. From this part it may be noted that access is given to a fine octagonal-shaped lounge on the first floor, which has a balcony for the purposes of a band. From the lounge one may pass on the extreme left to a large room to be used as a coffee-room, or on the right to another which will be a French restaurant. On the Mount Street side of this restaurant there will be a covered court or winter garden—a large rectangle—which will have a raised terrace or platform for promenading purposes. Beyond the French restaurant and the winter garden will be private dining-rooms. From an entrance to the hotel in Mount Street access will be given to a luncheon-room, whose windows will overlook Peter Street, and to a restaurant—on a larger scale than the French restaurant—with windows overlooking Mount Street. Besides the entrance in the latter street already mentioned, there will be another nearer the centre of this side of the block. There will also be an entrance for the purposes of business and telephone communication. In Windmill Street will be found an entrance practically given over to the purpose of conveying luggage into the hotel. Following the line of the building towards the Central Station, one reaches another of the principal entrances, directly opposite the station. This will lead at once into an entrance hall for the new concert hall, which takes the place, under the terms of acquisition by the company, of the old Gentlemen's Concert Hall. From the entrance the concert

hall is approached by steps, and one thus reaches a great and convenient room whose dimensions will be of some 96 by 46 feet. Here it is hoped that the long-famous Gentlemen's Concerts of Manchester will be resumed with the same success as in days gone by. Care has been taken in the design of this room to make it suitable for concerts. The street line of the building along the frontage leads, of course, to Lower Mosley Street, where there are entrances to the stage and dressing-rooms of the concert hall, to the hotel dressing-rooms and also to the kitchens.

So far there has been chiefly indicated the character of the ground-floor accommodation. The concert hall, which is entered from Windmill Street, is, however, on the next floor above, and is reached by a marble staircase. On the left of the hall are lounge and reception-rooms. The lounge, already described as octagonal in shape, is entered from Peter Street. From this entrance passages lead on the one side to a private ball-room and dressing-room, and on the other to a billiard-room. Passing into a long corridor the visitor finds on this floor a number of private dining-rooms, bedrooms, bath-rooms and sitting-rooms running round the various sides of the building. On the second floor is a winter garden or covered court with an octagonal roof. The ventilation and efficient lighting of this has been well provided for. There is on this floor a continuous corridor leading to bedrooms and bath-rooms. On this floor also, as the building is now, one sees numerous preparations for lifts of the newest type for passengers and luggage. There is an intention on the part of the company, it is said, to introduce those of the newer American and Continental methods which are thought favourable to our insular tastes. But of this of course it will be more possible to write in the autumn of next year, when the building will probably be ready for occupation. Passing to the third floor, one is brought to a continuous corridor, which runs all round the interior of the structure. Here the great space representing the open court is well seen as a decorative feature. The fourth, fifth and sixth floors are practically in arrangement a repetition of those below, and we reach the Mansard roof, which is composed of steel and fireproof materials. The whole structure has about 480 rooms, and of these 400 are bedrooms. It is constructed very largely of steel, and is fireproof throughout.

It is said that the building work done during the past few months makes "a record" for swiftness and stability. It has been done by British labour directed, on behalf of the company, by American skill.

ARMOURED FIRE DOORS

Telephone,
No. 143 Westminster.

Telegrams,
"Sprinkler, London."

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

Will NOT Buckle or Twist out of Shape.

ALSO MAKERS OF THE ARMOURED URALITE DOORS. Full Particulars on Application.

**HOT WATER AND
STEAM HEATING INSTALLATIONS,
HIGH AND LOW PRESSURE. VACUUM SYSTEM.**

GRINNELL AUTOMATIC FIRE EXTINGUISHING INSTALLATIONS.
FIRE PUMPS AND FIRE APPLIANCES OF ALL KINDS.

MATHER & PLATT, L^{TD}. Park Works, Manchester; & 14 Victoria St., London, S.W.
And at Glasgow, Leeds, Birmingham, &c.

The Architect.

THE WEEK.

THE sudden death of two men who were taking baths on the 23rd ult. in the Fulham Public Baths having been inquired into by a coroner's jury, a verdict was returned to the effect that death was due to syncope, caused by an electrical shock; that such death was accidental, and owing to faulty design and construction of the electric installation; but they were unable to say on whom the blame rested. There is something contradictory in the findings, for if faulty design and construction were proved, then it was not difficult to attribute blame. It would have been wiser to have stated that electric power is not as yet thoroughly comprehended, especially in its action on human beings. Everyone who has undergone electric treatment is aware that baths having electric energy are common. But the effects are anticipated, and on that account not much inconvenience is suffered. At Fulham the suddenness of the attack may have produced excessive alarm, and with some constitutions syncope would follow. Two witnesses experienced shocks on the same day without any injury. The fatality should, however, be regarded as a warning. From its invisibility electric force is not truly realised; the dangers are either absurdly exaggerated or neglected. In public baths, where "larking" is not unknown, it is not prudent to allow wiring or any agency in a system to become obtrusive, for meddling would be a temptation. But if wires are concealed they should likewise be earthed, in a technical sense, for the force will take advantage of the least weakness. At Fulham, according to one technical witness, the only defect was in the connection of the wires and lamp-holders, but that was sufficient to cause fright and syncope, which was fatal. Henceforth care should be taken that nothing can possibly be touched by ignorant people which, however remotely, can become a source of danger.

PUVIS DE CHAVANNES was an innovator like M. RODIN, and there is some fitness in selecting that sculptor to produce the memorial of the painter which is to be set up in Paris. Evidently M. RODIN is not disposed to undertake an experiment corresponding with his amorphous statue of BALZAC. It would not be adapted for a gentleman so precise in his ways as PUVIS DE CHAVANNES, and who was so well represented "in his habit as he lived" in the full-length portrait which is one of M. BONNAT's masterpieces. M. RODIN this time proposes a simple monument. He has already modelled a bust of the painter, and he contemplates placing it on a stele of his own design, which will be flanked by "the genius of repose in eternal glory." It is difficult to imagine what that kind of figure will be, but we may be sure it will be characteristic of the sculptor, and will not be suggestive of any genius already existing. Whether the work will be in bronze or marble has not been decided.

ONE of CARLYLE's successes was the resuscitation of Abbot SAMSON, of Bury St. Edmund's. The stout monk, in all his strength and weakness, appears as a living being. There is a feeling of satisfaction in the minds of most readers when in the progress of the story SAMSON, to the surprise of many, is raised from the humble post of sub-sacristan to the abbot's chair. HENRY II. seemed to think a joke was being played, for when SAMSON and the monks came before him, he said:—"You present to me SAMSON; I do not know him. Had it been your prior, whom I do know, I should have accepted him. However, I will now do as you wish. But have a care of yourselves. By the true eyes of God (*Per veros oculos Dei*) if you manage badly I will be upon you." Afterwards when the king heard him singing a psalm he again swore his favourite oath and thought that SAMSON would well govern the abbey. SAMSON was a reformer after CARLYLE's heart, for he was inimical to *verbosi*, or windbags. He built, we are told, "many useful, many pious edifices, human dwellings, churches, church steeples, barns, for all ruinous incomplete things, buildings or other, were an eye-sorrow to the man." How or when he died is not stated by his biographer

JOCELIN, all that is related being that he departed for France to advise King RICHARD. In a record of the abbey which is preserved in the town library at Douai, the burial-places of some of the abbots or priors are described. SAMSON is said to have been interred at the feet of Abbot OVDING in the chapter-house next to the pulpitum. Last week coffins and skeletons of five abbots were found in a line down the centre of the chapter-house floor from east to west. It is assumed the remains are those of Abbots OVDING (d. 1157), SAMSON, HENRY, RICHARD DE INSULA and EDMUND DE WALPOLE. The skeleton of Abbot HUGO, the predecessor of SAMSON, who allowed the monastery to fall into a state of bankruptcy, has not yet been discovered.

It is commonly credited that in Germany there is less difficulty in making arrangements for restoration than with us. The majority of the old buildings, whether secular or religious, are more or less under Government control, and under those circumstances the adoption of a plan for repairs or alterations might be presumed to rest entirely with officials. In practice, however, it is found that restoration gives rise to much controversy, and in consequence the work is often long delayed. This has been the case with the cathedral of Meissen. The building is of great age, parts belonging to the tenth century. Three times the western tower or towers were destroyed; once in 1222 by fire; and it was not until between 1399 and 1410 new towers were erected. In 1413 they were cast down in a storm. In 1481 a new tower was constructed; it was probably designed by ARNOLD of Westphalia, and was also destroyed in 1547. Subsequent to the Reformation the cathedral was injured by lightning, and the towers continued to remain in an incomplete state. Six years ago a society was formed for the restoration of the building. Several plans were prepared. Discussions followed, and it now appears the society is divided into three parties. The design of Herr SCHAFER, of Carlsruhe, by which two towers would be introduced, is generally preferred. To a second party the design by Professor LINNEMANN, of Frankfurt, is the most eligible; it proposes the creation of three towers, and corresponds to some extent with the arrangement of ARNOLD of Westphalia. The author, however, has publicly announced his preference for the rival design. Many members are in favour of a project by Professor GURLITT, from which towers are omitted on the supposition that they would not be in keeping with the rest of the cathedral. Under the circumstances, it is more likely that the building will be allowed to remain as it is than be graced with accessories in the form of towers. About a year ago it was announced that Herr SCHAFER's plan was to be realised.

AN open-air sanatorium for male sufferers from consumption has been erected at Bligny, near Paris, under the direction of M. LUCIEN MAGNE, the architect. The ground is elevated, and the buildings are placed on a plateau which enable the "galeries de cure" to face the south, whilst the chambers of the patients at each end form angles with the gallery, and respectively have a south-eastern and south-western aspect. On the north side of the gallery there is a corridor partly open, but which can be closed and heated in winter. The corridor is continued behind the chambers, and a patient will therefore have only a short distance to traverse between his room and the gallery, the roof of which is inclined in order to diminish the shadows cast on the inmates. The gallery is painted light blue, as it is believed colour is not without its influence on invalids. Each chamber contains three beds, and a glazed vestibule leading from the gallery will afford those in the room a view of the grounds, as well as to permit of supervision from without. The floors are of cement on béton, with brick beneath and steel joists. There is no necessity for joints with a cement surface, and therefore dépôts for dust will be avoided. The floors are slightly inclined to facilitate cleaning. The dining-room is on the ground floor, while the "salle de récréation" is on the first floor. The stairs are in stone, so arranged as to diminish the exertion of ascent by the patients. M. LUCIEN MAGNE has endeavoured to be economical, and everything that could be considered useless or superfluous is avoided, although nothing is absent which could add to the comfort, solidity or salubrity of the buildings.

"ASIA"—"AFRICA." BY SIR EDWARD J. POYNTER, P.R.A.

THE ACADEMY WINTER EXHIBITION.

NOT only architects, but every student of the philosophy of art, must experience satisfaction in seeing one of the galleries assigned to the drawings, photographs, plans and casts which illustrate some of the results of Mr. EVANS'S excavations on the site of the Palace of Knossos in Crete. The collection will only be on view during the present month. Later it will be less easy to trace the relationship between modern and ancient painting. It is assumed that the palace was destroyed in the fifteenth century before the Christian era, and the examples of art in the building necessarily belonged to a much earlier period, but there is evidence of still older buildings on the site which afford relics of decorative art that "go back well into the third, and probably into the fourth millennium before our era."

The house of MINOS might be compared, for the number of its chambers, with the palace of the Escorial. At the first glance it resembles one of those mazes or puzzle-pictures which are devised for the amusement of children. It would have been an advantage for the ordinary visitor if the corridors, halls and approaches had been coloured, for in that way the difficulty of reaching certain chambers would be manifest at a glance. MINOS had the reputation of a tyrant, and it would be safer for him to be able to change his apartment whenever he pleased. There may have been degrees of inaccessibility among the rooms. According to tradition he was well served by DAEDALOS, the mythical artist, who was assigned the title of "Hero," and who was either the grandson or great-grandson of ERECHTHEUS, the king of Athens. Like PROMETHEUS, he was said to have been instructed by MINERVA herself. Few can believe that the many-chambered dwelling was arranged for the Minotaur, "the son of MINOS and of PASIPHÆ." But the subtle ambages might well be taken as a confirmation of the terrible legend.

We can see a monstrous bull as an element in the decoration, but it only appears in a contest with male and female toreadors whose forms might be outlined by means of curved rulers. A similar elongated animal is often found on vases and in reliefs. The decorations, so far as can be judged, are in no way suggestive of terror or mystery. The lily was in favour, and it is sometimes treated in a way that comes very near the French *fleur-de-lis*. There is also an exquisite species of ornament consisting entirely of leaves. The Egyptian lotus was likewise adapted. A stone lamp looks as if it had been copied from a beautiful capital derived from plant forms. In the throne-room red prevails, black being used as a contrast. There is a ceiling which is most ably modelled, the plaster being coloured in blue, white, yellow and red. The gypsum throne could only seat one person; the back is perpendicular and the sides form a continuous wavy line. The seat is supported by a conical arch which at a distance might be taken for a Gothic arch, and what is more remarkable there are crockets springing from the uprights or piers. The artists were not afraid to imitate marble by colouring plaster. There is a bull's head in relief coloured from life, as well as an arm and breast of a man and a head of a lioness, which reveal the perfection

attained by sculpture at that early period. It has been sometimes supposed that the column above the Lions' Gate at Mycenæ had been put up wrongly, as the widest part is above, but in the columns at Knossos we can see the same peculiarity of reversal. The gateway is also recalled by figures of two animals that seem to act as supporters for the figure of a goddess standing on a pedestal. The casts, drawings and photographs must modify all theories hitherto accepted about ancient Greek art, and on that account we advise our readers to lose no time in visiting the gallery.

We must jump over a long interval, say three thousand years, during which art has advanced and declined, was buried and reborn, before we come to the period next exemplified in the exhibition. The Venetian pictures are not numerous. They include, however, the two noble works from Hampton Court Palace by TINTORETTO, *The Nine Muses in Olympus* and *Esther Fainting before Ahasuerus*. Both, we believe, belonged to CHARLES I. The *Muses* was valued by the Parliamentary experts at 30*l.*, and was sold for 100*l.* WAAGEN says it is deficient in arrangement, but of great power in colouring and care in execution. BURGER speaks of the figures as all having "une tournure superbe," and one which is seen standing on the right side, with her back to the spectator, might have been sculptured by MICHEL ANGELO.

If the popular tradition that the painter dashed off his pictures in a fury can be accepted in respect of this work, then TINTORETTO was an exception to all experience of painters. There is no sign of expedition or haste in any part of it. It was a saying with his countrymen that he had three pencils, of gold, silver and iron: the first must have been employed on the *Muses*. It is needless to say there is no Greek spirit to be found. The introduction of a spinet and a globe is not the only anachronism, but defects of the kind seem trifles and are more than compensated by the power displayed in the figures. In the *Esther* there are even more figures, but they are all draped, and the costume is partly Venetian, partly hybrid-eastern. As in most Scripture scenes of the period the event is clearly suggested. The execution is more characteristic of the painter as "Il Furioso" than its companion, for the boy in the foreground holding a cat is so ill-proportioned, he must have been produced in a hurry.

There are also three works by PAUL VERONESE. *Venus and Mars* reveals more fancy than is usual with the painter. One cupid is engaged in binding the limbs of the pair, while the other keeps the war-god's horse at bay, and the animal, it must be allowed, is so badly painted as to suggest the handiwork of a Venetian assistant who had never seen one alive. The *Annunciation* is sober in colouring. The scene is represented as taking place in a grand architectural colonnade, with a floor laid out in strict geometrical patterns; the surroundings are therefore different from what would be employed by a modern artist. In the upper part the ALMIGHTY is seen with angels. The *Salutation*, by VERONESE, must have been seen by RUBENS when he painted a similar scene. The tradition about LA FORNARINA'S coarseness is supported by SEBASTIAN DEL PIOMBO'S portrait; if it be a genuine likeness, then the head in the Florence gallery ascribed to RAPHAEL, and

bearing that title, must belong to a different subject. "The emblematical subject," which used to be known as *The Virgin with Child and Saints*, by BONIFAZIO, has much of TITIAN's manner. The portrait of a Cardinal, by GUIDO, in which is an extraordinary arcade as a background, is of little value, and is more of a painting of robes and lace than of an individual.

A whole gallery is devoted to ALBERT CUYP. We believe there are more examples of the master in England than in all the public galleries united of Holland. How he came to seize upon English amateurs is not easily explained. His pictures are certainly full of repose, and recall country life. He was also admired for his skies, and there was some reason for calling him the Dutch CLAUDE. TURNER once accepted him as an interpreter of nature. But the skies have faded, and after the long period of SIDNEY COOPER it is difficult for anybody but a breeder or a dealer to keep up an interest in cows. The pictures by CUYP on the walls vary in the number of cows that appear in them. In one there are eight, in another six, a few have two. A landscape deserves to be noticed for having only one. CUYP, however, was able to produce work of another kind. His *Prince Henry Frederick at the Siege of Breda* deserves commendation from its dissimilarity to contemporary French war-paintings, for the Prince and his officers do not seem to be elated, and the signification of the scene is suggested by men carrying a bier. A portrait of himself, and others of girls, are realistic examples. *The Castle of Nemwygen* is a very large architectural piece. There is also a *Christ Entering Jerusalem*, which is curious, but is somewhat more elevated in character than similar works by CUYP's countrymen. A quaint gateway is introduced surmounted by an obelisk.

The English school has several representatives. REYNOLDS did not paint many landscapes, but a very dark wooded scene with hills in the distance is hung in the first gallery. It has suffered like all his works, but originally it must have been effective. The portrait of the Countess Powis was, it appears, originally painted in 1777, and was altered in 1786, when a very large hat was introduced. The painting is in excellent condition, and the action of pulling a long glove over the left hand and arm seems natural. The most important is the full length of Mrs. PELHAM throwing grain to poultry and pigeons. RUSKIN once remarked as a sign of weakness in the painter that, in thinking over his examples, instead of naming a *Madonna de San Sisto* we can only say *Mrs. Pelham Feeding Chickens* as the culminating example of his work. But the critic might have recalled that many of RAPHAEL's Madonnas, as well as those of other painters, are no more than portraits. With such a subject as Mrs. PELHAM the Italian would at least have made a saint of her. But what advantage, spiritual or otherwise, would that be for the lady or those who looked on her portrait? Is it not more charming to see a young English housewife engaged in domestic duties? The flowered dress is in keeping with the scene. The portrait of *Mrs. Elizabeth Hartley and Child*, the latter being entirely nude, might be taken as a type of nature herself, from the love and joy shown upon the face of the handsome young actress.

The works by GAINSBOROUGH will hardly uphold his reputation. They exhibit the eccentricity into which he sometimes fell in avoiding academical rules. *The Market Gardeners* will be remembered by its extraordinary steep bridge with an enormous keystone and the inclined paling, rather than by the figures. All the work seems to be concentrated on one side of the painting. Another unconventional example is the *Going to Market*, showing a number of people with horses; it is so lightly handled as to appear as a sketch. In GAINSBOROUGH's time a brown tree in the foreground was supposed to be indispensable by some authorities. It may have been in derision of the rule that he painted *The Fallen Tree*, in which a great twisted and gnarled trunk with bare branches is thrown across the foreground. It has a strange effect and spoils what might have been a fine landscape. The principal figure-piece by GAINSBOROUGH is *The Shepherd Boy*, an oval canvas, very simple in style.

Among the early Academicians RICHARD WILSON appears the most important this year. In his Italian works he felt himself compelled to accept certain elements which

were long in favour—ruined buildings being amongst them; and it is sometimes difficult to determine what variety of tree he represents. But shortcomings of the kind hardly affect the warmth or grandeur which those Italian or imaginary scenes offer to view. His *Lake Scene*, his noble *View of Rome* and the nameless landscapes show true genius. In his *Atalanta and Meleager* we see on one side a foaming torrent as a background to the slaying of the wild boar, while on the left side the low circular tower, the bridge of many arches and the country form a peaceful scene which seems remarkable when contrasted with the opposite side. The *Apollo and the Seasons* is another excellent example of the classical landscape which is now out of fashion, but which allowed imagination to exercise itself. ROMNEY is represented by two portraits of daughters of the first Lord CLIVE. There are three landscapes by PETER DE WINT, one having for subject old houses in Lincoln, which show how well the water-colour painter could work in oils. There was not one of his contemporaries who was more partial to English scenery. There is also a landscape by GEORGE VINCENT, a painter whose works are but rarely exhibited. There is a farmyard by GEORGE MORLAND, in which a pig luxuriates. It is thinly painted, and yet the colours have stood better than in more elaborate works, and the whole scene appears unlaboured.

JOHN CONSTABLE once more reveals his strength, and no landscapist of any age was more successful in suggesting that nature was a force always at work and not an assemblage of lifeless phenomena. The *Opening of Waterloo Bridge* may not seem an event that was adapted to his pencil, but a figure-painter could not have conveyed with more success the impression of excitement which must have prevailed at the time. The array of soldiers, the gorgeous barges, the officials, the crowds of women in bright dresses, the coloured flags may all have been gaudy, but to CONSTABLE's eyes they must have formed a pleasing spectacle, and he could not help sympathising with the manifestation of so much life. The *Lock*, the *Opening the Lock*, and the *Dedham Lock, or the Leaping Horse*, suggest his delight in combining earth, air and water, and the exuberance of vegetation, although it took the form of weeds. In *Salisbury Cathedral* he ventured on the somewhat daring experiment of putting a very tall tree in juxtaposition with the famous spire, as if to contrast art with nature; and in *The Rainbow* we have the cathedral itself deriving interest and relief from a small piece of green meadow which CONSTABLE could paint well, although he never cared much for cultivated ground. In *Yarmouth Jetty* he was painting under restrictions, and here we see a gentleness which is charming. There is one portrait by Sir MARTIN SHEE: the subject is HENRY THOMPSON, R.A. Probably not one visitor ever heard of that Academician or saw one of his works, but he was for a time the Keeper of the Academy; he was a pupil of OPIE, contributed to the Boydell Shakespeare Gallery and produced several high art pictures. He died in 1843. SAMUEL SCOTT in his day gained a reputation for sea-pieces, but his topographical views were admirable, and some of them were engraved: his painting of Pope's Villa is almost as literal as a photograph.

As usual, the examples by TURNER must give rise to regret at the un pitying power of time. Whether he painted in his early manner, laboriously, or in his prime, when his hand seemed light enough to paint the lily or to add new colours to the wings of butterflies, the years have shown scant mercy to his efforts. There are half a dozen of his works, and they all are interesting. The *Boats carrying out Anchors and Cables to Dutch Men-of-War*, which was exhibited in 1804, shows the power which he possessed as a wave-painter. It was produced between *Calais Pier* and the *Shipwreck*. The *Modern Italy*, which was formerly known as *Tivoli*, will suggest by a contrast with the preceding the marvellous advance in technique of the artist. The picture was engraved some half a century ago, and a glance at the plate will reveal how much deterioration has been caused in that time. Originally it was called *Composition of Tivoli*, a title which should be retained, for it suggests the scene which inspired TURNER's imagination, but from no point of view at Tivoli will so glorious a prospect be visible. RUSKIN says the near foliage is purely English. Compared with it the

Newark Priory, with its river and barges, becomes most prosaic. Another wreck that is to be deplored is *The Approach to Venice*, which was exhibited in 1844. RUSKIN says at one time it was beyond all comparison the best of TURNER'S Venetian pictures, but, he adds, "it is now only a miserable wreck of dead colours." It was inspired partly by BYRON'S lines:—

The moon is up, and yet it is not night;
The sun as yet disputes the day with her.

Originally there was a conflict between the two lights, and the deep reflections in the water were understood; now, if we look at the scene impartially we cannot say how they were caused. The *Fifth Plague of Egypt*, a work of 1800, when he was supposed to be under the influence of WILSON, is a daring attempt to grapple with one of those tragic scenes in which the fearful forces latent in nature work their way. As he used in the description the words from the Bible, "And the LORD sent thunder and hail and the fire ran along the ground," it was evident that TURNER had no desire to conceal his ambition. At the time he was an Associate of the Academy. It was difficult in those days to obtain information about a foreign country without visiting it, and TURNER'S Valley of the Nile does not in any way correspond with the reality. But it was an architectural picture in which lofty buildings, arched bridges and other products of construction were mixed with pyramids. It is now very dark, and in spite of the corpses in the foreground cannot be said to realise the scene, but it has biographical interest as suggesting how the artist of twenty-five was not oblivious of the dark side of nature.

(To be continued.)

THE SOCIETY OF OIL PAINTERS.

IT would be affectation of hypercriticism to belittle the exhibition of the Society of Oil Painters, which was opened this week. Amidst nearly 400 works we must expect that, whatever be the standard set up, some will not attain it. Art, like everything else, has its price, and when a painter asks no more than ten guineas for a work it would be ridiculous to expect a masterpiece. A visitor who will confine himself to the examples which are rated so low will, however, find much which is interesting.

What is perhaps most enjoyable in one of the Society's exhibitions is the endeavour which is apparent to seek after novelty if not after originality. It cannot be denied that successful artists have no need of that kind of exertion. The purchaser of pictures who is ambitious to form a collection generally believes in mannerism. He wishes to possess examples which his friends can identify at a glance. Painters must be allowed to take advantage of the whims of their patrons, and consequently we see in the Academy exhibitions year after year—and a like circumstance is observable in the French Salon—pictures which differ from their predecessors mainly in the titles. The Piccadilly gallery can always show scenes which puzzle the frequenter of exhibitions, for they seem to be familiar to his eyes, but on reflection he realises that he was misled by confounding a close resemblance with identity. The majority of the artists who belong to the two societies there collected are not bound by any necessity to be consistent. They can always make ventures in new directions, and if they do not attain success they afford spectators the pleasure of a surprise. This year, for instance, we have Mr. CHEVALIER TAYLER in his *By Chance or Design* presenting a pair of lovers in fifteenth-century costume meeting in a wood. Mr. DUDLEY HARDY in *Idlers* shows Eastern critics watching a game of chess. Mr. STOCK in *Dead Summer*, always so careful in detail, depicts a fine head lying on a brick wall of so defective a character that a jerry-builder would disown it. In this case, one may ask, Where is the body? but a similar question must arise in the minds of the possessors of M. CHAPLAIN'S grand medal of the last Paris Exhibition, for on it the head of France springs from the ground like a flower. Mr. STOCK'S calling of a sprite's locks which fall over rocks the *Cascade* may be excused by the beauty of the figure. Mr. HERBERT MARSHALL, who has been identified

with London buildings, has forsaken them in favour of Whitby, and instead of fogs we see the northern mist which has often been rendered far less effectively. There is no artist who is so much fascinated by snow as Mr. FARQUHARSON. In his *Crofter Village* we have the strong lights and shadows which are only visible in summer, and we wonder some of the sanitarians do not inquire where the village is found, for in hot weather it should, if science is to be credited, be a plague spot. Everyone remembers the appeals on canvas for miserable children which Mr. KENNINGTON used to produce. This year, in the *Pedlar*, he suggests how the prehistoric trinkets found in excavations were acquired. In the primitive and sunny time the women could dispense with clothes, but after the trader's visit necklaces were sure to be indispensable. A new light is cast on archæology by the artist. Another ancient scene, less idyllic but it may be nearer to reality, is Mr. MATTHEW HALE'S *Fight for a Wife*, two men struggling in one of the ancient corrachs. Mr. JOHN LAVERY is generally known as a portraitist. In the *Bridge at Gres* we have a French scene painted in a French manner. But a longer distance than the room affords is needed for a standpoint if justice is to be done to the view. Mr. BYAM SHAW, who is usually allegoric, in the *Poet* gives what appears to be a side view of CHAUCER walking in the fields. We might cite other examples, but enough has been said to suggest that the painful toil of discovering new subjects is not unknown to members of the Society.

There is much that is familiar, and yet is satisfactory. Many as have been the representations of the fallen Campanile, not one can recall the structure so vividly as Mr. LOGSDAIL'S *The Tower that was*. Knowing Venice thoroughly, and appreciating architecture, his buildings are no mere scenic display. Mr. TOPHAM, who is familiar with Italian ways, has made a humorous scene out of one of the lions which support church porches in his *Captured*, for a young servitor in a red cassock and surplice bestrides the figure. Another successful Venetian scene is Mr. PIKE'S *Venetian Market Place*, in which, as is usual, there are more sellers than buyers. Mr. HENNESSY'S *Study near Bordighera*, a boy on a donkey with a girl looking down from above, is also true to life, and is almost French in the treatment of the old house.

Mr. N. M. LUND has attempted a daring experiment in his large view of *London*, which is taken from the campanile of the Royal Exchange. The area extends in one direction to the Albert Hall and in another to Hampstead. It is not often scenes of the kind are so thoroughly worked out, but foreigners are likely to take more interest in the painting than City men. Another work in which architecture predominates is Mr. D. Y. CAMERON'S *Dark Angers*, showing the bridge over the Maine and the old castle with its numerous towers. The view is sombre, as befits the place. No less remarkable, and more lightsome, is *Spring Blossoms, Touraine*, in which an old castle is seen rising over the river bank with its stiff and pruned poplars. Mr. COTMAN has only one view, *The Meeting of the Waters, Southampton*, in which a large expanse of sea and land is visible, and is bright with sunshine. The president, Mr. WALTON'S, principal work is *Cuckoo Cherry-tree*, which is delightful from its wealth of blossom. Mr. MELTON FISHER has a fine view of Venice, but as an example of colouring we prefer his lady reading, with a large bunch of poppies beside her, which is called *This Ancient Poesie like Poppies' Fragrance*. One of the most striking experiments in colour is Mr. L. R. GARRIDO'S *All Alive O!* a girl in black who is laughing while looking towards a spectator, and exhibits herrings in a basket, which form a *coup de main*. Mr. REGINALD FRAMPTON'S *St. Catherine* is out of place amidst so much of the earth, and it has been unfairly skied. It is in the Mediæval manner, limited in the number of colours used and severe in the drawing, but it might easily be made to appear as a copy of a panel by a monastic painter. Mr. A. MANN has a gorgeous sunset which could easily enhance some noble incident, but it suggests a waste of power when we find it serving no higher purpose than to exhibit a few sheep. Mr. A. G. BELL'S *Breezy Day in the Netherlands* suggests motion in air, canal and trees. Mr. W. H. BARTLETT is again successful with two sympathetic scenes on the west coast of Ireland, the *Dulse*

Gatherers and Sunshine and Shadow. Mr. BUNDY's humour is unforced in his *Three Generations* of hunters in red coats, and from the handling it is almost supreme on the wall. Mr. BRIDGMAN, the American painter, in his

Children of Algiers and Street in Flemen upholds the reputation gained by many Eastern scenes. Altogether the exhibition is enjoyable and excites anticipations of future excellence with many of the painters.

A FRENCH RENAISSANCE STAIRCASE RAMP.

ONE of the difficulties when arranging a ramp arises from the use of vertical lines in the composition. They afford more of a contrast than a combination with the inclined lines which have to follow the slope of the stairs. In the above example from one of the old French châteaux vertical lines are omitted, and a kind of figure is introduced which can be modified to suit any angle.

GROVE VALE, CAMBERWELL, IMPROVEMENT

THE slopes of Grove Hill, Camberwell, eulogised in the poems of W. Morris and Scott of Amwell, have witnessed many scenes, but none more interesting than the inauguration of a housing scheme. For years the meadows forming the valley known as Grove Vale at the foot of the south-eastern slopes of the hill, while lending enchantment to the view, have effectually barricaded every direct approach to East Dulwich station and neighbourhood, and have caused Copleston Road, Placquet Road, Bellenden Road, Placquet Terrace, Oglander Road and Wildash Road, which all infringed upon the boundary fences, to be *culs-de-sac*. The Borough Council of Camberwell after prolonged negotiations purchased these meadows (which formed portions of two estates), of a total area of 8 acres, for the sum of 8,000*l.*, in order to provide sites for the housing of the working classes, and this afforded a means of effecting a very desirable improvement by opening out the roads. The roads have all been made up, and the footpaths temporarily laid with tar-paving, so that the inhabitants have had the earliest possible use of this improvement. A portion of the estate has been used for a much-needed extension of Grove Vale depôt, and the remainder will be used for housing purposes.

The new roads will give frontages to 85 houses, which will contain about 170 tenements for the working classes, and, it is hoped, will tend to lessen the overcrowding on the northern fringe of the borough. The work of laying-out the land was started on September 29 by men in the direct employ of the Council under the direction of the borough engineer, and completed in ten weeks. When it is mentioned that 3,375 feet of boarded fence and 2,600 feet rail and post fence have been erected, 75 trees planted, besides sewer, tar-paving and road-work, it must be conceded that the transference of these ditch-lined meadows has been very rapid.

The Mayor (Councillor C. Goddard Clarke, J.P., L.C.C.), in the presence of the borough engineer and other officials, having drove to the boundary road fences, and along the several new roads and declared these thoroughfares open to the public for ever, the fences were thereupon removed, and this important improvement, which has been so heartily desired by the surrounding inhabitants for many years past, was completed.

The illustration shows the class of dwellings it is proposed to erect.

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.

AN ORDINARY meeting of the Council was held at the Institute rooms, 20 Lincoln Place, last week. Mr. William Mitchell, R.H.A., in the absence of the President, occupied the chair.

There were also present Mr. C. J. McCarthy, Mr. R. Caulfield Orpen, Mr. F. G. Hicks, Mr. W. K. Parry, hon. secretary.

The Hon. Secretary brought before the meeting a letter he had received in his private capacity from the clerk of the Bray Urban District Council, in reference to the forthcoming appointment of an architect in connection with the scheme of the Council under the Housing of the Working Classes Act.

The Hon. Secretary submitted to the Council the letter he had written in reply, which letter the Council approved.

The following is a copy of the letter:—

"December 29, 1902.

"M'Donnell, Esq.,

"Clerk of the Bray Urban District Council,

"Town Hall, Bray.

"Dear Sir,—A copy of your circular on the subject of the appointment of an architect for your Council has reached me. I am writing to you in my official capacity as honorary secretary of the Royal Institute of the Architects of Ireland, to express the hope that in making an appointment your Board will give a preference to candidates who are members of the Institute.

"I may point out to you that membership of our Institute is in itself a guarantee both as regards the character and qualifications of the architect.

"Almost all the responsible and qualified architects in Ireland belong to our Institute, and it is very much in the interests of the ratepayers that your professional adviser should be a member of a recognised body of architects.

"When the Dublin Corporation were making the appointment of city architect some years ago, they took this matter into consideration, and they elected the present city architect, Mr. McCarthy, who was and is still a prominent and distinguished member of our Institute.

"I enclose for the information of your Council the list of members for 1902, and I beg to remain, yours obediently,

"W. KAYE PARRY, Hon. Secretary."

Several accounts submitted by the Hon. Treasurer were officially passed by the Council.

This being the first regular Council meeting of the year the following gentlemen were appointed to form the standing committees:—

The Professional Practice Committee.—Mr. Batchelor, Mr. Owen and Mr. Orpen.

The Arts Committee.—Sir Thomas Drew, Mr. Mitchell, Mr. Hicks.

The Publication Committee.—Mr. A. E. Murray, Mr. Rawson Carroll and Mr. C. McCarthy.

TESSERÆ.

Precision in Greek Art.

FROM its first dawn to its last flickering gleams, one prevailing characteristic is observable in Greek art, namely, precision and completeness of execution. It is a mistake to suppose that beauty was the primary motive which influenced the Greek sculptor; indeed, beauty as an influence, whether it be in Pagan or Christian art, holds only a place of secondary importance; it is an effect not a cause. The æsthetic feeling, the desire to beautify, is, of course, the source of all art, whether it displays itself in the adornment of a savage's war-club or of the Temple of Pallas Athené. The first motive of the artist is imitation—truth of representation. The Greek, as has been truly said, thought in form; it was the habit of his mind to invest the phenomena of nature and abstract conceptions with a human form. With this was joined an innate love of precision and completeness. He was the best workman the world has seen, the Japanese, perhaps, running him rather closely in the race. His faultless skill of hand showed itself in everything it touched, whether he was carving the spiral curves of an Ionic capital or the wavy locks of Cythera's hair. He was surrounded by the most beautiful men and women in the world, whilst the absence of any feeling of shame attached to nudity and the constant practice in the gymnasium and the public exhibition of athletic sports gave him ample opportunities for observation and study. His favourite motto of "Nothing too much," inscribed on the gates of the Delphian temple, shows what importance he attached to the realisation of his aim and the subordination of parts to a whole. The ideas of grace and beauty came to him as a natural result, but they are not by any means a prevailing characteristic. The aim of Phidias was an ideal grandeur; he imparted to his figures a more than human nobility of

aspect, and his execution shows the happiest possible medium between the harsh and rigid insistency of form which marks his predecessors, and the softer and more sensuous rendering of later schools. In the miserably insufficient terminology in which language tries to convey ideas received through the eye the word "repose" has become conventionalised as descriptive of one of the greatest qualities of plastic and pictorial art; it is meant to convey that enduring, time-defying look which we see in great works of art, which exalts the imagination above the object it is contemplating.

Cathedral of Trent.

The Duomo is small but very solemn Romanesque, begun in 1022, finished in 1128 and with a new choir in 1205. The apse is round-ended, and contains an episcopal throne; the stalls are in the choir, and the high altar, under a baldachin, is westward of them under the lantern. In the middle of the choir is a huge lectern. The aisles are very lofty and vaulted; there is no triforium and a very small clerestory. The windows throughout are small, but very deeply recessed and finely moulded, and the interior abounds in strong contrasted effects of light and shade. The shafts are cylindrical, with bases almost purely Attic, upon a square plinth, with a kind of tongue overlapping at each angle. The caps have stiff flowers, rather like our Transitional, round the bell under a well-moulded abacus. A curious arrangement is that the stairs mounting to the roofs are visible, being arcaded in the side walls north and south of the aisles. There are a great many perishing frescoes in all parts. The nave has open seats, some of which are fixed to the face of the pulpit, which is against a pillar on the south side. Externally, there is a fine west door and a thin arcade on the outer walls. Round the apse and choir and transepts runs an external gallery. East of the south transept there is a regular Italian porch, namely, a gabled archway projecting from the wall and resting on shafts, which have their bases standing on grotesque beasts or else on a dwarf wall. Here the beasts are lions. The shafts, which are double, often, as here, are knotted together half-way up; a very unsatisfactory conceit in such a material as stone. A small round apse, panelled externally, also projects from the east wall of the south transept. There is a crypt under the choir. A small octagonal lantern surmounts the crossing.

The Ancestral Images of the Romans.

In his chapter entitled "Honos Imaginum"—the honour attached to portraits—Pliny says it was the custom of the Romans to adorn their palæstra and anointing-rooms with the portraits of athletes and to carry about on their persons the face of Epicurus, and that they also prized the portraits of strangers, and afterwards contrasting the habit of the Romans of his own day with those of the ancient Romans, he says:—"And since the former have no longer in them any likeness to the minds of their ancestors, they also neglect the likeness of their bodies. How different it was," he continues, "with our ancestors, who placed in their atria to be gazed at these *imagines* and not statues by foreign artists in brass or marble, and kept coloured portraits of their faces, each in its separate case, to serve as *imagines* to accompany their funerals." It would seem from this that, besides the draped images or effigies in the halls, modelled and coloured busts of others of the family, probably of less distinction, were also kept to be dressed up on occasion, made into effigies, and carried in procession. Other *imagines* of the most distinguished personages in the family were placed outside at the threshold of the house, hung with the spoils of the enemy. It is of these *expressi cera vultus* and these *imagines* kept by the Romans as proofs of their nobility, and on which their pedigrees were inscribed, that Ovid speaks when he says, "*Perlege dispositas generosa per atria ceras.*" On the sale of the house they were not allowed to be destroyed or removed, but passed with it and were bought by *novi homines* (men of no family), and passed off by them as the portraits of their own ancestors—just as the portraits of Wardour Street are at the present day. Nor were the Romans singular in this custom of draping figures with real stuffs. The images of the gods in early Greece were also draped and dressed in clothes, and crowns were placed on their heads. They also had false hair which was dressed regularly by attendants, and at stated times they were washed and adorned with jewels and had their dresses arranged just as if they were alive. In later times this custom died out, but the colossal Athena's solid drapery of gold was washed at a certain festival appointed for the purpose, called *Plyntheria*. In Rome, however, the custom was maintained to a late day. The images of the temples were adorned with real drapery, and purple mantles were hung on the statues of the emperors. The Greeks, however, did not thus treat their portrait statues, and in this the Romans were peculiar. The Roman *imagines* and *cera* were probably executed in plaster or some such material, certainly not in marble, or otherwise they would have been too heavy to be carried about in procession.

NOTES AND COMMENTS.

WHEN M. ROYBET exhibited his *Propos Galants*, an edacious cavalier in a long cloak making love to a woman who is plucking poultry, the humour was so irresistible and the painting so skilled, the médaille d'honneur was awarded to him. It is a work which is often referred to, as if its appearance formed an event in the history of French art. A large etching by M. MILIUS from the painting is presented to all subscribers to *L'Art*, and at this season no more valuable work has appeared in Paris. The periodical, apart from that attraction, has much to interest its readers. An article by M. HENRY CHENNEVIÈRES on HORACE VERNET as a caricaturist gives a new revelation of the military painter's skill. Having architects for friends, he was not afraid to use them as subjects. FONTAINE, who is now a classic, is seen in his studio, while one of his assistants is engaged in sawing through a series of frames, inscribed Musée de Versailles, Musées Royaux, Musée du Luxembourg. HUYOT appears outside a tobacconist's, VAUDOVER and LE BAS are seated at tables. SPONTINI, the composer, and other great men are utilised. There are also articles on the Strasbourg Museum, BERNARD PALISSY, French art in the United States, and a profusion of illustrations, besides a coloured etching.

"PERROT and CHIPIEZ" in the archæology of art correspond with "ERCKMANN-CHATRIAN" in fiction. The latter partnership was dissolved through a misunderstanding, death alone could sever the former. The volumes on "Art in Antiquity" have been a boon to many students, for they comprise all the discoveries derived from explorations up to the time of publication. M. GEORGES PERROT was the projector of the series, but, however learned in archæology, he knew there was a degree of knowledge which was only to be reached by a practical artist, and hence his invitation to the late CHARLES CHIPIEZ, the architect. At the last election of the Académie des Inscriptions the majority of votes were in favour of M. PERROT. From holding the presidency of that section he becomes president of the Institut for the present year. It cannot be said M. PERROT is an architect, but he comes so near one there will be satisfaction in the profession at his election.

MR. LOUIS FAGAN, who died suddenly in Florence on Monday last, was an amateur who was recognised as authoritative on some branches of fine art. During several years he served in the Department of Prints and Drawings under Mr. CARPENTER, Mr. REID and Mr. SIDNEY COLVIN. In that way he was able to render service to many inquirers. Ill health compelled him to resign. He was a protégé of Sir ANTONIO PANIZZI, and wrote a life of the famous chief librarian, besides editing the interesting correspondence which passed between PANIZZI and PROSPER MERIMÉE, the impeccable. He was sometimes sent on confidential missions to Italy. Mr. FAGAN was also the author of a "Handbook to the Department," a book on "Collectors' Marks," "The Art of Michel Angelo," &c. He contributed many articles to journals. The Italian language was as familiar to Mr. FAGAN as English, and he was often able by means of it to render assistance to friends in the Art Club.

ILLUSTRATIONS.

THE RETURN FROM THE DURBAR.

THE recent assembly of chiefs at Delhi was on many accounts one of the most remarkable pageants which can be witnessed on earth. As yet Western influence has not caused the substitution of the civil or Court costumes of Europe for the gorgeous robes made up of cloths of gold and silver which for so many ages have been worn by the native potentates of India. Costly materials can be afforded, for the labour in making them up is to be obtained at an insignificant price. "It is only in India," says a writer, "that patience, dexterity of manipulation, grace in designing, trustworthiness in handling gold and precious stones, and the skill which is the result of many years of application can be bought for threepence a day." There are signs that employment even at that rate will not be always awaiting craftsmen. While costume in the old style and which is in keeping with the architectural surroundings is not entirely superseded, opportunities for fine pictorial

subjects exist, and it is remarkable how few English painters have taken advantage of them. When occasionally Indian scenes are selected for pictures they suggest a timidity in utilising the splendour of the East. Mr. EDWIN LORD WEEKS, an American artist who has been a pupil of M. BONNAT, and who has long lived in Paris, has had the courage to utilise India, and the success of his paintings in the Salon is a testimony to the pleasure which they have given. His insight enables him to enter into the spirit of the various scenes, and in that way they have a naturalness which has been rarely attained by European artists in India.

THE TOWN HALL, COLCHESTER: GENERAL VIEW.

CATHEDRAL SERIES: WORCESTER.—THE CHOIR, LOOKING WEST.

HEAD OFFICES, NATIONAL MUTUAL LIFE ASSOCIATION OF AUSTRALASIA, LTD., MELBOURNE.

THE building shown in the illustration has been erected from the designs of Messrs. WRIGHT, REED & BEAVER, architects. The property has a frontage of 82 feet to Collins Street by a depth of 50 feet along Queen Street. The building is of Pymont freestone on subbase of polished granite, and the shafts to the entrance and windows are of marble. The general height is about 110 feet. The building is of fireproof construction throughout. The entrance in the centre of the Collins Street frontage opens into a hall 16 feet in width, finished in marble of different colours, and the ceiling is groined in masonry. The floor of the entrance-hall is of mosaic, with a design in the centre illustrative of the ramifications of the Association throughout the Empire. The floors of the other halls and corridors are paved with marble tiles, and the three lifts are situated at the end of the entrance hall with direct access from it. On the left of the entrance hall lies the Association's general office adjoining all necessary offices and strong-rooms, with additional strong-room and stationery-room below, and directly connected with them by a private stair. The fittings and furnishings of this portion of the building are of walnut, and the ceiling is panelled and enriched with beams carried on cluster shafts. On the right of the entrance hall is the Melbourne manager's room, loan department, &c. On the fifth and sixth floors are the board-room, the actuary's agency and correspondence departments. The other floors are divided into suites of offices, each provided with strong-rooms and efficiently ventilated and well lighted. The basement, the entrance to which is in the centre of the Queen Street front, contains, in addition to the portion to be used by the Association, suites of offices with strong-rooms, &c. Lavatory accommodation is provided on each floor, entirely disconnected from the other portions of the building. On the top floor are the caretaker's quarters, &c. The lighting is of gas and electric light throughout.

MUNICIPAL SCHOOL OF TECHNOLOGY, MANCHESTER.—VIEW ON PRINCIPAL STAIRCASE.

THERE is not a more complete example in this country of an industrial college than the group of buildings in Manchester designed by Messrs. SPALDING & CROSS, and carried out under the direction of Mr. A. W. S. CROSS. We published a view of the building on March 14, 1902, and now give an illustration of the principal staircase. This, like the other staircases and paving, was constructed by STUART'S GRANOLITHIC STONE COMPANY, LTD. The railing of the staircase, which is so effective a feature of the interior, as well as other examples of wrought-iron work, are creditable to the skill of Messrs. JOHN JONES & SONS, of Manchester. The constructional steelwork was entrusted to Messrs. DORMAN, LONG & CO. Messrs. KIRKPATRICK BROS. supplied the granite and Messrs. J. STEPHENSON & Co. the Tilberthwaite slates. The hydraulic lifts are by Messrs. R. WAYGOOD & CO., LTD. Messrs. EASTON & CO., LTD., constructed the electric lift, which is of the express coupled type with the patented cross-over sheave-gear. The patent glazing was executed by Messrs. HELLIWELL & CO., LTD. The furniture and fittings are by Messrs. GILLOW & CO. The cement was manufactured by the RUGBY PORTLAND CEMENT COMPANY. The STURTEVANT ENGINEERING COMPANY, LTD., carried out the heating and ventilation, including parts which had to be specially arranged. The windows, with typical figures, were produced by W. J. PEARCE, LTD. The general contractors were Messrs. R. NEILL & SONS.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER III. (continued.)

IN providing an argument, it is not amiss to try and anticipate criticism, by suggesting and demolishing contentious points. On this understanding another obvious criticism may be noted, namely, that buildings other than schools are to be met with possessing plenty of window-lighting, separate departments, plain and serviceable elevations, and (possibly) of only three storeys in height; and regarding playgrounds, seeing that in the case of schools this feature is frequently tucked out of sight of the street elevations, its presence or absence is powerfully discounted as affecting the argument; factories and warehouses may be cited as examples of buildings with somewhat similar requirements superficially.

In reply to the counter-argument, it may be at once conceded that there are elements of similarity, and that at times it is not easy to recognise from a casual glance for what purpose a building is destined, more particularly if looked at merely on paper, where it is detached from its actual surroundings, which tend so greatly to give the necessary local touch. This failure in discernment is, however, to be regarded more as a fault in the designer than in the original argument. To take a concrete example, a factory would usually be even more simply treated than a Board school; it would have a greater number of windows proportionately, and they would probably be disposed symmetrically both for economy and convenience; by preference they would be iron casements (a Board school might have wooden sash-windows), and a factory would also by preference have a flat roof for aid in case of fire, instead of the pitched roofs permissible in Board schools, whose well-planned and adequate staircases render unnecessary the aid of the roof as a means of escape from peril.

Warehouses would require loophole-framed doors for the passage of heavy goods to and from the different storeys. A typical warehouse is here shown (fig. 7). There is not

Elevation of a Warehouse (for perspective only)

FIG. 7.

the slightest intention to convey the idea that when a building is looked at, all, or indeed any of these points are consciously considered in any detail; it is the intuitive

Westminster Palace Hotel, London.

Architects: Ward & A. Moseley.

Elevation in Victoria Street

FIG. 8.

method employed for arriving at an apparently instantaneous deduction. And it will not do to strain any principles unduly; there are many buildings that express more or less successfully their *raison d'être*: if more so, we may offer up hearty thanks; if less so, let us look for the good points that have produced partial success and for the external influences that have checked its consummation. Westminster Palace Hotel, London (fig. 8), and the Market House, Bolton (fig. 9), are instances of successful expression, whilst the banking establishment at Leeds is an instance of partial success in this respect (see fig. 10).

Attention may be drawn in passing to those designers who, on occasions, tend to conceal expression of purpose of some structure by combining in one design two or more buildings variously destined. One example of recent date may be cited, designed by the late CHARLES J. PHIPPS.

Yorkshire Banking Co. Leeds:

W. W. Gwyther, Architect.

FIG. 10.

This block consists of Her Majesty's Theatre, with the Carlton Hotel, situated in Haymarket, London. An hotel and a theatre have totally different requirements, and should

be accordingly differentiated in treatment. Which of these two classes did the architect intend the block to suggest or to express? As an hotel, it makes a really fine block, and the artistic treatment would have been to define, and even to accentuate, the difference between the two buildings.

The same principle should be observed internally and externally. A scheme of plastic and pictile decoration

how can it be expected that a type so happily expressive of a temple to some divinity, with its very limited significance and its simple plan, shall answer for municipal buildings, as at Birmingham, with requirements so different and so varied? Or how can it be expected that the same type shall be suitable for a sacred temple and for a secular hall, such as St. George's, Liverpool?

FIG. 9.—MARKET HOUSE AT BOLTON, LANCASHIRE. [G. T. Robinson, Architect.]

that would set off and be appropriate to a theatre would be utterly destructive of the best interests of an ecclesiastical building; in the latter it is requisite that everything shall harmonise (preferably in a minor key), and shall not provide anything distracting to the one object that should draw people to the building; whereas in a theatre a brighter, more playful and more varied treatment is in accord, and provides the wherewithal the public may while away the intervals in the stage performances; and, moreover, the use of these buildings solely in conjunction with artificial light justifies and, indeed, demands the brighter treatment. Not that brilliant colouring has not often been used in ecclesiastical buildings, and doubtless with success in more favoured and sunny climes than the United Kingdom, where the scale of comparison is altogether in a brighter key.

It is permissible to recall an amusing incident in connection with a scheme of colour decoration prepared for a place of worship by the present writer. The only adverse comment heard (and that indirectly) amidst a chorus of gratified approval was that the ladies' complexions had not been studied in executing the scheme. This was quite true, so far as allowing the consideration to interfere with the proper scheme was concerned, and the writer cheerfully admits it, though it is necessary to remember that there should not be any wilful disregard of such a point. The above veracious anecdote may be rounded off by stating that not one lady has so far been found to tax the architect directly with this "defect," nor as a matter of fact has there been any disastrous result to the complexion, as alleged.

It would be easy, but profitless, to multiply instances of successful or unsuccessful elevations in regard to expression; but before leaving the point attention may be drawn to the fact that certain assemblages of features have obtained (either by original sympathetic adaptation or by prescriptive right) a definite character, and this character should not be lightly used as a cloak for buildings of other purport. Consider, for example, the following:—The Greeks and Romans, in order to obtain certain effects for specific purposes, accustomed themselves and their successors for fifteen hundred years or so to recognise, as a temple sacred to one or other of their divinities, an edifice bedecked with columns suitably disposed around a simply planned chamber (or chambers); the elevations emphasised the plan, even if not expressing the purpose, and, granting that the latter remark may hold good, it is certainly the fact also that, as a rule, there is not anything against the spirit of the building, in the type of design, which the Greeks brought to such perfection. This being the case,

In expressing the nature of a building, it is to be borne in mind that it is not settled at all by the plans, which may indeed be correct to the utmost and yet have in conjunction absolutely unsuitable elevations. Consider such a façade-plan as shown in the accompanying fig. 11, and let it be granted for the sake of the argument that it is correct for the front of a prison, with windows, &c., all as shown. (It may, however, be remarked in parenthesis, that it would not be likely to satisfy Home Office require-

Hypothetical Façade Plan of Prison

FIG. 11.

ments.) An elevation such as is shown in fig. 12 would be eminently suitable as expressing the nature of the building; on the other hand, such an elevation as shown

FIG. 12.—SUITABLE FAÇADE FOR PRISON.

in fig. 13 would be most inappropriate. These are merely given to illustrate how the same plan can receive entirely right or entirely wrong treatment in elevation. To sum up, the principle to be remembered carefully is to give full effect to the most salient characteristics of a building. (See Appendix A.)

Both the previous elevations, however, emphasise the plan shown, and this principle of *Emphasis* will now be considered. The slightly projecting wings are not a necessity, but they serve to give character and to show that there is not only a different use for the end portions from

that to which the central portion is devoted, but also that there is a similarity of use for the two ends.

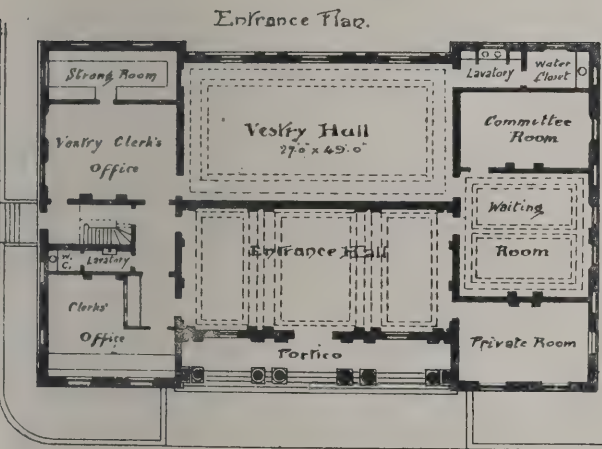

FIG. 13.—UNSUITABLE ELEVATION FOR PRISON.

In passing, Paddington Vestry Hall, London (fig. 14), as originally built, is illustrated as a good example of emphasis of plan.

Vestry Hall, Paddington, London.
James Lockyer is Architect.

Front Elevation.

HARROW ROAD
FIG. 14.

Let it now be supposed that an upper storey is required for similar purposes as on the entrance floor—but in this instance, the building not necessarily a gaol—then

FIG. 15.—FAILURE TO INTERPRET THE PLAN.

the elevations in the previous figures, adequately raised on the same lines, would equally well emphasise the plan. If, however, an elevation as shown in fig. 15 were used, the plan would not be interpreted—the motif would be utterly

destroyed. But if the upper floor were destined for one purpose throughout, the union of façade would be justified. With the plan given above it would be easy to give emphasis, the façade being symmetrical and simple in character. But a very different type might be met with, for instance, an outline such as is shown in fig. 16; it is

Façade Plan of Irregular Outline
FIG. 16.

still requisite to emphasise the plan, but satisfactory treatment may demand greater consideration than in the previous case. The elevation shown in fig. 17 satisfies the

Elevation emphasizing previous Plan.
FIG. 17.

demands both of emphasis and balance (the latter quality will be dealt with later in the series). It may be argued that, at a first glance, it is not clear how a plan of this out

Elevation failing to emphasize previous Plan.
FIG. 18.

line should be treated in elevation in any way that would fail to emphasise it; but it would be feasible, though undesirable, to produce such an elevation as is shown in fig. 18. All the character of the plan would be overlaid by such treatment, the projecting room on the one side being made of no more account than the mere bay window on the other.

(To be continued.)

Messrs. Dorman, Long & Co., Ltd., of Middlesbrough, have issued this year a diary, calendar, book of tables, and a cash-book united, which from being printed on india paper can be placed in the pocket of a coat without causing a protuberance. It is well bound in leather, and will serve as a useful companion and guide to those who, as the poet says, "meddle with cold iron."

THE KING'S SANATORIUM.

IN the *Lancet* of last week the three essays and plans which gained the prizes in the competition for the erection of a Sanatorium for Tuberculosis are published. Three prizes of 500*l.*, 200*l.* and 100*l.* respectively were awarded as follows:—

First Prize:—Motto: "Give him air; he'll straight be well." Dr. Arthur Latham (London), with whom was associated as architect Mr. William West (London).

Second Prize:—Motto: "If preventable, why not prevented?" Dr. F. J. Wethered (London), with whom were associated as architects Messrs. Law & Allen (London).

Third Prize:—Motto: "Vis medicatrix naturæ." Dr. E. C. Morland (Croydon), with whom was associated as architect Mr. G. Morland (Croydon).

Honourably Mentioned:—(a) "Fac Recte, nil time." Dr. P. S. Hichens (Northampton), with whom was associated as architect Mr. R. W. Schultz (London). (b) "Open air everywhere." Dr. Turban (Davos), with whom was associated as architect Herr J. Gros (Zürich). (c) "Honestam quam magna." Dr. Jane Walker (London), with whom were associated as architects Messrs. Smith & Brewer (London). (d) "Humus." Dr. J. P. Wills (Bexhill), with whom was associated as architect Mr. Wills (London).

In the first prize essay the following conclusions are arrived at:—

The buildings of a sanatorium must, as we have said, be so constructed that the atmosphere within them rivals the outside air in point of purity. For example, the smell of cooking destroys the appetite of an invalid while fresh air stimulates it, consequently great pains must be taken to shut off completely the dining and kitchen arrangements from the patients' rooms. Again, though it may be possible to keep a room where a single patient lies fairly free from impurity, the atmosphere of any room in which a number of people are gathered together for any length of time will certainly become more or less contaminated, and on this count alone it is obvious that the use of recreation-rooms or other places of assembly, such as churches, must be restricted within narrow limits. Finally the sanitation must be perfect and without flaw.

We are now in a position to say that in erecting a sanatorium arrangements should be made of such a kind that:—

1. The buildings are so situated, and of such a nature, that the formation of all dust is, as far as possible, avoided.

2. The dust, which inevitably collects, can be readily removed.

3. All infected material can be readily and effectually destroyed or disinfected.

4. The atmosphere of the buildings is free from all source of contamination, and rivals the outside air in point of purity.

5. The number of recreation-rooms and other places of assemblage is limited, and everything avoided which is calculated to tempt patients to stay in-doors.

In the course of the essay several objections are raised against the use of verandahs, one being that in the climate of England they block out too much light, unless the building is so arranged that they are placed before a basement or the interval between the storeys is much increased, both of which procedures lead to a large outlay without any compensating advantage. Verandahs are not easily kept clean, in the strict sense of the term, and in the nature of things cannot contain as pure an atmosphere as is found in the open, or even at the window of a room that contains only one person; further, they interfere with the privacy of patients confined to bed, and may disturb their rest, whilst in summer they sometimes tend to become insufferably hot.

The following summary is also given:—It is agreed that the accommodation for all patients must be comfortable, a separate room being provided for each; that the sanatorium should be on an elevated and sloping site with a sunny exposure and well sheltered from cold winds; that it should have a farm at a convenient distance, be surrounded by extensive grounds, well wooded and affording ample space for exercises of various kinds; that the soil should be dry and permeable and the water-supply abundant; and that it must be fitted with the latest sanitary arrangements and equipped with all requirements for scientific research. In addition we have shown in the preceding pages that:—

1. The ventilation should be such that the air contained within the rooms and passages is free from all sources of contamination and rivals the outside air in point of purity, whilst at the same time draughts are not encouraged.

2. The buildings should be so situated and of such a kind that dust is as far as possible avoided.

3. The buildings and the fittings should be of such a kind that such dust which inevitably collects can be readily removed.

4. Arrangements should be made for the ready and effectual destruction or disinfection of all infected material.

5. The buildings should be of such a nature that constant medical supervision can be readily exercised.

6. The doctor's quarters should, as far as possible, overlook the grounds.

7. The bedrooms of the sexes should, as far as possible, be in different blocks, but there is no necessity for separating the men and women in the dining-room or grounds.

8. Four classes of patients must be provided for both in the sanatorium and in the grounds:—(a) Those who can take exercise more or less freely; (b) those who can only take slight exercise on level ground; (c) those who must be isolated in their own rooms; (d) those who, though unable to take exercise, may be allowed to associate with a few other patients.

9. The accommodation for visitors must be limited.

10. No provision, so far as the buildings are concerned, need be made for amusements beyond an entertainment-room which may also serve the purposes of a library.

11. No provision should be made for games, such as billiards, golf and tennis, which involve much movement of the arms or lead to excitement.

12. A few open-air galleries are of service, but nothing approaching the Liegehalle system should be erected.

13. The dining-room and kitchen should be completely cut off from the patients' rooms, but no separate dining-room need be provided for the medical staff.

14. The kitchen arrangements should be of the most modern type and thoroughly sanitary.

15. The dairy and the farm should be of a model character.

16. There should be ample accommodation for hydrotherapeutic measures.

17. Adequate arrangements should be made for drying clothes.

18. The heating arrangements should be such that the temperature is never raised more than a few degrees above the outside temperature, so that no sudden variations are experienced when the patient leaves his room, and that the humidity of the air is not sensibly diminished.

19. Adequate shelter should be provided in the grounds and elsewhere against wind, excessive sun, or heavy rain.

20. No special arrangements need be made for exercise under cover in bad weather, though it is as well to provide covered ways between certain of the different buildings.

21. All facilities should be provided for the treatment and clinical observation of the patients by the aid of laboratories and special departments.

22. The facilities which should be provided for research include more especially facilities for observations in bacteriology and pathology, chemistry, physiology and meteorology.

The block plans show provision for eighty-eight male and female patients. There is a central administrative block, with corridors and rooms for patients at right angles for about 150 feet at each side and then trending at an obtuse angle. Only two storeys are recommended, both on account of the economy of service and the inability of patients to ascend many stairs, the amount of work done in raising the body vertically being equal to twenty times that expended in moving the body on level ground; or, in other words, five storeys or 60 feet is equivalent to a walk of 1,200 feet on level ground. In order to diminish noise it is suggested that floors should rest on steel girders laid on felt and filled in with concrete, the partitions being of cement. As little wood as possible should be used. The roof should be flat and asphalted. Rooms on ground floor should be raised about 4 feet above the ground on the higher side to insure the privacy of the bedroom. The floors of bedrooms should be of teak, with the joists well plugged and laid on cement. Zinc ceilings placed directly on the under side of the girders and fixed on a cement bed are recommended. The stairs should be of teak. The windows are to be carried flush with the ceiling, to be opened without effort, and not to clatter in the wind. The dimensions of bedrooms should be 10 feet high, 12 feet broad and 14 feet deep. As regards cost, it is said:—

It is impossible to give any definite statement as to the cost of the proposed scheme without knowing the cost of labour and of materials at the chosen site and other details. Many sanatoriums have been built for the poor at a cost of from 250*l.* to 300*l.* a bed, but modern sanatoriums, which contain single-bedded rooms and are constructed with a view to comfort, are more expensive. Thus, the Hohenhonnef, which consists of one large block and accommodates 109 patients, cost 660*l.* a bed; the Anstalt, at Nordrach Colonie, for 24 patients, which is usually held up as an example of cheapness, cost 500*l.* per bed; the projected sanatorium at Manchester (100 patients) is expected to cost 1,000*l.* per bed; and the projected Brompton Sanatorium at Frimley for 100 beds in one large block is to cost 56,000*l.*, whilst the most recent fever hospitals in England, hospitals which have as many as 20 patients in a ward, cost from 500*l.* to 550*l.* a patient.

The plan adopted in the second essay is a central building with two-storey segmental wings, arranged in the form of a curve so as to afford a certain amount of shelter without interfering with the south aspect, the total frontage of the building being about 700 feet. In front are placed deep verandahs.

The sanitary annexes are placed at the back of the wings facing the entrances from the grounds, which are in the centre

of the wings. The administrative block and kitchen offices are placed on the north side, centrally situated and connected directly to the main building by a corridor. The approach is from the north, whilst the laundry, engine-house and investigation buildings are arranged on a supposititious plan, and have been placed within easy distance.

The authors of the third essay say:—The ideal sanatorium consists of a series of isolated huts, with windows on all four sides, in which the patients spend their whole time except when they are actually out in the grounds; here they sleep and have their meals, breathing the while an atmosphere beyond the risk of contamination. On a small scale this appears to be practicable; but for a sanatorium of 100 beds the difficulties of heating, of carrying meals and of supervision over so large an area render the scheme impossible, with due regard to economy. The chief problem, then, is to effect a compromise whereby each patient's room obtains a maximum of sunshine and fresh air and yet is so placed as to insure economy of management. Hence the unit of our sanatorium is a room facing south, with unobstructed aspect, with a large window space, with a door on the north side opening on to a wide corridor in which there is a large window exactly opposite the door. These rooms occupy the whole south frontage, and everything else has been made subservient to the one essential of providing that a current of pure air shall constantly flow through them.

Each of the essays treats in detail, not only of the construction of the buildings, but of the furnishing, ventilation, drainage, as well as the administration. Nor are the arrangement and management of the farm and adjoining land neglected. The essays form treatises on sanatoria, and architects as well as physicians are indebted to the *Lancet* for enabling so much information on an important subject to be obtainable.

GEORGE WASHINGTON'S BUILDING LAWS.

ACCORDING to a paper by Mr. Snowden Ashford, inspector of buildings at Washington, the father of his country, took personal concern to make the national capital, or federal city, a model in every particular.

The plan of the city was entrusted to L'Enfant and Elliott, and after the broad streets and avenues were laid out Washington, with the wonderful forethought that characterised his public life, directed the Commissioners in 1791—while the capital was still in Philadelphia—to prepare the deeds transferring the property outside of the lines of the streets and reservations back to the owners or proprietors. There was a beautifully planned city on paper, and in keeping with the broadness and proportion of the plan Washington foresaw the necessity of regularity, permanency and safety of the buildings and improvements destined to flank the broad thoroughfares of his ideal city. He therefore directed that the trustees or commissioners insert such terms and conditions under and upon which conformed the first building regulations that govern the construction of buildings to this day, although formulated by George Washington on October 17, 1791—more than one hundred years ago.

Think of starting a city with a perfect system of streets, and with building regulations to govern for more than a hundred years, and think of the man who, amid the cares of state in Philadelphia, still had time to direct the manner of building the houses in his embryo capital. Some of George Washington's regulations show how much thought he gave to the plan of his city.

First, "The outer walls of all houses shall be built of brick or stone." Who would have thought 100 years ago of building steel or iron buildings or of concrete walls? And yet even such buildings come within the intent of this first regulation, and our present regulations repeat this requirement.

Second, "That all buildings on the streets shall be parallel thereto, but before the foundation or party wall shall be begun application must be made to the proper person appointed to superintend buildings to ascertain lines of the walls." The wisdom of this requirement is recognised by our present regulations, but seems to have been neglected for a long time, and as a result, buildings erected more than twenty years ago are in some instances one foot on the neighbouring lot, or in many cases in mind nearly 1½ feet in the public street.

The next, or third, regulation relates to the maximum and minimum height of buildings, and provides that no building shall be less than 35 feet in height on any avenue. But the terms of this article were declared suspended by proclamation of President Monroe about twenty years after the death of George Washington, and the height of buildings is now regulated by Act of Congress approved by President McKinley March 1, 1899.

The fourth regulation related to party walls and the method of locating and paying for same, and is in force to-day in the same terms as drawn up by Washington. He also realised the necessity for temporary buildings for convenience

of workmen while erecting buildings, and provided them a now regulated and permitted.

His sixth regulation related to the manner of building over alleys, which at that time were private property, but as most of the alleys are now public, so much of the regulation is seldom applied.

The other regulations adopted under Washington's directions applied to projections beyond the building line, such as vaults, areas, cellar doors and eaves of houses, and the limitations are similarly enforced to-day.

So it will be seen that the father of his country laid the basis of regulations which have been amplified and enlarged upon by Presidents Monroe and Polk, extended by the Board of Aldermen and Board of Common Council, with the approval of the President, increased in scope by Acts of Congress, and amended and revised by the Commissioners of the district under special authority of Congress; but to this very day they are the same in intent as the regulations of George Washington, expanded only to meet the changed conditions of 111 years.

A JESUIT ON BUILDING WORKMEN.

THE Order of the Jesuits have always taken an interest in architecture and the sciences and arts relating to it. There have been several amateur architects among the members, and a style was at one time adopted in the churches which was in part their creation. As missionaries they have to build churches and schools in districts where skilled labour is not always to be obtained. In this country they are satisfied with giving commissions and acting as observers. A gymnasium and other building works were lately in progress at the Jesuit College, near Chesterfield, and the following good-humoured remarks in the *Mountaineer* reveal what was thought of the workmen and their manner of labour:—

This term has afforded us an opportunity of studying the British workman on his native scaffolding. We have watched the new wing and the gymnasium rising from the ground not without some curious speculation as to when they would attain to their full growth. The more sanguine among us have professed a cheery optimism, and have predicted the speedy completion of both edifices in not more than three times the period specified in the contract. Others have been heard to mutter something about "Easter," or "Wait till the summer." But the unprejudiced spectator prescinds from such practical considerations as completion, or the proportion of the product to the time of production, and prefers to study the mind and methods of the producer.

And first, the British workman presents himself to him as an interesting type of eternity, inasmuch as he can never be said properly to have begun, he appears to be independent of the passage of time and he shows no signs of ever coming to an end. He is amiable and not at all shy. He courts investigation, and is never better pleased than when he is being questioned about his occupation. For this affords him an opportunity, first, of doing a little less work than he might otherwise have done; and, secondly, of throwing dust in the eyes of his questioner, who goes away honestly believing that the bricklayer is indeed laying bricks and the stonecutter really and truly cutting stones.

He guides himself by several sound maxims, the first of which, though he doesn't know it, is classical—"Ne sutor ultra crepidam." It is an unwritten law with him and his fellows (perhaps, though, it is written) that each workman shall keep rigidly and exclusively to his own department of work. A stonecutter may look at a brick, but he mustn't touch it; a bricklayer may have a general sort of notion that there are stones about, but he mustn't say so. The carpenter affects not to know that chisels are also used by masons, while the "labourer" (there is a subtle distinction in the word) carries his hod of mortar up the ladder, and is quite surprised to see it used by the builder. As for the man who mixes the mortar, he doesn't know why he does it. As each labourer comes and fills his hod he thinks to himself, "How funny. Now what is he going to do with it, I wonder? I shan't have any left soon if they go on like this."

If the bricklayer comes to a spot in his course at which a stone ought to be laid, he sits down and waits till the mason comes and lays it. If the mason comes, very good; if he does not, all the better. There is a lovable simplicity in all this which quite disarms the contractor, and often throws a spell over his employer.

Another golden maxim of the British workman's is, "Do as little as you can, and take your time about it." He does not say this in so many words, for he is often a married man and frequents only the best public-houses; but he acts upon it all the same. This leads him to scorn piecework, and to give his whole attention to that which is paid by the hour. And what his "whole attention" is, we all know. When the British workman gives his "whole attention" to anything, sensible

people who are not British workmen go away and wait until his attention is diverted into some other channel. They know that when once he begins to think about his work they are lost, for his reflections naturally take the form of self-examination and he asks himself, "Am I really doing as little as I can? Am I honestly taking as long about it as possible? When it is finished can I, without affectation, tell myself that it is as badly done as even I could do it?" And if he finds himself at fault on any of these points his duty to himself compels him to begin all over again.

A third aphorism which serves the British workman as a guide to his feet is, "You can't do two things at once." Some, indeed, hold that this proposition involves the corollary that "You can't do anything at once." Most workmen, however, distinguish; they make an exception in the case of ceasing work, they say that this can and ought to be done at once. Thus the foreman never has to whistle twice, nor the clock to strike in vain. But all agree that a man can't smoke and work at the same time:—"In justice to our employer," they say, "we won't attempt it." So when a bricklayer wants a smoke (and he generally does) he knocks off bricklaying and smokes. If a stonecutter lights his pipe while he is at work and finds that the smoke gets in his eyes and hampers him, he recognises at once that he is attempting too much, so he leaves off stone-cutting and has his smoke out.

Sometimes there are, in addition to the ordinary workmen, two officials who are humorously described as the clerk of the works and the foreman builder. The duty of the first is to look on and smoke, and of the second to smoke and look on. Their work does not of course interfere with an occasional nap over a newspaper, but on the whole they succeed in doing it pretty thoroughly.

The slater, whose calling, like most occupations of a lofty character, has often to be pursued in solitude, sometimes feels lonely; and on these occasions the good-natured fellow will make no difficulty of descending and mixing freely with his fellow-workers on a lower level. He will lend a hand to the clerk of the works or the foreman builder, or engage in a friendly chat with the plumber, who, having taken only three weeks to lay two gas-pipes, and having twenty-six more to lay, of course has plenty of time on his hands.

This is not the place in which to speak of plumbers. That subject would require a treatise to itself; and besides, we have not yet been granted sufficient opportunity of watching them at their work. This much, however, we may say, as the result of former observation: if there be anywhere a piece of piping which is obviously too long or too short for his purpose, that is the piece of piping which the plumber will inevitably choose for it; if there be a wall, or a floor, through which, by going completely out of his way, he can knock a hole four times too large for the insertion of an utterly unnecessary pipe through that wall or that floor the plumber will at once proceed to knock such a hole.

Matthew Arnold said of the sea that it was "salt" and "estranging," and so far he may be held to have abused that element. But to these adjectives he prefixed the word "unplumbed":—

"The unplumbed, salt, estranging sea."

And this epithet alone quite removes the reproach implied in the other two, and makes the sea at once pleasant and desirable.

But let the British workman go on; let him proceed on his artless way; we are at his mercy. Until we are able to purchase houses ready-made in America and set them up for ourselves we must remain bound to the wheels of his chariot or hang ourselves in our own purse-strings.

THE SOCIETY OF ARCHITECTS.

THE following students' competition has been arranged:—

A cottage hospital, with wards for men, women and accidents; each ward to contain three beds. Bath-rooms, lavatories and earth-closets to be provided. Waiting-room, surgery, nurse's sitting and bedroom, bath, lavatory and earth-closet. Kitchen, scullery and usual offices, and two servants' bedrooms. All the accommodation to be on the ground floor, except the servants' bedrooms, which may be on first floor (partly in roof if necessary). A detached mortuary to be provided. The site, which is level and raised 3 feet above roadway, has a frontage of 70 feet north to south and 250 feet west to east, the building line being set back 20 feet. There is a building on the north boundary with ancient lights up a height of 10 feet from the ground level, and 6 feet in width, the building being 40 feet deep. Water supply from main in roadway, and provision to be made for storing and using rain water, and for disposal of waste water from baths and sinks, &c. Materials, brick with stone dressings and tiled roofs. Cost not to exceed 2,000*l.*, including boundary walls.

Drawings to be executed in ink to a scale of 8 inches to

1 foot, with one sheet of details of roof construction and a sketch perspective. Approximate cost to be stated and method of obtaining same shown. Block plan to a scale of 16 feet to 1 inch, showing drainage and having true north point indicated thereon. Drawings must bear no distinguishing mark, but have attached thereto a sealed envelope containing the author's name and address, and must be delivered to the Secretary on or before March 19, 1903. Drawings must be sent flat. A student who is in arrear with his subscription is ineligible to compete. The award will consist of books or instruments to the value of 3*l.* 3*s.*, to be selected by the successful competitor. The Council may give additional awards or withhold the prize in accordance with the number and merit of the designs received.

THE LOMBARD STREET SIGNS.

IN a letter to the *Times* Sir George Birdwood writes:—As the readers of the *Times* are aware, one of the happiest features of the decoration of the streets of London for the Coronation was the revival in Lombard Street of some of the picturesque signs of the older banking houses and goldsmiths' shops of the City. There was a wealth of artistic decorations to be discovered in the streets by the discriminating spectator during the Coronation, but they were, for the most part, isolated and overwhelmed by the monstrosities about them, and therefore ineffective. Even where an attempt was made to decorate a street or a parish on some co-operative and locally relevant plan, through the manipulation of it in so many cases having been left in the hands of men who were not professional artists, the failure to achieve a creditable result was just as marked and far more humiliating. The rare success of Lombard Street is mainly due to the fact that its famous banking and insurance houses intelligently, liberally and zealously combined to decorate it as a whole—their notion being to restore to it something of the quaint and significant picturesqueness of its aspect in the eighteenth century; and that they then entrusted the fashioning forth of their "fair idea" to so accomplished and sympathetic an "artificer in brass and iron" as Mr. J. Starkie-Gardner. It adds to the impressiveness of the *signa tabernaria* executed by him that they are not shams to serve a passing occasion, but realities, designed to minister, practically for ever, to the human sense of beauty, if not in Lombard Street, still as treasured examples of nineteenth-century work in truly architectonic street signs. Each one of them is racy of the locality, of artistic merit, and possessed of its own individuality; and all of us who take an "emulate pride" in the artistic evolution of modern London—which is advancing far more rapidly than some dream of in their patriotic pessimism—hoped that these signs would remain fixtures in Lombard Street, and, indeed, that the use of similar signs would gradually extend into all the pent and populous streets of ancient renown centred in the Bank, the Guildhall and St. Paul's.

After, however, some months of anxious suspense it is now again being said that they are all to come down, and that what appeared to be a lasting memorial of the Coronation is to be swept away in stolid defiance of the earnestly expressed wishes and protests of the banking and insurance houses most interested in the matter. These signs are not vulgar and offensive, because ignorant and selfish advertisements. They are the natural, spontaneous, correlative and concordant embellishments of a constricted, lofty-shadowed, public thoroughfare of inspiring and fruitful historic name. They do not impede either the perspective or the traffic of the street. On the contrary, they give to it that iridescent play of light and colour much needed in a street which, while architecturally dignified, is sombre, owing to its narrow course lying at right angles to the daily path of the sun and the almost complete absence from it of open shops, with their bright and gaily decked-out windows of broad ("plate") glass.

Surely it betrays a culpable default of public thrift that, when hundreds of thousands of pounds are spent on the adorning of our streets in connection with such State pageants as Jubilees and Coronations, no part of the expenditure should be devoted to decorations of a permanent character. Compared with Paris, Munich, Vienna and Rome, very little has been done for the artistic embellishment of the streets and squares and open places of London, which present innumerable situations where gates, arches, fountains, vases, obelisks, columns, statues, busts, wall trophies, &c., would most appropriately emphasise and exalt the surrounding architecture. The practice in Paris is to direct some substantial portion of all such occasional expenditures to the abiding benefit of the city; and the most beneficent application of it in the long result is found to be on buildings and monuments of the highest art, dedicated "to all the stories of the country." Napoleon I. was quick to recognise the part played by such memorials in giving to the French national character its distinctive note of passionate and unselfish heroism, first struck, with a resonance

that filled the whole world, in the noble tragedies of Corneille. The streets and parks of London, which of itself is a county, are the only schools, art galleries, libraries and recreation grounds of at least one-half of a population of 4,536,663 (Whitaker) human souls; and the duty of making these thoroughfares and open places stately and splendid, in illustration of all that is profitable in our history for instruction in righteousness and for perfection "unto all good works," is becoming one of increasingly imperative obligation on those who desire to maintain the traditional character of the people of London in its full integrity. This is why "City men" are instinctively so jealous for the worshipful care of their churches, and for the conservancy of every time-worn relic of the past and of every solitary green tree and every patch of old-time flowers surviving in their midst, the passing sight of which soothes and elevates them in the daily round of their exacting duties. Watching them where, in one or other of Wren's churches they so often seek a momentary refuge from the distractions of the street without, it would almost appear as if the ultimate and fundamental rule of art and religion must be one and indivisible. In its own degree, every work of art creates a sphere of untroubled mental repose about its beholders; and it is therefore, I would fain trust, in spite of the sinister rumours whispered about, that the Lombard Street signs may be yet spared to refresh for years to come the eyes and hearts of all wayfaring "City men."

TECHNICAL EDUCATION.

THE annual general meeting of the Association of Technical Institutions was held on Tuesday at Goldsmiths' Hall, when Sir J. Wolfe Barry delivered his presidential address. He observed that he had for more years than he liked to remember taken the greatest interest in many of the institutions devoted to technical education, and he was not likely to undervalue it. But one might, perhaps, in 1903, ask who did? Its value and importance to the country at large was in the air. One heard of it everywhere as the necessity of our time; and, again, it was common ground that in our scientific mental equipment we were behind our two great trading competitors, America and Germany. Why was this backwardness? It was not for want of information, it was not due to want of advocacy, it could not be owing to want of resources in the richest country in the world, and one which had produced the most original minds and some of the highest masters of applied science. In such an assembly as that one ought to recognise with thankfulness all that was done by the late Prince Consort to endeavour to show us that a main road to commercial success in the future lay through science and not by rule of thumb. Much progress had been made in the past fifty years; but, after all, could we, or ought we to be in the least satisfied with the present results? The matriculated students in German technical high schools numbered 15,442, while in the whole of similar institutions and universities of Great Britain the number of students was returned as 3,873. In America much the same contrast with us was apparent. We were, however, a practical nation, and when we were really satisfied we usually acted. It was many years after the commencement of the supposed peace millennium of 1851 before we thoroughly grasped the idea that a strong navy was absolutely necessary for our very existence as a nation, and that we were not loved on the Continent; but, once we felt sure of this, there was no more starving of our navy. The only danger with respect to the navy which a Government of Great Britain ran was that it should be suspected of neglecting it. If the public opinion of this country were as firmly convinced on technical education as that of Germany and America, there could not be that want of funds which we now sorrowfully recognised. What was wanted above all things was to convince our manufacturers of the extreme value of technical education.

He wanted, however, to use a word of caution against any exaggeration in the estimates of the influence of technical education on trade competition. It was of the greatest weight; but unquestionably there were other very important economic reasons for the great development of German and American commerce during the past twenty or thirty years. In the juxtaposition of coal and iron in this country we had for the first half of the nineteenth century an advantage over the other countries of the world who had not developed their mines or their means of internal communication. This condition of things existed no longer. Again, though we still were, he supposed, the richest nation in the world in accumulated capital, we in this respect occupied formerly a more commanding position than we did now. All our competitors, too, were Protectionist countries. He was not going to enter upon such a subject as Free Trade *versus* Protection; but it must be obvious that if manufacturers were secure in the possession of the home market they could afford to undercut in foreign ventures those who were not so happily placed. Another matter which had had of late an important influence in the competi-

tion of German and American trade with that of this country was standardisation. Both these countries recognised years ago its value, and characteristically set to work to bring it about. Some one might say that standardisation was a result of technical education, but he thought it was rather the result of practical business appreciation of the necessities of trade. He was happy to say that at last we were alive to the advantages of standardisation, and that before this year was out we should probably see it adopted in all the important engineering trades of Great Britain. One more matter affecting our trade might be referred to, namely, that owing to our long supremacy we had begun to look upon the trade of the world as almost our inherent right, and had not felt the present necessity of pushing it with zeal, intelligence and careful consideration of the real wants or tastes of our customers. This was, no doubt, in process of amendment. It was undoubted that all these matters should not be lost sight of or belittled when we discussed German or American competition with ourselves; and, as it was dangerous to overstate a case, he thought we ought to be careful not to appear to trace the whole or nearly the whole of the stress of the competition which we now encountered to the better technical education of our rivals. Perhaps this had been too much done. But in spite of well-grounded alarms our feet had not at present been very badly pinched by the shoes of the competition of other countries; the Board of Trade returns did not indicate—what we often heard of—the decadence of British trade. Up to now this country was holding its own, both in excellence of work and in its volume. He did not say that she would continue to do so, but, on the contrary, he recognised real dangers. He thought, however, that another main reason why we had been and still were backward in getting on equal terms with our competitors in matters within our control—for example, in technical education—was due to the fact that the sharp pinch of necessity had not yet absolutely come. That it would come, and come sharply, if we did not mend our ways he had little doubt.

He ventured to say that, first, we wanted to render available the highest intellects among us for research as applied to the arts, and, secondly, to discover and utilise the best possible directing minds in our manufactures. As a means to these ends we must educate widely. We wanted to see in Great Britain the man of science installed in his laboratory in most important manufactories, and encouraged to help in their developments. We desired to see in this country what was so observable in America, namely, that almost every one was a mechanic and knew something of applied science, valuing it, as was the case in Germany, as the handmaid of commerce apart from its inherent charm. We wanted to obtain our men at their best—when they were young, but not so young as to be without experience. Our object ought to be to turn out our best men fully equipped in every kind of scientific and practical education at from twenty-eight to thirty years of age, and then "to give them their head." A man like this would know when to discard obsolete methods, to get rid of wasteful machinery and still more wasteful hand or animal labour, and to march with the time—to walk with certainty and not haphazard. He wanted to suggest that our present methods required amendment. He ventured to think that we frequently endeavoured to produce the manufactured article of the educated man in technology at too early an age. This seemed to be the case from the lowest to the highest classes—we allowed children to go to work at 11 years of age, while Germany said 12, France 13, Switzerland 14 were the earliest legal ages. He noticed that the universal complaint among those who directed the technical studies of the artisan class was that they came to them deplorably deficient in primary education, and we could not be surprised that this was the case with an 11 years' limit at which parents could be tempted to earn money by their children's wages. Take, again, the youth leaving any of our public schools; how much had he learnt for the battle of life? He had spent some seven years in having Latin and Greek classics driven into him, generally with most indifferent success, and he had little or no knowledge of the classics of his own language. He knew very little of the geography or history of his own or any other country. He might know some mathematics of a rudimentary kind, if he had shown any taste that way and had had some encouragement. He knew no foreign language, and he scarcely knew his own. He knew little or nothing of any science, but, if a clever lad, he could write rather ordinary Latin verses and construe Greek plays. Most unfortunately, in many—he thought he might say in most—cases our public school boy of eighteen or nineteen had, with but a few exceptions, acquired a rooted dislike of all learning and all culture, possibly from perfunctory teaching in unduly large classes and undue exaltation of athletics. It seemed to him that, apart from the healthy atmosphere of a good public school, the whole was a pitiable result in the way of preliminary education. He hoped he should not be thought to suggest that some training in Latin or Greek was of no value. He thought quite

differently. But why drive every one along the same road, and why spend seven or eight years of a most receptive time of life in the impossible task of trying to make every one a classical scholar? Surely out of the seven or eight years of public-school life mental training could be given in the scientific and structural study of foreign modern languages, which should also be, of course, taught colloquially. If the exaggerated time given to dead languages were saved, there would be no difficulty in teaching geography of all kinds, some history and applied mathematics, and at least one science, in a reasonably efficient way. But, leaving the subject of our public schools, and without discussing the curricula of the old universities, we found, as in primary education, that in this country we began and finished technical education at an age which seemed to him too early. He had before him a statement prepared at the Merchant Venturers' Technical College at Bristol—a return of all the students fifteen years old and upwards taking day technological courses at all the teaching institutions in Great Britain and Germany. He had alluded mournfully to the absolute numbers of technical students in the two nations, but the grouping into years was even more disheartening; and much the same state of things was found in the United States as in Germany as regarded third, fourth and post-graduate study.

He ventured to hope that, as a large proportion of our technical students were in London, we might look for help in the London University, now happily constituted a teaching university, which would co-ordinate the work of so many teaching institutions of many various kinds, and would induce longer courses of study. It was a satisfaction also to record that the older universities were working on the same lines, though not in all cases so liberally; and we must all recognise the valuable work done of late at Cambridge, Victoria, Glasgow, Edinburgh and other universities. Let us then not be content with present methods, but aim at something better—some system which would bring out at the really valuable years the best of our British intellect. It had no inferiority to that of other nations, its records were of the most brilliant kind and it was for us to be satisfied with no system that was deficient in grasp or which stopped short of perfection. Finally, let us endeavour each in his own sphere of influence to direct, without any exaggeration, but with profound conviction, the attention of our commercial classes to the fact that technical education of the best and thorough kind was an urgent and crying necessity if we were to continue in our position among the nations of the world.

A vote of thanks was passed to the President for his address.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE Architectural Association of Ireland has issued a very interesting programme of lectures on architectural history and building construction in connection with the second half of the session 1902-3, which opened on Tuesday. The Association was restarted in 1896 with a view to the improvement of educational facilities and of architectural study in Ireland. With this end in view the Association has done much by means of lectures, classes, &c., but while a good deal has been accomplished, much remains yet to be done. The members of the Association seek to establish in Ireland such regular courses of study and other educational facilities as now exist in London and elsewhere. The matter is one which ought to interest the general public no less than the architects, for it is only by such means that a sense and appreciation of the beautiful and good in architecture can be cultivated and insured. A glance at the lectures, both historical and practical, which make up the present programme will convince any careful reader that they are very comprehensive in extent and subject, and they will be delivered by lecturers whose knowledge enables them to speak as experts. We notice that the Association has now an interesting lending and reference library, which will be of great use to the members. The volume of by-laws contains also a catalogue of the library, and particulars with reference to the travelling studentship and the various prizes offered for competition amongst members and students.

GENERAL.

The Painted Plaster Statues which were experimentally placed in the gallery of the Petit Palais, Paris, have now been removed. It was considered that they failed as an element of decoration.

The Housing Committee of the Glasgow Corporation have decided to recommend that the scheme for providing houses for workmen in the east end of Glasgow be not proceeded with. The sanction of the Council will in the usual way require to be secured. The estimated cost of the scheme was 100,000*l.*, and it was proposed to erect 700 houses on the

Kennyhill estate of one, two and three apartments at an annual rental of 5*l.*, 8*l.* and 12*l.* Seventy designs for the scheme had been sent in by architects and the premiums awarded.

Mr. A. J. Evans will deliver a course of three lectures at the Royal Institution on "Pre-Phoenician Writing in Crete, and its Bearings on the History of the Alphabet." On January 30, Professor W. E. Dalby will lecture on "Vibration Problems in Engineering Science."

The Tramways Committee of the Leicester Corporation have accepted tenders for nearly 78,000*l.* for the first section of the electric tramways scheme for the borough. The whole of the contracts have gone to English firms.

The Poplar Council are considering the advisability of carrying out street improvements in the borough at a cost of nearly 9,000*l.*

Messrs. Lyons & Co., Ltd., state that they designed and executed the whole of the work at the Trocadéro Restaurant.

M. Legrain, the French sculptor, was possessed of a reproduction in bronze of *La Dentellière*, which his friend Jules Dalou presented to him. He set it up in the courtyard of his house. A few days ago it was stolen. It is the only copy in existence, and the original is in a public gallery of the United States.

The Archbishop of York proposes to institute a special fund intended to assist needy schools in the matter of necessary repairs, and also in cases where alterations and improvements may be required by the local education authority.

Mr. A. Hunter Crawford, president, began on Wednesday last before the Edinburgh Architectural Society the first of a series of eight lectures on the "Building of a House."

The Model of the statue of Alfred de Musset by M. Mercié has been accepted by the Municipal Council of Paris. It is expected that the work, which is being presented by M. Osiris, will be ready in a year.

The Holborn Borough Council have instructed Messrs. Douglas Young & Co to dispose of two freehold building sites, one situated in the Gray's Inn Road, having a frontage of 83 feet 6 inches to that thoroughfare and covering an area of 22,460 square feet; the other is situated in Little Saffron Hill, close to Farringdon and Clerkenwell Roads, and covering an area of 6,662 feet.

Mr. Henry Syer Cuming, F.S.A., vice-president of the British Archaeological Association, has bequeathed to the parish of St. Mary, Newington, his museum, representative of natural history, archaeology and ethnology, and his library and his collection of coins and medals and his curios, to be retained as the Cuming Museum, and he bequeathed to the parish 8,000*l.* in trust, to apply the income thereof in payment of the salary of a competent curator.

The Paddington Urban Council are negotiating with the Regent's Canal Company with a view to the provision of a new bridge over the canal at Warwick Road, and abutting improvements, at an estimated cost of 10,000*l.*

Mr. Herbert Kynaston has been appointed by the Colonial Office director of the Geological Survey of the Transvaal. In 1895 Mr. Kynaston was appointed to the Geological Survey of Scotland, and during the eight years of his service has done valuable work in the Western Highlands, and published several papers dealing mainly with researches on igneous rocks.

Mr. James Foster Wadmore, architect, died on Saturday last at Tonbridge in his eighty-first year. He was a member of several archaeological societies, and was a former Master of the Skinners' Company. He designed and erected the first chapel at Tonbridge School.

M. Bouguereau has been re-elected president of the Society of French Artists, and MM. Scelliers de Gisors and Bartholdi vice-presidents. M. Robert Fleury has been appointed president of the jury for paintings, M. Bartholdi president of the jury for sculpture, and M. Albert Maignan for the decorative arts in this year's Salon.

The War Department at Washington has decided that the German Emperor's gift of a statue of Frederick the Great shall be placed in the park of the new Military College, the grounds of which will be arranged for the reception of statues of various international military heroes.

The International Congress of Hygiene, the eleventh of the series, will be held at the Palais des Académies, Brussels, during the first week in September next.

The Premium of 2,000 rs. offered by the committee of the Queen Victoria Memorial for the best design for a clock tower and canopy, to be erected at Allahabad, India, has been awarded to Mr. Robert F. Sherar, chief assistant to Mr. Peter L. Henderson, architect, Edinburgh.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER" Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

CASTLEFORD, YORKS.—Mar. 31.—Designs are invited for a free library. Premiums 15*l.* and 10*l.* respectively. Mr. H. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

KINGSTON-ON-THAMES.—Jan. 15.—Plans and designs are invited for a central home and cottage homes for children of both sexes in the Kingston Road, in the parish of New Malden. A premium for the first three selected plans of 25*l.*, 15*l.* and 10*l.* respectively is offered. Mr. Jas. Edgell, clerk, Union Offices, Coombe Lane, Kingston-on-Thames.

SMETHWICK.—Jan. 31.—Competitive designs and tenders are invited for erection of a refuse destructor. Mr. C. J. Fox Allin, borough surveyor, Town Hall, Smethwick.

ST. IVES, CORNWALL.—Jan. 31.—Competitive plans are invited for the erection of municipal buildings, to consist of a guildhall, council-chamber, jury room, public hall, town clerk's office, surveyor's office, treasurer's office, muniment room, parochial office, mayor's parlour and fire-brigade station and offices. Premiums of 70*l.* and 30*l.* respectively will be awarded to the architects whose plans and specifications are considered to be first and second in order of merit. Mr. Edward Boase, town clerk, Town Clerk's Office, St. Ives, Cornwall.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C.E., borough surveyor, Council House, Sutton Coldfield.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—For pulling-down twenty-five old cottages in Church Street and Fleet Street, and the erection of twelve new houses in Church Street and Booth Street. Messrs. Thos. George & Son, architects, Old Square, Ashton-under-Lyne.

ASHTON-UNDER-LYNE.—Jan. 16.—For providing conveniences for ladies at the public baths, Henry Square. Mr. H. Lindley, architect, Market Avenue, Ashton.

WREXHAM.—Jan. 13.—For providing and fixing boarding on the underside of the roof over the swimming-bath. Particulars on application to the Borough Surveyor.

THE new Roman Catholic Cathedral at Westminster was completed on Wednesday as regards its exterior, after being seven and a half years in course of construction, by the erection of the gilt iron cross on the top of the campanile. The cross stands some 10 feet high, and before its erection Cardinal Vaughan had specially blessed it. The Cardinal had also placed a reputed fragment of the true cross, which had been in England for several hundred years, in a cavity in its central part.

TENDERS.

A PORTRAIT in oils of the late town clerk of Paddington, Mr. Frank Dethridge, is being painted by Mr. Sidney Paget, and will, with other gifts, shortly be presented to Mr. Dethridge in appreciation of thirty-four years' public service in the borough.

MR. J. R. ELLIOTT, Assoc.M.Inst.C.E., of Burton Buildings, Parliament Street, Nottingham, announces that he has taken into partnership Mr. A. Goodwin Brown, civil engineer, who has been assistant to his father, Mr. Arthur Brown, M.Inst.C.E., the city engineer of Nottingham.

THE Chorley Rural District Council have just completed a water-supply scheme for the townships of Whittle-le-Woods, Clayton-le-Woods, Heapey and Wheelton, at a cost of 8,600*l.*, and water was turned on for the first time by Mr. J. N. Boothman, manufacturer, who has taken a prominent part in the promotion of the scheme. A reservoir has been constructed at Heapey, and water is obtained from the Thirlmere aqueduct. A gold key was presented to Mr. Boothman as a memento of the occasion, and the members of the Rural Council were entertained to dinner at Whittlesprings.

THE Duke of Westminster has become a patron of the International Engineering, Machinery, Hardware and Allied Trades Exhibition to be held at the Crystal Palace from March to May next. Among other patrons of this exhibition are Lord Strathcona and Mount Royal, Lord Avebury, Lord Kelvin and many distinguished gentlemen occupying a prominent place in the industries represented, all of whom recognise the importance of an exhibition which cannot fail to be of immense educational benefit and tend to promote the commercial prosperity of this country.

ST. JOHN'S United Free Church, Carlisle, was reopened, after alterations and repairs, on Sunday. The alterations have been rendered necessary owing to the want of sitting accommodation, and operations on the building were begun in May last. The side walls were removed and transepts built at either side, which will give accommodation for over 800 persons. The roof has been entirely removed, and a substantial arched wooden roof, painted a dark brown colour, takes its place. Some improvements have also been made in the pulpit, and the windows have all been fitted with cathedral glass. The cost of the alterations is over 1,000*l.*

THE most recent addition to the schools of the School Board of Glasgow was formally opened on Monday evening in

North Montrose Street. This school takes the place of the old city public school, formerly the High School, the site of which was acquired for the new technical college. It has been called Provanside public school. The site extends to about 7,075 square yards, and in the accommodation and arrangement of classrooms the most modern ideas have been carried into effect, resulting in perhaps the finest educational institution belonging to the Board. On the ground floor is the central hall, 96 feet long and 28 feet wide, the main infant-room and eight classrooms. On the first floor are ten classrooms, and on the second floor are three classrooms, drawing and cast-room, chemical and physical laboratories and a well-equipped gymnasium. In the basement there is a manual instruction room for 50 scholars. Apart from the laboratories, &c., there is accommodation for 1,376 scholars. The heating and ventilating are mechanical, being on the propulsion system, and the whole building is lighted by electricity. The school is carried on as a higher-grade school with a commercial curriculum, and a large evening school is also held in the building.

THE formal dedication of the new mission church which has been erected in Tithelbarn Road, Littleworth, Staffs, to meet the growing requirements of the district, took place on the 28th ult., when the service was conducted by the rector (the Rev. the Hon. C. J. Littleton) in the presence of a good congregation. The building, which is in the late Gothic style, and will be known as St. John's Church, measures 52 feet by 24 feet in the interior, and there is a vestry on the north side 15 feet by 12 feet. Built of red brick, with stone dressings and white painted woodwork, the church has a neat and tasteful appearance. It stands on a triangular piece of land, and provides accommodation for 170 persons. The lighting and ventilation arrangements are good, and a heating apparatus has been installed. A bell has been placed in the gable at the west end. The reredos at the east end of the interior is of wood, painted sage green, with gold mouldings. The church was erected by Messrs. Adams & Pemberton from the designs of Mr. George Wormal, architect. The cost amounts to about 800*l.*

THE telephone committee of the Glasgow Council have recommended that application be made to the Secretary for Scotland for further borrowing powers to the amount of 80,000*l.*, making a total of 300,000*l.*

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent warm-air ventilating Manchester grates to the small-pox hospital, Warrington.

STRETTON CHURCH, Oakham, has recently been fitted with the well-known "Small Tube" hot-water heating apparatus, by Messrs. John King, Ltd., engineers, Liverpool, employing their latest improved economical coil heater.

A NEW Cambridge quarter-clime clock, showing the time upon one large external dial and striking the hours on the fine tenor bell of over a ton weight, has been formally set going at Crewkerne parish church, Somersetshire. The frame is fixed on strong iron brackets fixed to the wall of the tower, thus giving a firm foundation for the clock to rest upon, and, there being ample room in the clock chamber, a long 2-seconds compensated pendulum was attached to the clock, which has got all Lord Grimthorpe's improvements inserted, and was made and fixed by Messrs. W. Potts & Sons, clock manufacturers, Leeds.

MESSRS. EASTON & CO., LTD., successors to Easton, Anderson & Goolden, Ltd., engineers, Broad Sanctuary Chambers, S.W., have secured the order for the complete installation of electric lifts (19 in number) for the new Midland Grand Hotel at Manchester, now in course of construction. The hotel in question is intended to be in every respect an example of what a modern, up-to-date hotel of the highest class should be; and it is satisfactory that the order has gone to an English company, and that, as a result, every electric lift in the hotel will be British-built throughout.

A VERY USEFUL DIARY.

WE have received from the Patent Victoria Stone Company, Ltd., of Hamilton House, Bishopsgate Street Without, a copy of their handsome and exceedingly useful diary, which comprises, in addition to the diary itself, which is of large folio size, an excellent blotting pad and a not less handy scribbling pad. The diary contains, in addition to the abundant writing space, a calendar, some valuable postal information, some interesting particulars as to the composition, qualities and capabilities of patent Victoria stone, and a number of admirably reproduced photographic views of the company's premises and of the numerous and very various buildings in whose erection the patent Victoria stone has been employed.

ELECTRIC NOTES.

THE Frodingham (Lincs) ratepayers have approved of a provisional order for electric lighting being obtained.

THE electrical engineer, Mr. Price White, is preparing plans for an electric-lighting scheme for Holyhead.

SANCTION to a loan of 69,000*l.* for electric lighting has been obtained by the Ipswich Town Council.

THE Devonport Town Council seek power to borrow 30,000*l.* for the electric-light undertaking.

THE Galashiels Town Council sub-committee are considering the introduction of electric lighting.

THE Private Bill Office has issued the text of the Bill for the construction of an electric railway between London and Brighton. The capital of the company will be 4,500,000*l.* Six years is allowed for the completion of the railway, which is to be a mono-rail.

ARBITRATION proceedings in connection with the purchase by the borough council of the Marylebone undertaking of the Metropolitan Electric Supply Company have already, it is reported, cost the ratepayers between 60,000*l.* and 70,000*l.* The award of the arbitrator is now awaited. It is anticipated that the purchase price will not be less than a million sterling.

IN connection with the electrification of the London County Council trams large bodies of men are engaged at Kennington in pumping the old river Effra. It is conjectured that had this step not been taken the water would at no distant date have interfered seriously with the working of the trams. The operations, it is expected, will occupy several weeks.

A RATEPAYERS' meeting was held at Dover on the 6th inst. to consider the proposal of the Corporation to take over the electricity supply undertaking at a cost of 155,960*l.* There was much opposition, and after the Mayor had declared carried the resolution in favour of the proposal a poll of the town was demanded. This will cost four or five hundred pounds.

BUILDING AND BUILDERS.

THE Aberdeen Town Council seek authority to borrow 25,000*l.* to acquire the bathing establishment and also to erect additional baths.

THE work of constructing St. Thomas outfall sewer, Exeter, to the length of 1,000 feet, at an estimated cost of 390*l.* is to be taken in hand.

THE scheme for a new Methodist New Connexion church at Dudley Road, Birmingham, is far advanced, and it is proposed to lay the memorial-stones when the conference meets at Dudley.

PLANS of the new Bluecoat Hospital to be erected at Wavertree have been prepared for submission to the Charity Commissioners, and it is hoped that building operations will commence in the coming spring.

HOMERTON College, Cambridge, is being enlarged at a cost of 8,000*l.*, so as to provide for fifty more students. A principal's house, new classrooms and a scientific laboratory are included in the extension scheme. Eleven acres of land have been added to the college estate.

THE Sedgley School Board have approved the designs of Mr. S. H. Eachus, architect, of Wolverhampton, for a new school to accommodate 350 girls, as well as designs for a cookery and laundry centre and caretaker's house, and for the rearrangement of the old schools at Mount Pleasant.

A LOCAL Government Board inquiry has been held at West Hartlepool respecting the application of the Council to borrow 9,250*l.* to defray the cost of the new promenade and levelling of the banks between West Hartlepool and Seaton Carew.

A SCHEME is being developed for dealing with the Notting Dale area, by which it is hoped that some of the worst part of the property in that neighbourhood will be demolished, and better dwellings erected for the residence of the North Kensington poor.

THE works committee of the Paddington Borough Council are negotiating with the Regent's Canal Company with a view to the provision of a new bridge over the canal at Warwick Road, and abutting improvements, at an estimated cost of 10,000*l.*

THE building of a new infectious hospital is about to be commenced at Ackton, in the urban district of Featherstone, for the accommodation of the districts of Castleford, Normanston, Featherstone, Whitwood and Altofts. Mr. W. Hamilton Fearnley has been appointed architect for the work.

THE foundation-stones of a new cottage hospital have been laid at Rhymney, Wales. The estimated total cost of the building is 2,285*l.* The contract is in the hands of Messrs. W. Williams & Sons, New Tredegar and Bargoed, the architect being Mr. Llewellyn Smith (Messrs. Llewellyn Smith & Davies), Aberdare.

THE Poplar Council are considering the advisability of carrying out street improvements in the borough necessitating an outlay of about 9,000*l.* The works committee have directed that the London and India Docks Company be communicated with regarding the defective condition of the footways on the dock bridges in Bridge Road and West Ferry Road.

THE memorial-stones have been laid of the new Baptist church and schools which are to be erected in Bearwood Road, Smethwick. The church, which is estimated to cost 3,500*l.*, will accommodate 500 worshippers, whilst the school buildings are estimated to cost 1,270*l.* At present it is proposed to proceed with the erection of the schools, which will be used as a church until the scheme is completed.

ST. MARY'S CHURCH, the oldest church in Harrogate, has been closed. The Harrogate borough surveyor examined the building, and declared it unsafe for public worship. The piers supporting the nave arches have shown signs of giving way, and there is every appearance of a further settlement. The church will now without doubt have to be rebuilt, and plans have already been approved. The proposed new building is estimated to cost between 9,000*l.* and 10,000*l.*

IN Portsmouth dockyard a site is being prepared for a large block of engineering workshops that are to be erected at a cost of 188,000*l.* The greater part of the money is expected to be voted in the next Naval Estimates. When finished the new shops will be thoroughly equipped, and will add materially to the resources of the naval establishment. During the engineering strike a year or two ago the Admiralty

JOSEPH FISHBURN, High Wycombe, Bucks.

was put to great inconvenience, and it is to obviate a recurrence of the difficulty, a news agency states, that the erection of the new shops at Portsmouth has been decided on.

FIVE blocks of working-class dwellings, each six storeys in height, are to be erected by the Chelsea Borough Council in Beaufort Street. The site was acquired some time ago for the purposes of housing the working classes, but the details of the adopted scheme have only just been made public. Accommodation is to be provided for 933 persons, the number of tenements being 261 and the number of rooms 583. The total estimated cost is 49,532*l.*, or about 85*l.* per room, and the capital outlay in connection with the scheme will not fall far short of 70,000*l.* The metamorphosis of King's Road is proceeding apace. The pulling down of a block of houses adjoining the Poor Law Offices has been taken in hand, and on the site thus cleared will shortly be raised the imposing workhouse extension which is so much needed. The new Palace of Varieties is nearing completion, whilst on the opposite side of the way the municipal baths have been closed preparatory to extensive alterations, perhaps to entire reconstruction. The widening of a portion of the main road near Beaufort Street is now completed, as is the first instalment of several other improvements of a like nature, including the widening of the entrance from Sloane Square.

LAST Friday's *Gazette* contained a notice of the Mersey Docks and Harbour Board announcing their intention to alter and extend the Liverpool Landing-stage. The work, which is to provide additional berthage accommodation for passenger ferry steamers, consists of continuing the western face of the stage a distance of 15 feet to a point opposite the present south end of the stage, and extending it beyond that point a further distance of 15 feet. This extension will be supported on pontoons, which will rise and fall with the tide in the same way as the existing stage, and have similar draught—about 3 feet. The work will be commenced in six weeks' time, and will not project beyond the western face line of the existing structure, nor further impede or interrupt the tidal or other waters of the river.

THE housing committee of the Southampton Corporation have had submitted to them by Mr. Hair, architect, another scheme for the development of the area north of Simmel Street. The plans provide for sixty-two three-room cottages and four four-room cottages, giving accommodation for 404 persons. The rents are estimated at 7*s.* 9*d.* per week for four-

room cottages and 5*s.* 9*d.* to 6*s.* for three-room cottages. Mr. Hair estimates that the scheme will cost 11,400*l.*, embracing 10,655*l.* for cost of buildings, 532*l.* 15*s.* architect's fees and expenses, and 200*l.* clerk of works. To raise this amount it will be necessary to issue 12,391*l.* 3 per cent. stock. The maximum period allowed by the Local Government Board for buildings of this class is forty years. It is estimated that there would be an excess of income over working expenses of 596*l.* 18*s.* 2*d.* The housing committee have approved of the plans, and have decided to recommend the Council to make application to the Local Government Board for sanction to borrow 12,500*l.* to carry out the scheme. The Council are to be requested to engage Mr. Hair as architect at a fee of 5*l.* per cent. on the total cost of the buildings, such amount to include the cost of preparing all plans.

MR. E. P. BURD, Local Government Board inspector, held an inquiry at the Stafford Guildhall on the 30th ult. respecting the application of the Mayor and Corporation of Stafford for the issue of a provisional order under section 303 of the Public Health Act, to partially repeal, alter, or amend the Stafford Corporation Act, 1882, so as to enable the Corporation to borrow, with the sanction of the Local Government Board, additional money up to 5,000*l.* for the purposes of their water undertakings. Mr. Matt. F. Blakiston (town clerk) appeared for the Mayor and Corporation, and there were also present Messrs. R. Battle (deputy town clerk), G. S. Parker (borough accountant), W. Blackshaw (borough surveyor), Aldermen F. Greatrex and S. G. Lovatt, Councillors T. Swift, J. Holmes, M. Bedford, W. Salisbury and T. Westhead. The town clerk explained that the application was for a provisional order which would enable the Corporation to apply to the Local Government Board for sanction to borrow money in order to extend their water mains to the dwellings being erected by Messrs. Siemens, and to the new cottage property being put up off Newport Road, for Dr. F. H. Marson. The borough surveyor produced plans of the districts named. Mr. Swift asked what was the amount of the loan to be asked for, and the town clerk replied that there would be two sums of 346*l.* and 30*l.* Mr. Swift said he supposed the 30*l.* was for Dr. Marson's cottage property which was outside the borough, and he contended that the mains ought not to be laid outside the borough unless more was paid for the water than was paid in the borough. The borough accountant explained that the residents in the outside districts did pay more for their water

CABOT'S INSULATING & DEAFENING QUILT.

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay, moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

with the exception of those in Rowley Park, who allowed the Corporation certain privileges in consideration of no extra charge being made for water. Mr. Swift said the privileges were not really privileges. The inspector said that was a matter which he could not go into and the inquiry was closed.

OBAN ELECTRIC LIGHT.

THE electric-lighting installation which has been carried out by the Oban (N.B.) Corporation under the Oban Electric Lighting Order, 1901, has been completed, and the light was switched on last night. The installation is on the continuous current three-wire system, the pressure at consumers' lamps being 230 volts. The supply is suitable for light, power, heating, cooking, &c. Distributing mains have been laid in the principal streets of the town and where a demand is anticipated in the first instance, but they are so arranged that they can be readily extended when required without interfering with the streets in which the mains are laid. The mains are water-tight throughout, to guard against the possibility of floods, and consist of three core cables, which are drawn into stoneware ducts in the principal streets. The esplanade, north pier and the main streets are lit by thirty-one arc lamps, the posts carrying these having also brackets for incandescent lamps, which will be switched on in place of the arc lamps late at night. In other thoroughfares Nernst lamps will be tried in the existing lamp-posts. The generating station is situated at Lochavullin on land belonging to the Corporation, and close to the railway, from which there is a siding running close to the boiler-house. The plant at present installed consists:—In the boiler-house, two Babcock & Wilcox water-tube boilers, each of sufficient size to supply steam for engines of about 300 h.p. The boilers are specially arranged to burn Scotch coal with a minimum of smoke. A large feed tank, and under it a pump-room, is provided, in which is placed a feed pump of Messrs. J. P. Hall & Co.'s manufacture. The feed pipes are in duplicate, and in addition to the feed pump, injectors are fitted to each boiler. In the economiser-house is a Green's economiser, having ninety-six tubes, and space is provided for another economiser of the same size. The steam pipes between the boilers are in duplicate throughout to minimise the risk of breakdown. In the engine-room are three steam dynamos, each consisting of a vertical compound high-speed engine, coupled direct to a continuous current dynamo, and

running at 500 revolutions per minute. Each engine is of about 100 horse-power. The whole regulation of the machines in the engine-room and distribution of electricity to the town is regulated from a switchboard placed in a gallery at the east end of the engine-room. The station and plant have been arranged with a special view to economy and to be worked with a minimum staff, and the buildings are so arranged that extension can be done without interference with the present structure. The whole installation has been carried out from the designs of Burstell & Monkhouse, Westminster, Mr. M. P. Plunkett being resident engineer for the Corporation. Mr. Alexander Sharp, C.E., Oban, was architect for the station.

DEEP-WELL BORES.

SOME two years ago the Wallasey Urban District Council, which supplies water not only to Wallasey itself, but also to Seacombe, Liscard, New Brighton and Egremont, with a total population approaching 60,000 inhabitants, found it necessary to augment their sources of supply. They accordingly in July 1900 placed a contract with Messrs. Mather & Platt, Ltd., for two deep boreholes, which were successfully completed by June, 1901. Each borehole starts with a diameter of 33 inches at the top, and finishes with 15½ inches at the bottom, which in one case is 903 feet from the surface, and in the other 810 feet. The 903 feet were bored in 110 working days, giving an average rate of sinking of 8·2 feet per day; the bore was almost entirely through red sandstone rock. These two boreholes yield 2,250,000 gallons per day, but to serve as a stand-by the Urban District Council has determined to carry to greater depths an existing well 12 feet in diameter and 166 feet deep, in which two pumps are at work side by side. For this purpose another contract has been placed with Messrs. Mather & Platt, Ltd., for two new boreholes, to commence at the bottom of the well, and both to be carried down for 150 feet at a diameter of 42½ inches. Here at a depth of 316 feet one borehole will stop, but the other will be continued 300 feet at a diameter of 20 inches, and yet another 200 feet at a diameter of 15 inches making a total depth of 650 feet from the well bottom, or 816 feet from ground level. A feature of the contract is that only one of the pumps in the well is to be stopped at a time, and special arrangements have therefore been made to secure the continuous availability of the other during the boring operations.

REGISTERED PLUMBERS.

At a meeting of registered plumbers (masters and operatives) held at the Memorial Hall on the 29th ult., Mr. C. Hudson (late Master of the Company) in the chair, the undermentioned were elected to fill the vacancies in that section of the registration committee which represents directly the registered plumbers of London and the district:—

Masters.—W. E. Bone, W. C. Clegg, G. B. Davis, S. S. Hellyer, J. Hume, J. Knight, F. Nichols, C. Parks, T. L. Pitt.

Operatives.—F. Brown, J. W. Clarke, C. Dean, J. A. Mills, R. A. Nurse, G. W. Stacey, G. Taylor.

The remaining sections of the committee are directly elected to represent the London Society of Master Plumbers, London lodges of the Operative Plumbers, and the sanitary and professional bodies concerned in the plumbers' registration system in the public interest.

NICARAGUAN LABOUR LAW.

THE Labour Law of Nicaragua of June 30, 1901, recently put into effect, contains some rather startling provisions in the way of defining the relations between labour and capital.

1. A labourer is defined as any person, male or female, over sixteen years of age not having a capital of 500 pesos (about 100 dols.).

2. All labourers must have an employer. Anyone found unemployed will be imprisoned for twenty days and made to labour on public works while awaiting an employer. Every employer of labour must purchase a small booklet (cost, about 20 cents), in which are registered the name, age, description, general characteristics of the person, and conditions of the contract. The employer gives his employé a receipt for the book, which the latter can produce as proof of his good standing whenever arrested by the police on suspicion of being idle. When a labourer has finished his contract with one employer and desires to go to another, he must take his "book of labour" and present it to his next employer and take a receipt, the change being registered by the judge of agriculture.

3. If a labourer desires money in advance, his employer can give it to him only as a loan without interest, to be paid by retaining one-half of the salary or wages until the debt is cancelled.

A labourer leaving his employer without satisfactory settlement of his debt will be imprisoned, fined and obliged to return and work it out.

4. Any person employing labourers without this "book of labour" will be fined 200 pesos (about 40 dols.).

The purposes of the law are to do away with the pernicious habit formerly in vogue of advancing wages to labourers on a contract, which made the labourer a slave until he settled his account, and to prevent idleness and viciousness, by obliging everyone without capital to be employed. Consul Donaldson, in "Consular Reports" for December, states that the law caused general consternation at first among all classes, but as it is being enforced everyone is becoming reconciled, and the general effect seems to be beneficial.

BARNET CHURCH.

A FEW years ago the Chancel Estates Trustees adopted a plan for reseating the whole of Barnet parish church. It was found impossible at that time to do more than to reseat the nave. The fittings of the chancel had long been unworthy of so noble a church, but this defect has been remedied by the provision of an elaborately carved set of choir stalls, fitted with ornate screenwork at the back. This addition to the furniture of the church has been made at a cost of about 1,000*l.* The stalls, erected on the north and south side of the chancel, are of the fourteenth-century Decorative style of architecture, which harmonises with the ornate workmanship of the pulpit. There are six stalls on either side for the adult members of the choir, and the ends are carved and surmounted by figures of angels holding musical instruments. There is a canopy over each set, and running along the front in gold letters are the words:—"We praise Thee, O God, we acknowledge Thee to be the Lord. All the earth doth worship Thee, the Father Everlasting." The boys' stalls are treated in the same elaborate style. On each of the front panels is a figure of a boy chorister, and these figures are represented as joining in singing, "They rest not day and night, saying, Holy, Holy, Holy, Gord God Almighty, which was, and is and is to come." The stalls are supplemented by two new prayer-desks, which are carved and ornamented. The decorations include symbolical figures of the four Evangelists—Matthew, Mark, Luke and John. Mr. J. C. Traylen, Stamford, was the architect, and the work was executed by Messrs. J. Thompson & Co., Peterborough.

Hardware of Ornament.

Appropriate to its Surroundings.

Comprising Decorative Metal Work for Doors, Windows and Cabinets, in practically all Schools, and a great variety of finishes.

GROWTH OF MANCHESTER.

WITHIN the year ended October 31, says the *Manchester Courier*, 855 sets of plans for all kinds of buildings in the city were submitted for approval to the improvement and buildings committee of the Manchester City Council, and of these 754 were approved and 101 disapproved. In addition to these approvals, which related to permanent buildings, seventy-eight licenses were granted for temporary structures. New dwelling-houses to the number of 1,662 were in the same period certified as fit for habitation. By way of comparison it is worthy of mention that in the year ended October 31, 1898—four years ago—2,773 new houses were certified as fit for habitation. That was the largest number ever so certified within the city in the course of a single year. Five years previous to that date, in 1893, only 682 new dwellings received certificates of fitness. Thenceforward the yearly total showed steady increases up to 1898, when the highest point was reached, and since then there has been a falling off. In 1899 there was a slight decline, the figure being 2,704, or only 69 below that of 1898, but in 1900 there was a further drop to 2,308, a difference of 396 by contrast with the previous twelve months, and in the year ended October 31, 1901, there was a further reduction to 1,677, or 1,096 fewer new houses were certified than in 1898. Still, the figures show that during the past five years 11,124 new residences have been constructed, so that the yearly average has been maintained well above the level of 2,000. It has often been stated that at the time when the Ship Canal was opened Manchester had apparently arrived at her zenith, and was showing signs of coming decay in commerce and industry, and of a decrease in her population. Comparison with the figure of new houses in 1893, the year before the Ship Canal was brought into use, shows that side by side with the progress of the port has gone a steady increase in the number of inhabitants of our municipal area. The borough of Salford and other areas of local government within the radius of the Canal's influence can tell tales of proportionate advancement. The sum total of residences which have sprung up as the direct outcome of the making and working of the Canal must be enormous. Three or four years ago it was publicly declared to be 20,000. Lately we have not heard any calculations or speculations as to the number which have since been erected. Coming back to city figures it has to be added that whilst many buildings have

sprung into existence, others have suffered from the ravages of time and wear. No fewer than 550 buildings in the city were reported to be dangerous in the past municipal year. In 445 cases out of this total it was found necessary to serve notices for the removal of the danger, which perhaps, as a rule, meant the removal of the structure affected. It will be borne in mind that dwelling-houses formed only a proportion of the condemned structures, and that old walls, factories, warehouses, chimney-stacks and nondescript buildings were included.

An important change with regard to public improvement in Manchester is the establishment in this newly-ended year of a city architect's department to meet the extraordinary demands which were made upon the administration of the city surveyor's department under the old system, whereby architecture was but a branch section of Mr. T. De Courcey Meade's sphere of action. Mr. Henry Price was appointed the first city architect. He came from Birmingham, and entered upon his new duties at the beginning of June. That is little more than half a year ago—not long enough for great achievements. He has, however, not merely set his house in order, but has done good work sufficient to emphasise the wisdom of the Council in having appointed a city architect. In referring to matters relating to architecture so far as city improvements are affected, it is to be understood that much of the work referred to in this article was accomplished under Mr. Meade, the city surveyor, and his architectural staff, of whom a number of the best of its members still ably discharge their duties under Mr. Price. Among the committees actually engaged in new building projects is the baths committee, which is responsible for the construction of the Victoria baths.

These premises are in Chorlton-on-Medlock. They will have three frontages, the main one being towards High Street. The centre of the main façade (which stands back from the road a distance of 33 feet) will be three storeys in height, with high-pitched roofs and ornamental gables, surmounted by a clock turret. The left and right wings are one storey in height, also with high-pitched roofs and gables. The buildings have been designed in the Renaissance style of architecture, the facework being in Ruabon red pressed bricks, and the mouldings, cornices, quoins and other architectural features in buff terra-cotta. The accommodation will consist of three large swimming-baths. That for the males, first class, will be used at times for gala purposes, and has a gallery around same to accommodate about 350 persons, and each person will

have a good view of the pond below. The other two swimming-baths are for males, second class, and females respectively, each having a balcony containing twenty-three wash baths. The males' first-class wash baths are on the ground floor. There are club-rooms and bicycle-rooms for the convenience of bathers to each bath. There are Turkish and Russian baths, comprising three hot-rooms, separate shampooing-rooms, and separate room for douche bath and large and well-lighted cooling-room. The supply of water for the three swimming-baths will be obtained from a deep well sunk on the site and stored in two large tanks constructed over the boiler and engine-houses with a combined capacity of 160,000 gallons. The baths committee are further considering a scheme for the erection of baths and public hall on a site at Bradford, and preliminary plans have been prepared by the city architect. There is also a scheme under consideration for the conversion of dwelling-houses in Hulme into cottage baths.

The members of the sanitary committee have had under consideration for some time a scheme for laying out their estate at Blackley, and the erection thereon of 203 houses for the accommodation of the people displaced by the demolition of insanitary property and various improvement schemes. Designs have already been prepared for the erection of eighty-two dwellings in keeping with the rural surroundings. Several blocks will be in short terraces and a few semi-detached with gardens back and front; three bedrooms are provided and a bath-room. A main avenue will be formed through this estate 20 yards wide, and will join a proposed road which will connect Heaton Park with Rochdale Road. A portion of the estate will be reserved for allotments.

A police and fire-station for the C Division is in course of erection in Mill Street, Bradford, between Rhyl Street and Brownhill Street. In addition to the accommodation provided for the police this building will give plenty of space for three horse-ambulances and two fire-engines at a cost of about 30,000*l*. In consequence of the office accommodation to the town hall becoming every year more limited, it has been found necessary by the watch committee to make provision for the weights and measures department outside the building, and large workshop and offices are to be provided in connection with the Newton Street police-station. Owing to these alterations a large shed is being erected over a portion of the yard at Albert Street police-station to store the barriers which originally were stored at Newton Street. It is also intended to erect a new chief fire-station at the junction of London Road

and Whitworth Street, concerning which much has already been heard from time to time.

On the order of the parks, &c, committee at the present time extensions are being carried out in connection with the registrar's office at Philips Park Cemetery and the extensions to refreshment-room at Boggart Hole Clough. By the markets' committee an extensive addition has been made to the retail fish market, and the city architect and city surveyor are preparing a scheme for the cold-air stores under the market. The electricity committee are about completing the erection of nineteen electric substations within the city and the suburbs. Some of these buildings have handsome exteriors in keeping with the surrounding property. Their total cost will amount to about 80,000*l*.

The Whitworth Hall at Owens College and the Municipal School of Technology in Whitworth Street have been opened in 1902 with great ceremony, in the one case by the Heir-Apparent, who was accompanied by the Princess of Wales, and in the other by the Premier. St. Mary's Hospital is completed so far as the outer structure is concerned, and internal fitting and furnishing are at present engaging attention. The hospital is a handsome embellishment of the approach to Oxford Road station, and will be equipped in the most up-to-date fashion. To the passer-by the situation of the building suggests that the sick women and children to whose surgical needs it is meant to administer may be disturbed by the hum of scores of tram-car trolleys or the overhead wires, with an occasional shriek from engines on the adjacent railway. Yet perhaps it may be taken for granted that such possibilities have been fully discussed by all who are connected with the administration of the hospital, and that everything will be done to secure the peace and comfort of the patients. The Midland Hotel rears its majestic bulk opposite St. Peter's Church with great effect just now, for the maze of scaffolding has been removed from all its upper storeys, and the terra-cotta and faience and polished granite which enter into its construction have been cleaned until they glitter in the winter sunshine. Some four years have elapsed since building operations commenced, and there is a prospect that ere the close of another year the huge hotel will be completed internally and ready for occupation by numerous guests. It will long feast the eyes of onlookers as one of the handsomest buildings in the city. In Spring Gardens the new offices of the Economic Fire and Life Company and premises of Parr's Banking Company give a vastly better outlook to the widened thoroughfare. Albert Square

NORMAN & STACEY, Ltd. DESIGNERS and DECORATORS,
252, 253, 254, 255 & 256 TOTTENHAM COURT ROAD, W. (Oxford Street End).

has been much improved in appearance by the extension of a good-looking stone building for the Northern Insurance Company at the corner of Clarence Street, and the building of offices for the Eagle Assurance Company is rapidly approaching the final stage in Cross Street, between King Street and South King Street. New structures have been brought into occupation since the end of last year on three sides of the Conservative Club, the greater portion of the block having an outlook upon St. Ann's Churchyard. In Oldham Street a large block of business premises bids fair soon to add to the importance of that old-established shopping quarter, and some distance away an immense warehouse of imposing design is being pushed forward. These, of course, are little more than a selection out of the many extensive building projects which are in various stages of realisation in the centre of the city, and which are to be met with on all hands.

Among a fair number of important street widenings and improvements which have been carried out in various parts of the city, under the direction of Mr. Meade, is the widening of Rochdale Road, under the powers of the Manchester Corporation Act, 1897, from 14 to 25 yards. The work was previously commenced, and has been continued from Lees Street to Pilling Street. The buildings of the Corn Exchange Company in Hanging Ditch are rapidly nearing completion, and the widening of the street in front of the handsome structure will shortly be effected in a style well calculated to make the word "Ditch" a misnomer. In connection with the improvement of Corporation Street, Cannon Street and Hanging Ditch, the whole of the property bounded by these streets has been purchased. Operations have been started by the demolition of the Spread Eagle Hotel and Messrs. Lever Brothers' corner premises. When the adjoining property in Corporation Street is taken down the width of that important thoroughfare will be increased by nine yards.

The intended new street between Ashley Lane and Charter Street will soon be completed. The whole of the property has been removed, and the street is in course of formation. As a result of the scheme the Corporation will have several desirable plots of vacant land for sale suitable for the erection of warehouses, workshops and other business premises. A continuation of this better means of access to and from the manufacturing district along the Irk Valley is being made by the widening also of Long Millgate from 9 to 16 yards, the purchase of the property required for the purpose being now in progress. When the projected change has been entirely

effected the city will be in possession of a fine new thoroughfare 16 yards wide, extending from Corporation Street to Charter Street.

At the Knott Mill end a great improvement has been accomplished in Whitworth Street West during the year by the reconstruction of the canal tunnel running under Deansgate, and the provision of a towing path under the street level in lieu of the boats being worked through with boat hooks. The work was of considerable magnitude. It was carried out in Whit-week at a cost of over 10,000 $\frac{1}{2}$. Its completion has been the means of allowing the whole width of Whitworth Street to be constructed to the one level, and further of providing a fine street area at this point. In Whitworth Street West, between Knott Mill and Gloucester Street, the Corporation have recently sold several plots of vacant land along the line, but there are others still in the market. Incidentally it may be mentioned that the Corporation have now disposed of the whole of the vacant land along Deansgate, although several plots still remain for sale in the neighbourhood of Quay Street and New Quay Street.

Newton Heath district is practically divided by the Rochdale Canal, and the means of access to the two sections has been by narrow bridges at Grimshaw Lane, Ten Acres Lane and Droylsden Road. During last Whit-week, when the traffic was suspended, and the water could be run off from the canal, these bridges were widened, that in Droylsden Road from 6 to 14 yards, the one in Grimshaw Lane from 3 1-2 to 14 yards, and the third, in Ten Acres Lane, from 5 to 14 yards. All the works relating to them are now completed, and the new bridges will no doubt much facilitate both vehicular and pedestrian traffic between the localities divided by the canal.

A much needed widening of Wilmslow Road at Fallowfield Brow has been commenced by the setting back to the new building line of the walls and gates of Oakley, the former residence of Mr. S. Baerlein, which is being transformed into a residential club, and this line will be continued to the present footpath in front of Grangethorpe. The large trees, whose preservation was the subject of much public discussion, have been carefully protected on the new footpath. At the base of each of the trees seats of a rustic type have been provided, and now that the citizens are able to see what the Corporation intend to do on this portion of the road they will probably admit that the "City Fathers" are really not the vandals that by some they were imagined to be.

THE LONDON VENTILATING STOVE

Specially Adapted for Hospitals, Infirmarys, &c.
ECONOMISES FUEL. MADE IN TERRA-COTTA.

A continuous current of fresh air is admitted through a shaft bent and warmed by contact with the chambers at back, and discharged into the Ward or Dormitory at an agreeable temperature.

In use at the Cambridge Hospital, Aldershot, Bank of England, &c.

SEND FOR PRICES AND PARTICULARS.

JENNINGS' PATENT "DUPLEX" BATH-VALVES FOR HOT AND COLD SUPPLY.

Admittin' Cold Water first into Bath, economises Hot, and prevents damage to Bath or injury to Bather. Upwards of 5,000 in use.

TREES IN STREETS AND ROADS.

A REPORT has been prepared by Mr. G. B. Simpson, of Horsham, on the roadside trees at Worthing, the cutting and pruning of which have given rise to a good deal of adverse comment lately. He says that many trees were planted too closely, and others are not fit for the purpose they are intended for. These latter ought to be cut down and cleared away at once, and other trees, where necessary, should be planted in their places. It is always understood that when trees are cut or pruned it is either to attain some particular shape or for fruiting purposes, but Mr. Simpson cannot conceive for what reason the limes in Homefield Road have been cut, or what shape trees they are intended to be trained to. Some instructions, he assumes, must have been given for such wholesale slaughter, but it will, he says, take years for them to look like natural trees again. In Farncombe Road some of the trees are cut off level on top, but had each other tree been taken down and the remainder carefully thinned out, it would have been a great improvement on the present mode. The trees having been so long neglected, it requires rather drastic measures to bring them within bounds, but what shape, Mr. Simpson asks, are they eventually to be? There are but few trees, the report proceeds, except in one or two roads, at any regular distance apart. This is in some cases caused by cross-roads and entrance-gates, but the height of pruning off the branches from the ground might be uniform instead of varying, as now, from 7 to 18 feet. The roots also should be looked after; in some instances the pavement is too close to the tree and will not allow of swelling and water getting to the roots.

Passing on to give his own opinions as to how the work of planting and attending to roadside trees should be carried out, Mr. Simpson says the shape of trees for roadways should be pyramid tops on straight stems. Trees should also be trained as much as possible to copy nature, each variety having its special requirements as to pruning. No trees should be planted nearer than 25 feet apart, and should the houses be close together 35 feet apart diagonally, but discretion must always be used both in distances and the variety of trees. A birch, acacia or Cornish elm, for instance, would never spread like a chestnut, sycamore or plane, and hence would not take up the same amount of room or air space. In planting young trees choice should only be given to those trees having straight stems with perfect leaders; clean, well-grown stuff with fibrous

roots. This, Mr. Simpson says, has not been done at Worthing, and many trees lately planted are not worth the labour used or the stakes supporting them. With regard to pruning, Mr. Simpson suggests that all trees should be done twice a year. With proper tools, a little knowledge and proper instructions one can train and keep any tree in bounds, but one must start when the tree is young, and if regularly done no one will notice that they have been cut. Some of the elm trees, Mr. Simpson remarks, have been well and properly cut, but require further attention by cutting out the superfluous young shoots, and leaving only those that are required to make permanent branches.

It is not advisable to plant trees in business roads without very wide pavements, but if it is done the trees should be kept 3 feet from the kerb and protected from hungry horses, of which, Mr. Simpson incidentally observes, there must be a lot in Worthing, as there are "but few trees that have not been gnawed and damaged by them in the town." The trees suitable for road planting in Worthing, Mr. Simpson says, are elm, lime, sycamore, maple, sorbus, birch, acacia and beech, but in selecting the varieties, the position must be taken into consideration; elm will stand the most wind, and the others will do where sheltered.

CROMER CHURCH.

THE new Baptist church at Cromer, which was opened on the 1st inst., is situated between the gangway and Brook Street. The building, which is in Gothic style, makes a handsome addition to the public edifices of the town. With the space at their disposal, the architect, Mr. A. F. Scott, of Norwich and Cromer, and the contractors, Messrs. Girling & Smith, of Cromer, have put up a very ornate structure. It is built of red brick with Cossey ware dressings and slated roof. It has a street frontage of 32 feet. A pair of wrought-iron gates at the entrance lead into a small vestibule, from which access to the main building is had through folding doors at either side. This has a total length of 53 feet, with an average depth of 22 feet. Above the vestibule is a spacious gallery, with ornamental iron railing. The building has a carved panel ceiling, with a lead-glazed dome-light. There is a considerable fall in the floor, the pulpit at the far end being lower than at the main entrance. From the vestibule an iron staircase connects with the gallery. Including floor and gallery, the seating capacity is about 300. The pews

are about 15 feet long. A new feature of the seating is that down both aisles a number of folding-back seats are placed. These can be put up and down at will, and when in use there is ample space for persons to pass along. The idea originated with the builders, Messrs. Girling & Smith, who are taking steps to have the seat patented. Ordinary wood-block flooring has been laid, and the furnishing throughout is in pitch pine. The heating is done by the well-known independent dome-top boiler. The chapel is lit by four large two-light and one small three-light gas pendants. The walls are panelled with elliptical arches, and the gallery is divided from the main building by the same type of arch. The baptistery is placed between the pulpit and the first row of pews. It is approached by a flight of fine white marble steps. In size it is 12 feet long by 4 feet wide and 3 feet 6 inches deep. The sides are plain white glazed tiles, and the floor consists of ribbed glazed ones. At the front of the building are five ruby-tinted glass windows, one large and four of them small. Above the entrance are the words, "The meeting house of the Baptist Church." At the rear, connecting with Surrey Street, is the vestry, and above rooms well adapted for Sunday-school work.

THE WARRINGTON WATER SUPPLY.

MR. JAMES DEAS, the Warrington water engineer, has made the survey and completed the designs for the proposed Daresbury storage reservoir. In an exhaustive report he points out that the present trade supply is derived from the Appleton reservoir, which has not anything like sufficient capacity to store all the water flowing off its own watershed of 520 acres. The Appleton reservoir is supplemented by the discharge from a catchwater conduit tapping an additional area of 820 acres of the watersheds of the Daresbury and Hatton brooks, so that it will be seen that during the winter the supplementary supply merely passes over the waste weir of Appleton reservoir as flood water. The supplementary conduit being rather leaky, there is a risk of that supply not being fully available. The Appleton reservoir, constructed with a capacity of 62,000,000 gallons, is much silted up, and as part of the water cannot be drawn off, and the bank is not perfectly sound near top-water level, the available capacity does not exceed 50,000,000 gallons. They were now working above the real capacity of the works. The Corporation executed an agreement with Sir Gilbert Greenall for the construction of a reservoir on Danesbury Brook, and he (Mr. Deas)

recommends the construction of the reservoir for the following reasons:—

(a) The water to be obtained is particularly valuable for various purposes required by manufacturers, for which purpose Winwick water is most unsuitable; in fact, manufacturers will not use Winwick water at all.

(b) The Appleton works are at present discharging at their maximum capacity, and, with the increase of the town, will soon be unable to cope with the demand; and as the new reservoir will take four years to construct and one year to fill with water, and it will be one year from this date before it can be commenced—making a total delay of six years—it is imperative that extensions of the supply be made at once.

(c) Under the agreement with Sir G. Greenall, the reservoir must be completed by 1907.

If the construction is delayed for any length of time the Corporation would be put to enormous expenditure for the complete overhauling of the Appleton reservoir, construction of additional filter beds, alterations on the distributing main in the town, and other improvements. The capacity of the proposed reservoir would be about 190,000,000 gallons, and the cost is estimated at 70,000*l*.

The water committee have resolved that the report and plans be adopted, and the matter will come before the Council for confirmation.

CHATHAM DOCKYARD.

THE Admiralty have under consideration an important scheme for constructing a new basin at Chatham on a considerable scale, for the better accommodation of the warships attached to that port. The site provisionally selected is on the north side of the fitting-out basin, and communication with the river Medway could be easily effected. Each of the three basins already in existence has a water area of about 26 acres, but the accommodation thus provided is altogether inadequate, and has been found necessary to moor certain of the ships in some of the reaches of the Medway. Recourse to this makeshift has proved unsatisfactory, and is objected to by the shipping using the river—hence the project for constructing a new basin of much greater capacity than either of those now existing. The new basin, which will have a water area of about 60 acres, will probably be included in the next Navy Estimates.

The authorities are greatly disappointed about the new dock at Chatham, which it was expected would be completed

very shortly. The delay, however, has been quite unavoidable, and arose from circumstances which could not be foreseen. Instead of being able to concentrate their attention upon the completion of the dock, the contractors have for several months been compelled to virtually restrict their energies to the task of repairing the wall of the adjoining basin. The "blow" in this wall caused the new dock to be flooded, and in order to stop it it has been found necessary to construct an additional dam right out round the defective portion of the wall; to cut what is technically known as a "grip" right through the wall itself and to close pile it. The object of the piling is to prevent the water getting through beneath the foundations of the wall. The work has been of a most difficult nature, and has been mostly performed by divers. The water in the dock has been gradually lowered by means of powerful pumps, but no attempt will be made to clear it altogether until the "blow" has been effectually stopped.

Directly the new dry dock is finished, another one will be begun. The necessity for docks 600 or 700 feet in length is very pressing. At the present time there is only one dock at Chatham Dockyard capable of receiving vessels 440 feet in length, the other three docks being only able to take in vessels 405 feet in length.

Whilst accommodation is being provided at Chatham for the reception of battleships and first-class cruisers of the largest type, the Admiralty have also furnished the means for producing these giant ships. A new building slip has been constructed, with machinery shops and storehouses, and will be ready for use directly the huge derricks now being erected are in position. Labour-saving machinery of the most improved pattern has been installed in the shops, and the motive power will be electricity. The total cost of the new building slip and its adjuncts and accessories has been about 150,000%.

HEAT RESISTANCE OF BUILDING MATERIALS.

At the recent meeting of the American Society of Mechanical Engineers a paper was presented by Mr. William Kent proposing the use of the reciprocals of the values of heat conductivity of substances in order to facilitate the comparison of different combinations of the substances. As stated in the report of the convention, he makes the co-efficient of heat resistance or heat insulating power of a substance equal to unity divided by the number of British thermal units trans-

mitted in one hour by a slab 1 square foot in area and 1 inch thick per degree Fahrenheit of difference of temperature between the two faces of the slab, both surfaces being exposed to still air. In this way the total resistance of a combination can be indicated by the addition of the several resistance co-efficients. The author points out, however, that while the co-efficient is thus a constant quantity for a given substance, it can only be so considered when the differences in temperature of the air on the two sides of the slab are small—say, less than 100 degs. Fahr. When the temperature range is great, experiments on heat transmission indicate that the quantity of heat transmitted varies not directly as the difference in temperature but as the square of that difference.

The question of the effect of surface resistance when the surface is in contact with air or with another body, the author treats as follows:—"Authorities on the subject of heat transmission generally agree that the resistance to the passage of heat through a plate consists of three separate resistances, viz. the resistances of the two surfaces and the resistance of the body of the plate, which latter is proportional to the thickness of the plate. It is probable also that the resistance of the surface differs with the nature of the body or medium with which it is in contact. Thus a very rough surface on a metal plate would be likely to transfer more heat to adjacent air than a smooth surface would, since it has a greater area in actual contact with the air, while two rough surfaces of metal touching each other would transmit from one to the other less heat than two smooth surfaces."

He has computed the figures for heat resistance of several insulating substances from the figures of conducting power given in a table published by Mr. John E. Starr in a paper on "Insulation for Cold Storage," published in *Ice and Refrigeration* for November 1901. Mr. Starr's figures are given in terms of the British thermal units transmitted per square foot of surface per day per degree of difference of temperature of the air adjacent to each surface. The author's figures, the co-efficients of heat resistance, given in the second column of the accompanying table are calculated by dividing Mr. Starr's figures by 24, to obtain the hourly rate, and then taking their reciprocals.

"Analysing some of the results given in the last column of the table, we observe that, comparing Nos. 2 and 3, 1 inch added thickness of pitch increased the co-efficient 0.74; comparing Nos. 4 and 5, 1½ inches of mineral wool increased the co-efficient 1.11. If we assume that the 1 inch of mineral

wool in No. 4 was equal in heat resistance to the additional $1\frac{1}{2}$ inches added in No. 5, or 1.11 reciprocal units, and subtract this from 5.22, we get 4.11 as the resistance of two $\frac{7}{8}$ -inch boards and two sheets of paper. This would indicate that one $\frac{7}{8}$ -inch board and one sheet of paper give nearly twice as much resistance as 1 inch of mineral wool. In like manner any number of deductions may be drawn from the table, and some of them will be rather questionable, such as the comparison of No. 15 and No. 16, showing that 1 inch additional sheet cork increased the resistance given by four sheets 6.67 reciprocal units, or one-third the total resistance of No. 15. This result is extraordinary, and indicates that there must have been considerable difference of conditions during the two tests."

Heat Conducting and Resisting Values of Building Materials.

Fireproof construction, floored over:—

	Cond.	Res.
As flooring	0.124	8.06
As ceiling	0.145	6.90
Single window	1.030	0.97
Single skylight	1.118	0.89
Double window	0.518	1.93
Double skylight	0.621	1.61
Door	0.414	2.42

The author has also calculated the co-efficients of heat resistance from the heat transmission figures of various building materials, as given by Mr. Alfred R. Wolff, based on German experiments. These values are reproduced in a table herewith, the first column giving the conductance in British

thermal units per hour, and the second, the reciprocals, or heat resistances. It will be noted that there is an irregularity of the differences in the value of the resistance for each increase of 4 inches in thickness of the brick walls, which the author holds to indicate a difference in the conditions of the experiments. He finds the average difference is 0.80, and that the approximate formula for the resistance is $0.70 + 0.20 t$, in which t is the thickness in inches. In the third and fourth columns are given the revised values of the resistance and conductance respectively, ascertained in accordance with his formula:—

Heat Conducting and Resisting Values of Different Insulating Materials.

	Conductance.	Resistance.

The Architect.

THE WEEK.

A NEW departure in the history of the Royal Institute was witnessed on Monday last, when the President, Mr. ASTON WEBB, was "At home" to a thoroughly representative gathering of members, from the oldest of Fellows to the most recent of Associates. Members of the Royal Academy and high-art men, district surveyors and quantity surveyors, specialists and general practitioners, City men and provincials, every shade of architectural activity to be found in the membership of the Royal Institute were present. To afford an opportunity for social intercourse amongst the members was the avowed object of the new President, and most successfully and completely was this object attained. The rooms were filled to their utmost capacity, friends and acquaintances who had met in the past in the classroom, the studio, the Academy schools, again clasped hands and revived the memories of auld lang syne. The isolation that is, for the most part, the general experience of the architect in his everyday life was exchanged for the delights of companionship and good fellowship. The entertainment was of the simplest character, light refreshments and tobacco, and a deeply interesting collection of drawings of the late Mr. J. F. BENTLEY were all the extraneous adjuncts of the function—no band, no speeches, no formal reception were needed to supplement the camaraderie that was the keynote of the evening. Every one seemed to meet some one with whom to chat, no one seemed bored, all were contented and happy. Such meetings as this should go far to establish that *esprit de corps* which is so eminently desirable in the architectural profession, and if this is reached, the presidency of Mr. ASTON WEBB should be marked *cum creta alba* in the annals of the Royal Institute.

It is hardly to be expected that a young sculptor, although he may be only an apprentice, will have the deliberation of the ordinary working man. Rashness in such cases may be condemned, but it must also be deplored. Last May an apprentice to Mr. JOHN S. RHIND, the architectural sculptor, was engaged in carving at a new bank in Edinburgh. His field of operation was on the upper part of the building. He was not able to reach the stonework which was to be carved from the scaffold. He therefore obtained a joiner's trestle and stood on it. As it was unsteady he slipped and fell into the street, where he was fatally injured. His father brought an action claiming 500*l.* damages for his loss, and alleged that the insecure state of the scaffolding which was not protected by a caging was the cause of the fatality. It was pleaded on behalf of Mr. RHIND that a caging was not then necessary, that the scaffolding was quite secure, and that the accident arose from the deceased voluntarily putting a joiner's trestle on the platform and standing on the top of it, instead of waiting until the foreman properly raised the scaffold. The case was heard by Lord M'LAREN, and the jury returned a verdict for the defendant, Mr. RHIND. The young man's fate should be taken as a warning, for as sculpture is coming into favour it will be well to avoid creating the prejudice against the art which arises from fatal accidents.

As Irish gentlemen were never remarkable for encouraging art, it is no wonder that doubts should be raised about some of the family portraits which are to be seen in the first winter exhibition in Dublin. One represents the Right Hon. ANTHONY MALONE, and is ascribed to Sir JOSHUA REYNOLDS. Two members of the executive committee, one being Mr. OSBORNE, the portrait painter, opposed its admission on the ground that it was no more than a bad copy of a faded original. Mr. LANE, who got up the exhibition, has considered it to be his duty to bring forward some evidence on the subject. According to him, the Right Hon. ANTHONY MALONE, of Baronstown, Prime Serjeant and Chancellor of the Exchequer in the Irish Parliament, died in 1776, about a year after his portrait was painted by REYNOLDS (1774-75). In his will, proved July 19, 1776, he leaves his personal estate, which included his pictures, to his nephew, RICHARD

MALONE, created Baron SUNDERLIN, who died in 1817. The latter was succeeded by HENRIETTA MALONE, of Baronstown, whose will was proved in 1825, and she in her will specifically refers to a "picture of the late Right Hon. ANTHONY MALONE," "painted by Sir JOSHUA REYNOLDS," and thereby gives her sister, CATHERINE MALONE, a "life-use" in the picture, a RICHARD MALONE to get it after CATHERINE'S death. CATHERINE MALONE in her will, proved June 23, 1831, refers to "a picture of the late Right Hon. ANTHONY MALONE, painted by Sir JOSHUA REYNOLDS." RICHARD MALONE, in a codicil, which, with his will, was proved on October 25, 1834, bequeaths all the pictures and plate left to him by Miss CATHERINE MALONE, deceased, "to his sister, ALICIA O'CONNOR, of Baronstown," who, on her brother's death, resumed her maiden name of MALONE. She in her will, proved 1866, bequeaths all her books and the pictures of the MALONE family to her cousin, the Right Hon. Colonel F. PLUNKETT DUNNE, of Brittas, Queen's County, where the picture in question was ever since hung beside the engraving by J. R. SMITH in 1778. Colonel F. PLUNKETT DUNNE was succeeded by his brother, EDWARD M. DUNNE, J.P., whose son and heir, FRANCIS PLUNKETT DUNNE, was father to the Misses DUNNE, now owners of Brittas. It is not often so circumstantial a history of a picture is to be obtained. If such evidence was always needed we are afraid there would be few winter exhibitions in Burlington House. REYNOLDS was acquainted with the MALONE family. EDMUND MALONE, the commentator on SHAKESPEARE, was one of the painter's executors, and brought out the posthumous edition of his works. There seems to be no mention of the portrait in any of the lists of REYNOLDS'S pictures which were published after his death, although SMITH'S engraving necessarily was derived from such a work.

THE announcement of openings in the Procuratie Vecchie in Venice is enough to excite a panic in the mind of the most courageous citizen. That building is so connected with others there cannot fail to be apprehension that if it should succumb various other structures on the Piazza must share the same fate. Then what becomes of the centre of Venetian life? The Procuratie Vecchie is the oldest of the buildings of the Piazza, which many of the observers consider to be only one palace. It was constructed about 1500 by BARTOLOMEO BUONO. The procurators were originally no more than the churchwardens of the basilica of St. Mark. By degrees their power was extended until they became almost like the old Chancery Court in England. They embodied the equity of the Republic. It was at one period the custom to select the Doge from among the members. In the sixteenth century it was necessary to provide further accommodation for them, and the Procuratie Nuove was commenced under the direction of SCAMOZZI; but it is believed that SANSOVINO had much to do with the preparation of the design. The ancient library which is connected with the palace was declared by PALLADIO to be the richest and most ornamented that had been erected since the time of the ancients. The Procuratie Nuove was converted into a palace when EUGÈNE BEAUHARNAIS was Viceroy of Italy. The buildings have been allowed to fall into the occupation of several people. They are not likely to leave their apartments so long as they have a prospect of compensation. At any cost repairs will have to be undertaken, and, once embarked upon them, there is no saying where they may end.

ON the 2nd inst. we referred to the efforts of the Steyning Board of Guardians to make unusually economical terms with their architects, Messrs. CLAYTON & BLACK. The subject, which was postponed for a fortnight, again came up for consideration on Tuesday. A letter from the architects was read expressing willingness to meet the views of the guardians. But the spirit of opposition which had been raised did not become quiescent. One guardian cavilled with the letter because there was no reference to other buildings than those of the infirmary, and because a price had not been named for the plans instead of the usual architects' fees. Another representative of economy maintained that they should not be tied to one firm, but eventually the letter from the architects was approved.

"ASTRONOMY."—BY H. S. MARKS, R.A.

THE ACADEMY WINTER EXHIBITION.—II.

THE three examples by JOHN SELL COTMAN in the exhibition must excite surprise when it is recalled that so able an artist was compelled to accept the position of a drawing-master, as, with all his versatility and conscientiousness as a painter, he was unable to live by his art. Could it have been that his numerous etchings of buildings made people imagine he was only an architectural draughtsman, and was therefore devoid of any colour sense or skill in composition? Every work of his which has been exhibited of late years may be regarded as a protest against the defective judgment of amateurs and the public. The first picture, *Homeward Bound*, a three-masted vessel in full sail, is so effectively foreshortened, it seems almost to be moving towards the spectators. The vessel stands out with greater force through contrast with the stormy sky in the background. His *St. Malo* is over 7 feet in height. The view was taken in the old days before the construction of the costly harbour. The fortifications are built of a reddish sandstone, and COTMAN's scheme of colour was adopted from them. He used red in the sails as well as in the boats, and for the shirts and caps of the men. It may be that so much red needs more relief than was afforded by the distant sea, for the tide is supposed to be out, but the effect is remarkably impressive. *The Heath Scene* was evidently a transcript of actuality, for the three windmills would hardly be placed so closely in a composition. The ground is suggestive of Downs thinly covered with grass: the gravel beneath is almost too emphasised in the roadways. The three works suggest how various were COTMAN's capabilities, and thirty pictures no less diverse in treatment could easily be gathered together.

There are two paintings by BONINGTON: one dated 1825 depicts a seashore with in the foreground three little children of the kind the artist was fond of representing; near them he has introduced some ducks which seem almost out of place; in the distance there is the sea with ships. In the *Boulogne Fish Market* we have an animated scene; on the left side are houses and the sea is introduced on the right. The aspect differs much from the Boulogne of the present day. BONINGTON was only twenty-eight when he died of consumption at Pentonville, but as he had the advantage of twelve years' study and practice in France, and was a favourite with GERICAULT, DELACROIX and GROS, his astonishing success may be considered less remarkable. It is curious how well he exemplifies the revolt against academicism. The approved rules for composition which then prevailed had no influence upon his works, and as one of the representatives of the principles of liberty, it is no wonder BONINGTON is so much admired by Frenchmen. There is a tendency to undervalue the works of Sir A. W. CALLCOTT, but the sea-piece which was exhibited in 1826 with the descriptive title "Dutch fishing-boats running foul in the endeavour to board, and missing the painter rope," is a masterpiece of wave-painting. He is mostly known by his Italian landscapes, and his attempts at figure-painting could not be thought successful. But the figures he introduced in his landscapes, and of which the sailors in this painting are good types, certainly did not

justify RUSKIN to say that they sicken the heart of any man who knows what figure-painting should be. JOHN JAMES CHALON has suffered through being confounded with his brother ALFRED, who was the painter of society, opera singers and danseuses. The *Gipsy Encampment* is very bold both in the trees and sky; the painting belongs to the Royal Academy. The *Baggage Wagon*, by WILLIAM J. MÜLLER, was one of the last works produced by him. Like BONINGTON, he was a young man, for he was only thirty-three at the time of his death. He promised to be a second CONSTABLE, and this picture might be compared with the *Opening of Waterloo Bridge*. The title hardly indicates the variety of work which is in the painting. In MÜLLER's time soldiers wore white trousers in addition to red coats, and we see some companies of them marching along a road through a flat country, women and stragglers being found in the waggons. In spite of so much red the scene is dreary, and the rainbow in the sky indicates the character of the weather. MÜLLER's *Eel-Bucks at Goring* is not complete, for he wrote on the back, "Left as a sketch for some fool to finish and ruin;" but few would care to see it touched. Here again he introduces a stormy sky and rainbow. The scene is painted with great vigour, and it has all the characteristics of the topography of the place. CRESWICK's *Haunt of the Kingfisher* is a rocky pool overhung with foliage, and on one of the stones a bird stands; it was painted in 1847, when the artist was in his prime. He succeeded in what he attempted; the spot is confined, for it is one which an amateur photographer would select. Sunlight is only suggested by glints of light on the stones, but the treatment imparts an air of reality to the pool which might be impossible if a larger expanse had been introduced. It is doubtful whether any admirer of the water-colours of DAVID COX would at first sight recognise *The Vale of Clwyd, North Wales*, but in 1849 he may be said to have abandoned his old methods for oil-painting. It is a large canvas measuring 36 by 55 inches, is carefully painted, and the picture is in fine condition. But somehow it does not suggest the boldness of treatment which is associated with the artist's name. The portrait of JOHN GIBSON, the sculptor, by Sir EDWIN LANDSEER, suggests the dreamer and the silent oracle who used to listen so quietly to the disquisitions on art by his young rivals in Rome. Of the two works by DE LOUTHÉBOURG *The Wreck* is the more striking, although the rocks are conventionalities and the waves are foam and fury.

Four masters of the British Schools lately deceased are allowed the water-colour room and the black-and-white room. By JOHN BRETT there are ten paintings. He is not one of those artists whose reputation can be increased by an assemblage of his works. He prided himself on his geological knowledge. A granite islet, with the sun shining on it and a clear blue sea around, when painted by him is a pleasing picture. But to see granite islet after granite islet does not add much to our pleasure. JOHN BRETT rarely cared to paint rocks which were black, although they possessed much interest. When it was arranged to exhibit his works care should have been taken to obtain some of his inland scenery.

By the late HENRY MOORE there are also ten paintings. As an artist he likewise had his limitations. The sea to him must always be of a peculiar blue colour, and it is astonishing how little variation there is to be seen in the character of his waves. It might easily be concluded that he never was at sea in dirty weather, and the Channel passage, although he might select the long route from New-haven to Dieppe, was restrained on his behalf. Those who are familiar with his sea-pieces will find much pleasure in his flower study of chrysanthemums, in his Glenorchy, and especially in his Highland cattle. The artist was likely to have derived enjoyment from the change, although patrons might insist on sea-scapes.

There are five examples of the late VICAT COLE, three of them being subjects derived from the Thames Valley, and the two others cornfields in Surrey. They are typical works, although they are not of the size of the more ambitious productions of his later years.

The most interesting examples are those by the late MATHEW RIDLEY CORBET. He was not adequately appreciated during his lifetime, and the paintings are evidence of the ability of the man to whom compensation is no longer possible. They are mainly Italian scenes. In style they are unlike the majority of the Italian landscapes which during a long course of years have been shown in English galleries. RIDLEY CORBET knew the preconceived ideas which people had about Italian characteristics, but he was indifferent to them. No painter, for instance, before him suggested that in Italy there existed pools surrounded with rushes, or that houses might be little better than boxes in shape. The studies in the black-and-white room will suggest the pains taken by him to insure accuracy in his paintings. His landscapes are so fresh we hope that any which are for disposal will be acquired for English public galleries. They are among the chief attractions of the winter exhibition, and by themselves are sufficient to repay frequent visits.

THE ARCHITECTURE OF GREECE AND ROME.*

EVERY reader of "The Architecture of the Renaissance in Italy," by the late WILLIAM J. ANDERSON, is likely to feel regret on taking up the companion volume on Greece and Rome, which he did not live long enough to complete. Mr. PHENÉ SPIERS is no doubt more than competent to take Mr. ANDERSON'S place, since he possesses a longer acquaintance with Classic architecture than his friend, whom he aided, as many others, as a guide. But it can never be expected that a book which to a large extent is marked by the idiosyncrasy of the writer can retain its original character in the parts which are inspired by a mind of a different class. Mr. ANDERSON could not be accepted as a matured authority on the art of the past. Indeed, one of the charms of his writing for students is to be found in the circumstance that he was essentially a student and made no pretensions to his own infallibility. In the introduction, for instance, to the second edition of his book on Italian Renaissance, he says:—"In the interval that has elapsed since I first wrote on the subject, not only has my point of view changed, but light from the study of kindred subjects has been shed upon it, so changing its aspect to myself that I felt inclined to rewrite the whole book, or, at all events, parts of it." He stayed his hand, however, as he feared that the book would lose its peculiarity as a record of impressions at a particular period of mental growth. So honest an acknowledgment was not without its use. It is well for a student of architecture to learn from the example of his teachers that changes of opinion about the art are inevitable with all who are likely to be competent to make advances, for no men are so little entitled to be considered as its representatives as those who insist on adhering to the routine of their days of apprenticeship and who believe that the notions then acquired are to be taken as universal dogmas.

For men who adopt such narrow views it may be doubted whether there is much advantage in having histories of architecture. During many years in England stereotyped forms were insisted on both by Classicists and Mediævalists because they were supposed to be warranted by historical evidence. Neither side would be willing to accept the theory advanced by DIGBY WYATT when he wrote, "All that human art has ever produced constitutes, as it were, a crude ore which must be submitted to the process of 'cupellation' before the pure and standard metal, the only menstruum for the future, can be satisfactorily evolved." WILLIAM ANDERSON was no less confident that history should not be regarded as a treasury of ready-made formulas which were to be acted upon with scrupulosity, as if to add to them or to take from them was a crime. As he declared, "If things do not happen fortuitously, the larger architectural design is not yet complete. . . . The nature of things that has made of the art manifestations of Greece and Rome and the Middle Ages, which at their moment of inception were apparently matters of caprice, accident, or at the most skilled human judgment, permanent facts moulding the whole course of the art expression of the Western world, continues to operate with cumulative purpose. . . . If there be confidence in human progress, advancement in the quality of the intellectual productions is implied, and whatever be the chaos and ruin in which we yet grope, the arts must one day give evidence of that progression." We find him also taking a sober view of the conditions under which art was pursued at various times. It has been often wished, and is so still, that we could get back such opportunities as existed in Florence for creating many-sided or universal artists, as if to be a specialist was little more than an artifice. Mr. ANDERSON when writing about BRAMANTE offered the following remarks:—

Architectural power seems from his days to have passed into the hands of the painters, who soon outnumbered the sculptor-architects of the Florentine school. This was not without its effect upon the art, and arose in part from the fictitious importance given at the time to the science of perspective, in which the painters were naturally more proficient. Not that it signified much in itself whether the way to the practice of architecture lay past the painter's easel or through the sculptor's "bottega," so long as the man qualified himself as an architect. It would be a mistake to suppose that, because a few of the greatest architects the world has seen found their way through the painters' and sculptors' studios, that therefore such a training must, at any period, best fit one for the work. These particular cases only show that special capacity under favouring circumstances will assert itself and find its true outlet. Many painters and sculptors of the era made poor architects, and hundreds of them never indicated any architectural skill whatever. The best of the architects were those who laid everything aside for their art, and became no longer painters and sculptors, but architects. It was so with Brunelleschi, and Bramante, too, seems to have laid aside his palette to give all his energy to the building art.

As the series of lectures began with those on the Italian Renaissance, we should have expected that the next series would treat of the works which were adopted as models by the Italians of the fifteenth century. They knew little of Greece, except from descriptions in ancient authors or those given by Greek scholars who found their way to some of the cities of Italy. One of WILLIAM ANDERSON'S expressions might be interpreted as meaning that we also had a peculiar interest in Roman work. According to him "we are all Romans, as our language, religion and law, as well as our arts, remind us; and have besides a large community of interest with the country which has been the leader and teacher of civilisation to modern Europe." He was not, however, destined to deal with Roman architecture in the manner he desired. So many remarkable discoveries occurred in Greece, it is not surprising that the Governors of the Glasgow School of Art, in which he lectured, should wish to see precedence given to Greek architecture. There was another reason which would be almost sufficient to cause a change in Mr. ANDERSON'S arrangements. Believing in the power of circumstances or conditions of time and place, he would be desirous of explaining how far adaptability prevailed in Greece. As he said, nothing is more likely to wean the architectural student from the misuse or feeble copyism of characteristics than

* *The Architecture of Greece and Rome.* A sketch of its historic development. By the late W. J. Anderson and R. Phené Spiers. (London: B. T. Batsford.)

a grasp of the relation of their surrounding circumstances. Hence, he added, "buildings in their plan and design, rather than their details or furnishings, will be studied. Architecture is more than pottery or painted decoration—the work of a nation, the symbol of a religion, the house of gods and man, greater than the idols and ornaments therefore." His aim was, however, only partially realised. He was able to treat of the Mycenaean Period in Greece, the Archaic Period in European Hellas and in Asia Minor, with the culmination in Athens. But, says Mr. PHENÉ SPIERS, "for the descriptions of the monuments in the fifth, sixth and seventh chapters on Greek architecture, for the Etruscan, and for the whole of the Roman architecture, I am entirely responsible."

By starting with Mycenaean art the difficulty of dealing with the earlier mythical period is overcome. At the time of writing the importance of Crete had not been demonstrated. The daring restorations of CHIZEZ are adopted. It is stated that the debt to the Mycenæans includes the antæ of the Greek temple and the inclined sides of the doorways, "while the fluting of the columns, the triglyph frieze, the patera, the rosette, the palmette and the spiral all are forms upon which the later Hellene has got to exercise his refining genius and hand down ennobled to later generations."

It is assumed that the megaron of Tiryns was the first type of the cell or shrine of the god, and that next a peristyle was built around it. The massiveness of the early columns is ascribed to timidity as well as ignorance of the strength of stone in supports. It is not suggested that the Ionic order is regarded as subsequent to the Doric on account of age. Both originated in Mycenæ. But one or other was preferred according to the social character of the temple builders. Concerning the Ionic capital we are told:—

One thing seems plain, that the further we go back in our study of the Greek Ionic Order the more probable appears the theory of a wooden origin, the spirals being painted or scratched on to the block which distributed the load, and the archaic spirals recently discovered at Athens, and now in the museum of the Acropolis, would all seem to bear out the theory, being simple masses or blocks, with the spiral traced or painted on. In some of the early Ionic capitals the volute and the echinus moulding are carved out of different blocks, the latter, exemplified in the archaic temple at Samos, being, in fact, the crowning moulding of the shaft, and carved out of the upper drum of same. In later developments the echinus is partially sunk in the cushion of the volute, as is the case with the capital now in the British Museum which belonged to the archaic Temple of Diana at Ephesus. In this case the bead only is carved out of the shaft block. This capital shows the undeveloped nature of the spiral bead of the volute, of the palmette ornament which marks the junction of the volute and the echinus, and of the carved egg-and-tongue. The peculiar design of the latter, however, and the fact that its upper portion recedes, suggests a different origin from that hitherto assumed, viz. that the ornament which in the Doric capital was painted, in the Ionic was carved.

There is a variation in treatment in the parts undertaken by Mr. PHENÉ SPIERS, which relate to Greece, Etruria and Rome. He rarely attempts summary views or conclusions. A large number of buildings are discussed separately, and much information has been gathered in order to enable the reader to realise their character. The restorations by prizemen of the Ecole des Beaux-Arts have been utilised in many instances. Besides serving the particular purpose as attempts to suggest the appearance and arrangement of famous structures, they will also help many people to understand a branch of architectural study which is not attended to in this country. Mr. ANDERSON'S work served as popular lectures in the first instance, and had therefore to be general, or it may be comprehensive, in treatment. Mr. PHENÉ SPIERS, having more experience with professional students, has been able to enter on details which would be out of place in an ordinary School of Art. For the same reason in describing Rome a chronological basis has been avoided. The different kinds of buildings are treated separately, such as forums, temples, basilicas, amphitheatres, baths, gateways, triumphal arches, aqueducts, palaces, &c. The latest discoveries in Rome are described. An extract will suggest Mr. SPIERS'S manner of treatment. On the subject of the Colosseum, he writes:—

The exterior is divided into four storeys, the three lower ones with arcades, the walls between being decorated with the Tuscan, Ionic and Corinthian orders. The upper storey is unpierced except by small windows lighting the corridor underneath the upper range of seats or gallery, and its wall is decorated with Corinthian pilasters on lofty pedestals superimposed on the other orders below. Above the windows are three projecting corbels in each bay to carry the masts of the velarium, which rise through the cornice. The proportion of the lower order is poor and meagre, the column being nine diameters high and seven and a half diameters centre to centre. In consequence of the height of the vault over the ground floor corridor, the pavement of the corridor above is raised considerably above the cornice of the order, and an attic or dado is introduced, the cornice of which ranges with the first floor level; a similar arrangement exists on the upper floor. Under the columns the mouldings of the dado return on each side and constitute pedestals. It may be in consequence of these that the Ionic column is only eight and a half diameters in height, as also the Corinthian columns above. The results are very fine, and compensate for the pooriness of the ground storey. In consequence of the necessity for some protection to the first and second-floor corridors, solid balustrades are carried within the imposts of the arcades. The whole of the masonry is laid without mortar; the architraves are all vousoired and carried back into the solid wall. The complete entablature of each order is carried round without a break, and this and the sturdy nature of the semi-detached columns give a monumental effect to the Colosseum which it would be impossible to rival. The applied decoration of the orders, their superimposition and the jointing of the architraves in principle are all wrong, and should be condemned, but the portions of the external wall which remain, rising to their full height of 157 feet, and the splendid nature of the masonry, disarm all criticism and constitute the Colosseum as one of the most sublime efforts of Roman architecture.

It will be observed that in this description Mr. SPIERS does not hesitate to express unfavourable opinions on the character of the design whenever they are called for. The frieze of the arch of SEPTIMIUS SEVERUS is objected to for its want of depth in the frieze, by which the whole entablature seems to consist only of mouldings. The curious Silversmiths' Gateway is said to be one of the most debased conceptions of the period. On the other hand, features which are often overlooked in descriptions of Roman buildings are carefully noted. Much has been written about the Arch of Janus, because it consists of a double arch recalling the temple of the gods in the Forum. But M. CHOISY was the first to explain how the same centreing must have been used for both the intersecting groins. "These groins were each built in two rings of Roman bricks. As soon as one of them had set the hollow space between the two rings was filled in with concrete, and the centreing having been shifted round, the other double ring was constructed, butting on each side against the first groin." Throughout the chapters on Rome care is taken to give as much information as possible about methods of construction. The subject of planning also receives attention. In RICHARD BURGESS'S volumes on Rome there will be found a finely engraved plan of the Baths of Caracalla; it corresponds with one in Dr. MIDDLETON'S book which is reproduced in the volume before us. But the assignment of the different chambers is altered, and a comparison of the two will suggest various archaeological problems. The elaborate plan of the Palace of the Cæsars, by M. DEGLANE, is also suggestive of another most difficult restoration which still awaits solution. Several archaeologists have attempted to throw light on the subject, but without success. M. DEGLANE has had advantages which were possessed by none of his predecessors, for important excavations have been carried out during the past forty years on the Palatine Hill. But Mr. SPIERS has to say "the ingenious way in which the rooms vary in their form and proportions would be of greater interest if we knew for what purposes they were used, and how they were lighted; and the same applies to those of the northern portion of the palace, the most singular features in which are the narrow passages (fauces) between the chief reception halls." In many accounts of Roman buildings it has been taken for granted that imagination is to be allowed exercise. But in the chapters of the latest volume on them care is taken to point out the true character of the evidence.

There are 179 illustrations, and not a single one can be found fault with as either careless or unworthy of its pur-

pose. As representing the architecture of Greece and Rome they possess incomparable interest, and the consideration of them alone apart from the text is an intellectual treat. That such a work can be produced is a sign of the earnest interest which is now taken in architecture, and that interest must be still further expanded by Messrs. ANDERSON and SPIERS'S volume. It is such a work as many students of architecture and the Classics have vainly yearned for, and lost precious years in supplying its place.

THE ENCYCLOPÆDIA BRITANNICA.*

THE first article in the ninth volume of the new issue of the "Encyclopædia Britannica" which will engage the attention of men who have an interest in construction will be Professor EWING'S on the Strength of Materials. In it he describes some late forms of testing machines, but he adds that "of all recent aids to a knowledge of the structure of metals and their behaviour under stress perhaps the most important is microscopic examination." In declaring this the Professor is adopting the views of Dr. H. C. SORBY, who was often president of the Geological Society, and whose opinions about the structure of rocks were considered as impracticable. Strange revelations have been made in examining metals, one being the formation and growth of crystals. Professor EWING says:—

In many metals, however, a further effect of severe strain is to develop twin crystals, and this implies a rotation of one group of elements through a definite angle with respect to the other elements of the same grain. Excessively severe straining, as, for instance, the squeezing of a block of lead into a thin flat plate, is found to produce a crystalline structure in which the grains have a greatly reduced size; the slips have in that case gone so far as to cause divisions and interpenetrations of the crystals. Microscopic examination further shows that after severe straining the structure of a metal is far from stable, a fact which connects itself with what is observed in respect to mechanical quality. In some metals at least, and notably in lead, severe straining is followed, even at atmospheric temperatures, by a protracted crystalline growth which results in the formation of crystals which are relatively very large. A piece of ordinary sheet lead shows the effect of this growth well; it will be found, when etched, to consist in general of crystals enormously larger than any that could have survived the process of manufacture by rolling. A similar growth may readily be traced from day to day or week to week in a piece of lead which is kept under observation after being severely strained. The process of growth is greatly accelerated by raising the temperature. That some process more or less analogous to this goes on in iron and steel during the change which occurs when elastic recovery takes place after over-straining may be conjectured, though there is as yet no direct evidence on the point.

The microscope has demonstrated that metals used in construction should not be treated as homogeneous. They are made up of granules. The danger of the presence of sulphur in iron and steel by causing brittleness is manifested when it is seen that the sulphur finds its way between the grains, and thus breaks the cohesiveness.

There is a science also which relates to social cohesion which is no less important in construction, for the strongest materials will not serve if workmen are impracticable. In dealing with the subject of Strikes and Lock-outs, the author narrates cases where time and money were wasted, but happily he has to go back for some years to discover instances connected with the building trades which have caused much loss. In 1859-60, 1861-62 and 1872 there were strikes of building operatives in London. But the strike of 1891 among the carpenters, although it lasted twenty-four weeks, was unsuccessful.

It is shown by the article on Wages that increases have been allowed in the building trades in most parts of the world. In January 1886 the average weekly wages of carpenters and joiners in this country was 31s. 8d. and in July it was 31s. 2d. In 1891 the amounts had increased respectively to 33s. 9d. and 35s. 3d. In the United States

statistics have been collected for several years. In 1790 the pay of carpenters was 60 cents a day, in 1800 it was 70 cents, in 1810 1'09 dols., in 1820 1'13 dols. and from 1830 to 1840 1'40 dols. was the average. It was not until 1860 that carpenters received 2'03 dols. In one New York establishment the pay of carpenters was in 1843 1'50 dols. and in 1891 it had reached 3'50 dols., while the hours were reduced from ten to eight. The present pay for carpenters in Chicago and many other cities is said to be 3'40 dols. a day, but the prices for skilled workmen vary. While 4 dols. may be paid to a carpenter in a large city, he will receive not more than 2'50 dols. in a town in the vicinity. French carpenters outside the Department of the Seine in 1853 received 2'20 frs. a day, in 1874 the pay was 3'45 and in 1892 4'32. According to another official publication the wages in Paris of carpenters rose between 1875 and 1887 from 5 frs. to 7'50 frs. In 1806 the pay per hour was '30, in 1899 it was '90 fr. In Berlin the carpenters received 18 marks per week in 1802, and in 1891 the sum had grown to 24 marks. In Austria in 1894 the carpenters were paid 25'50 crowns. It is pointed out that in continental countries employers give gratuities, prizes, supplies, which have a tendency to lower wages.

The article on Surveying is divided into three parts—methods and instruments, geographical, and nautical. Allied to it is tacheometry, in which a large amount of work can be executed without the aid of a chain or tape. Photographic surveying has also been used with success in countries like Canada, where great stretches of land have to be reckoned with. Titan cranes, which are so advantageous in the construction of breakwaters and harbours, are described by Mr. W. PITT, C.E. There are two types, according to the way in which the horizontal arm is supported. Mr. PITT considers that "for loads over 40 tons combined with a radius of over 75 feet the cantilever type would now be more generally adopted." It seems almost incredible that marine works could at one time be constructed without their aid. The Titans enable such enormous blocks of stone or concrete to be used that the action of the waves against them is of little account.

Mr. G. F. DEACON contributes the article on Water Supply. As the engineer of the works for the supply of Liverpool he has had experience on a large scale. In the Vyrnwy Dam clay slate of the Lower Silurian formation with an ultimate crushing strength of from 700 to 1,000 tons per square foot was used, with Portland cement mortar and concrete in the joints. Some of the stones weighed 8 or 10 tons; those near to the water face were laid in finer mortar, and great care was exercised to make the joints impermeable. A few years ago a dam failed near Epinal through slipping, and many lives were lost. We are told "it is probably the only instance in which a masonry dam has slipped upon its foundations, and also the only case in which a masonry dam was actually overturned, while curiously enough there is every probability that the two circumstances had no connection with each other." Some of the blocks of masonry which were carried down the stream weighed several hundred tons. For purification on a large scale and without extravagant cost Mr. DEACON believes there is no material known which will supersede fine sand filtration if properly conducted.

Mr. F. FOX, the author of the article on Ventilation, is an advocate for the employment of mechanical force. In the ventilation of all large buildings three points have to be considered—the area of the floor to be provided for each person; the cubic capacity of the room required for each occupant; and the number of cubic feet of air per minute which must be brought in and then extracted for each individual. The following extract is given from the United States Text-Book on School Architecture:—

The amount of fresh air which is allowed to hospital patients is about 2,500 cubic feet each per hour. Criminals in French prisons have to content themselves with 1,500 cubic feet per hour. Assuming that we care two-thirds as much for the health of our children as we do for that of thieves and murderers, we will make them an allowance of 1,000 cubic feet per hour, or about 16 cubic feet per minute. Forty-eight children will then need an hourly supply of 48,000 cubic feet. Definite provision must therefore be made for withdrawing this quantity of foul air. No matter how many inlets there may be, the fresh air will only enter as fast as the foul escapes, and this can only find an outlet through ducts intended for that

* The new volumes of the *Encyclopædia Britannica*, constituting in combination with the existing volumes of the ninth edition the tenth edition of that work, and also supplying a new, distinctive and independent library of reference dealing with recent events and developments. The ninth of the new volumes, being volume xxxiii. of the complete work. (Published by the *Times*, London.)

purpose, porous walls and crevices serving in cool weather only for inward flow. What then must be the size of the shaft to exhaust 48,000 feet per hour? In a shaft 20 feet high, vertical and smooth inside, with a difference in temperature of 20 degrees, the velocity will be about $2\frac{1}{2}$ feet per second, or 9,000 per hour; that is, it will carry off 9,000 cubic feet of air per hour for every square foot of its sectional area. To convey 48,000 cubic feet, it must have a sectional area of $5\frac{1}{2}$ square feet.

An article on Ancient Troy, by Mr. D. G. HOGARTH, summarises the results of the recent explorations. It is admitted that no site can be brought into complete accordance with the topography suggested by HOMER. No less than nine settlements have been found superposed at Hissarlik. The first was a primitive settlement probably dating from the dawn of the Bronze Age; the second shows structures of various periods. It was supposed by SCHLIEMANN to be the Homeric Troy. In 1893 remains were discovered of structures which appeared to be contemporary with those of Mycenæ, and which are therefore more likely to be PRIAM'S Troy. Then followed a small settlement "which maintained itself all through the Hellenic age, till the Homeric enthusiasm of ALEXANDER THE GREAT called a city again into being on Hissarlik."

As usual, biographies of artists are interspersed with political, social, scientific and other articles. One architect, but an eminent one, is recalled, viz. Mr. ALFRED WATERHOUSE, who was born in Liverpool in 1830. He was a pupil of RICHARD LANE in Manchester. In 1859 he won first place in the competition for the Manchester Assize Courts, and in 1868 he carried off the prize for the Manchester Town Hall competition. In 1876 he was entrusted with the new buildings for Balliol College. In his mid-career, it is said, his style was "Gothic tradition—European rather than British—tempered by individual taste and adaptation to modern needs." The list of his works is remarkable not only for number but diversity. There is a sympathetic notice of Mr. G. F. WATTS, who was born in London in 1817, and was an exhibitor at the Academy as early as 1839. He won one of the prizes for the decoration of the Houses of Parliament in 1842 by his *Caractacus*, and in 1846 a first-class prize of 500*l.* for his "ALFRED inciting his subjects to prevent the landing of the Danes, or the first naval victory of the English." This last picture was described by THACKERAY as having more wind than any other picture in the world, and he good-humouredly wrote, "It is blowing everywhere and from every quarter. It is blowing the sail one way, the royal petticoat another, the cloak another, and it is almost blowing the royal hair off His Majesty's head." Mr. WATTS had to wait until 1867 for election as an Associate of the Academy. But in the course of the year he became an Academician. He has set forth his aims as follows:—"My intention has not been so much to paint pictures that charm the eye, as to suggest great thoughts that will appeal to the imagination and the heart, and kindle all that is best and noblest in humanity." Justice is also done to Mr. WHISTLER'S ability. It is stated that "in the future WHISTLER must be accounted, in oil-painting, a master exquisite, but rare. But the number and the range of his etched subjects, and the extraordinary variety of perception and of skill which he has brought to bear upon the execution of his nearly three hundred coppers, insure, and have, indeed, already compassed, the acceptance of him as a master among masters in that art of etching." Sir JOHN TENNIEL is another of the artists who find a place in the volume. A reproduction is given of one of his most successful designs, *Dropping the Pilot*. The masterly drawing of the numerous cartoons becomes more remarkable when it is known that for the figures the model was never used, and that the "wonderful observation has been conducted and his knowledge accumulated literally through a single eye, the other having been lost during a fencing bout in his youth." Notices are also given of several foreign artists.

The "Encyclopædia Britannica" has to comprise an universality of subjects. It is a severe trial of such a work to select the parts which can have professional interest for readers of the classes represented by this Journal. JOHNSON considered the omission of many terms of art and manufacture from his Dictionary was unavoidable, for, as he

excused himself by saying, "I could not visit caverns to learn the miners' language, nor take a voyage to perfect my skill in the dialect of navigation, nor visit the warehouses of merchants and shops of artificers to gain the names of wares, tools and operations." But those who consult a modern encyclopædia cannot or will not make allowances for the difficulties of acquiring information. The notices we have given may be considered as tests, and demonstrate that classes of subjects more difficult than those referred to by JOHNSON are treated with as much care as if they formed the essential parts of the "Encyclopædia Britannica."

THE EXCAVATIONS AT BURY ST. EDMUNDS*

LAST week we referred to the discovery of human remains beneath the floor level of the chapter-house of the Abbey of St. Edmundsbury. Sir Ernest Clarke, having examined them, gives the following description in the *Times*:—

Jocelin de Brakelond records, in what Carlyle calls his "private Boswellian note-book," a discussion in the Chapter in opposition to one of Abbot Sampson's reforms, in which Benedict the sub-prior thinks he makes an effective point by saying, "Abbot Ording, he who lies here, would not have done such a thing for 500 marks in silver." And the *Rituale* (Harl. MS. 2977), which supplied me with one of my strongest arguments in the letter about the bones of St. Edmund which you published on September 5, 1901, contains directions for the censuring of Sampson's place of burial "in the chapter-house."

But the Douai manuscript gives, what nothing else does, the exact positions in this chapter-house where the remains of Ording, Sampson, and four other abbots reposed. Beginning from the east there were—

1. Ording (abbot 1148-57), "first next the steps of the platform";
2. Sampson (1182-1212);
3. Richard de Insula (1229-34);
4. Henry of Rushbrook (1235-48);
5. Edmund de Walpole (1248-57), "towards the door";
6. Hugo I. (1157-80), "next the door of the chapter-house, in number amongst the other abbots sixth and last."

Thus, with the single exception of Hugo II., who succeeded Sampson as abbot and was made Bishop of Ely in 1229, all the abbots who ruled over this great Benedictine foundation for 100 years were buried in the chapter-house, built on this spot by Helyas the sacrist, Ording's nephew.

The reference made to the seat on which an errant brother had to do penance for minor offences, "between the lectern and the feet of Abbot Richard," comes from another manuscript altogether, relating to the discipline of the monks (Harl. MS. 3977). The phrase by no means implies that the seat and the lectern (of which no trace now remains) made a gap or space between the tombs, and in this view I have the support of Dr. James himself. They may have been at the side; they may even have been over the tombs, the coffins being found some 6 inches below the floor level (shown by some large coloured tiles still *in situ*).

At any rate, what has been found at Bury in the course of the recent excavations is this. The remains of an oblong building in the position assigned in all the documents to the chapter-house—a building, moreover, corresponding very fairly both as to length and breadth with William of Worcester's pascings of the chapter-house in May 1479. At the east end, the boundary of which is well defined, are curved steps; more to the west, indications of a slightly raised and perhaps circular platform; still further to the west and midway between north and south walls, five stone coffins, each containing a complete human skeleton; to the west of the fifth coffin a sixth skeleton (uncoffined) in a straight line with the others, and then the west wall.

The six skeletons lie due east and west; the five coffins are quite close to one another, no gap existing between them; one (No. 2) is broader in the upper part than the rest. To avoid possible depredations by some of the crowd of curious spectators who have been attracted to the spot by the reporters' versions of the finds published in the local newspapers, the bones have been carefully and scrupulously removed from the coffins and placed temporarily in numbered receptacles, under strict lock and key.

Mr. Henry Donne, who is the agent for the estate on which the excavations have been made, and who has been indefatigable in his exertions in the matter, has the skeletons in his personal charge; but I was permitted by him to inspect them, and he drew my attention to a pronounced green pigmentation of the skull and to other peculiarities of the bones of skeleton No. 3. According to the Douai manuscript, this body should, if our contentions are correct, be that of Richard de Insula.

Now, according to Matthew Paris, this Abbot Richard went to Rome on a mission to the Pope, and on his return journey home was stricken with a mortal illness at Pontigny, in France, where he died in 1234. Obviously, therefore, his body had to be embalmed or preserved in some way whilst it was being brought home to Bury; and hence, no doubt, the colouration of skeleton No. 3.

But, after all, what the general public will chiefly desire to know is whether the veritable bones have been found of that grand old Abbot Sampson immortalised by Thomas Carlyle as the type of a "man who does." In "Past and Present" the sage of Chelsea thus summarises from Jocelin de Brakelond the physical characteristics of Sampson:—

"A personable man of seven-and-forty; stout-made, stands erect as a pillar; with bushy eyebrows, the eyes of him beaming into you in a really strange way; the face massive, grave, with 'a very eminent nose'; his head almost bald, its auburn remnants of hair, and the copious ruddy beard, getting slightly streaked with grey."

This was at the time of his election as abbot. Thirty years after Sampson died, and was followed to his grave in the chapter-house by the unstinted reverence, love and sorrow of the entire community.

As the result of my personal visit to Bury St. Edmunds yesterday, I myself have not the smallest doubt that in tomb No. 2 (broader at the top, as I have said, than the others, and not long enough to contain a "very tall man," as to which there seems to be some unfounded rumour) have reposed for the last 700 years the bones of this great man. I was permitted to handle his skull, which is quite intact, and should be a study for phrenologists. The lower jaw contains a few much worn and discoloured teeth like those of a very old man (Sampson was seventy-seven years of age when he died).

A careful scientific examination of all the skeletons by a very eminent anatomist is being arranged for; and when this has been completed the bones will be reverently restored to the coffins with due care and precautions, and covered up with new and massive stone lids which are being made for the purpose. A full statement of the excavations, with a description of the tombs and skeletons found, is also to be prepared and issued under the authority of the local committee who have the matter in hand; and this statement when issued will, as I venture to think, completely resolve any doubts which may be felt as to the authenticity of the discoveries. There are other excavations of high and perhaps even higher importance to be made in the abbey precincts; and perhaps I may be permitted to end this letter by saying that any contributions towards the expenses which may be sent to the honorary treasurer, Mr. Algernon Bevan, Capital and Counties Bank, Bury St. Edmunds, will be gratefully received by the committee.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of the Society of Antiquaries of Scotland was held in their library at the Museum, Queen Street, on Monday evening. Dr. Robert Munro, vice-president, in the chair.

The first paper was an account by Professor Sir William Turner, KCB, D.C.L., LL.D., of a chambered cairn, with cremation cists, at Taversoe Tuick, near Trumland House, in the island of Rousay, Orkney, excavated by Lieutenant-General Traill Burroughs, of Rousay and Veira. The mound was circular, with a diameter of about 30 feet, and covered with grass and heather. The excavation, which was begun on the south side, disclosed three cists of small size, containing burnt bones, and placed in close proximity to each other. Under them was a layer of earth about a foot in thickness, and when this was removed the stone roof of the underground chamber was exposed, upwards of 4 feet under the original surface. The roof was formed of massive flags, resting on the side walls and ends of the chamber, which consisted of a central part facing the opening into the entrance passage, and four recesses, two on the north side and one at either end on the east and west. The entire chamber (including the recesses) was 12 feet long, nearly 5½ feet broad and 4 feet 8 inches in height, and the recesses were separated from each other by flags projecting from the north wall. The passage which opened on the south side of the chamber diminished gradually in height and width towards the interior of the mound, and had a small recess on one side near the chamber, and a flag projecting from the floor, like a sill, at about 13 feet from the chamber. Towards the interior entrance the passage curved slightly to the east. Three heaps of bones, representing probably as many skeletons, lay in the passage between the chamber and the sill-like stone, and immediately to the south of the sill there was found the half of a finely-made hammer of grey granite, a triangular flake of flint, and numerous fragments of urns of a hard black paste, ornamented on the part near the rim by groups of parallel lines arranged in triangles. In the chamber itself several unburnt human

skeletons were found placed in the usual contracted posture on the floor, but from the fragmentary condition of the bones no definite conclusions could be formulated. The incinerated bones in the cists were mixed with a slag, indicating cremation at a very high temperature.

In the second paper, Mr. F. R. Coles, assistant keeper of the museum, gave a report in continuation of previous surveys of stone circles in the north-east of Scotland. The present survey included the districts between Ellon and Rothiemay the circles and remains of circles described being chiefly in the parishes of Rayne, Fyvie, Auchterless, Forgue and Inverkeithny, all which were illustrated by measured plans and drawings obtained under the Gunning Fellowship. The report included a total number of forty-two sites, eleven of which are those of standing stones merely, seven are sites of circles, now represented by one or two stones only, ten are sites of circles which are distinguished by having a recumbent stone, and seven are circles of upright pillar stones, without the special feature of a recumbent stone. The circle at Rappla Wood, Burreldales, is interesting from its peculiar features and from the fact that when excavated by Mr. J. H. Chalmers in 1861 several different modes of burial were found within its area, with fragments of urns, both of the cinerary and food-vessel types, and portions of a thin bronze dagger-blade. The Carlin stone at Backhill of Drachlan, with a few smaller stones, is now all that remains of a large circle described long ago by Rev. J. Pratt, and in which, as stated by the present tenant, there were found at different times a small perforated axe-hammer, portions of bronze penannular armlets, chips of flint and a button of jet, which latter object has been presented to the National Museum by the present tenant, Mr. Peter Anderson. The remains of the circle at Yonder Bognie show it to have been one of the most imposing in the district, the recumbent stone being over 9 feet in length, 4½ feet in breadth and 5½ in height, computed to weigh nearly 11 tons. A specially interesting circle of small size is that of Whitehill Wood, Forglan, which consists of seven stones with a diameter of 29 feet and stands conspicuously on the summit of a hill over 700 feet above sea-level. The third paper, by Rev. J. C. Carrick, gave an account of the churchyard monuments at Newbattle. The parish has no fewer than five separate places of burial, the principal of which is of course the parish burying-ground, of the most important and interesting old monuments in which a detailed account was given. Some have peculiar heraldic and emblematic figures, and others quaint and interesting epitaphs. Among the relics connected with the ecclesiastical establishment of Newbattle are also a funeral bell, the heavy irons used to protect the graves from desecration by the resurrectionists, and till a few years ago the watch-house stood in a corner of the churchyard.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A LARGELY attended meeting of the Edinburgh Architectural Association was held on the 7th inst. at 117 George Street. The president (Mr. A. Hunter Crawford) delivered the first of a series of papers on the "Building of a House." The papers deal with an actual building, and are intended to bring the methods of construction definitely and clearly before the members of the Association. Mr. Hunter traced the erection of the house from the time an application was made to the local authorities until the foundations were laid and the building brought up to the asphalted level. At the close of the paper, Mr. Hunter answered several questions by members dealing with the technical points of his subject.

OLD GLASGOW.

AT a meeting of the Architectural Section of the Royal Philosophical Society of Glasgow, on Monday night at 207 Bath Street, Dr. David Murray read a paper entitled "The Architecture of Old Glasgow." Mr. James Chalmers, president of the Society, presided. In the course of his remarks he said all the mansions, great lodgings and stately tenements, so affectionately catalogued by M'Ure in his old history of Glasgow, had disappeared. All the picturesque streets and long interlacing closes had been mercilessly swept away by the Corporation, and a spick and span new town substituted, more commonplace than any American city. It might be well questioned whether all that was necessary for the sanitation of the city could not have been effected without the wanton destruction of whole streets of picturesque and characteristic buildings. In his early days it was a constant pleasure to wander down the High Street and the Salt Market, and the Bridgegate and Stockwell, and through the endless closes which fringed them. Now all had gone, and it was impossible to recognise the streets or distinguish the localities. Dr. Murray submitted for the inspection of his audience a number of interesting drawings of Glasgow as it appeared in former days.

NOTES AND COMMENTS.

ORIGINALLY, we believe, a Scottish Dean of Guild was the head of the Guildry or Company of Merchants, but in course of time he has come to be the chairman or judge in applications to erect buildings, and it is his duty, with the aid of the officials, to see that local regulations are respected. For such an office some acquaintance with construction is desirable, but, on the other hand, if an architect, surveyor or builder should undertake the office he becomes handicapped in respect of other transactions. This has just been demonstrated in the Scottish Courts. In 1897 Mr. JOHN LOWNIE, of Edinburgh, entered into a contract with the Edinburgh Corporation for the masonry of a fever hospital. It was arranged that all disputes between the parties should be referred to Mr. ROBERTSON, of the Office of Works, or, failing him, to Mr. ORMISTON, a surveyor. In May 1898 a question of the kind arose. Mr. ROBERTSON declined to act; his place was taken by Mr. ORMISTON, and decided by him. In November 1898 Mr. ORMISTON was elected Dean of Guild, and held that office until November 1902. In July 1902 a claim was made by the contractor on account of extra work, and he invoked the aid of Mr. ORMISTON as arbitrator, who made the necessary arrangements for hearing it. The Town Council objected on the ground that Mr. ORMISTON was disqualified, as he was Dean of Guild, and consequently a member of the Town Council. They applied for an interdict against his acting as arbitrator. The contractor opposed the application, maintaining that although the objection might be raised by him, it was not one for the Town Council to raise. Lord Low, before whom the case came, granted the interdict. It appeared that the Corporation had consulted with Mr. ORMISTON while he was Dean of Guild on matters relating to the contract and the condition of the works. A counter-claim was made against the contractor for delay amounting to 3,000*l.*, and it was considered that as Mr. ORMISTON had already expressed an opinion on the subject, he was not in a position to act as arbitrator. His Lordship said he did not think there would be any likelihood of Mr. ORMISTON consciously and intentionally favouring one side or the other. The true ground of objection seemed to be that he would not approach the question with an entirely open mind, and that his judgment might unconsciously be affected by what occurred when he was Dean of Guild. For that reason the Corporation were not bound to accept him as arbitrator. The decision will be likely to prevent architects or surveyors from seeking to become Deans of Guild, for as litigation easily arises in Scotland, they might be placed in an embarrassing position if they had acted any time in a professional capacity for any of the litigants.

AN interesting form of memorial is a scholarship for architectural students. The Americans appear to recognise its value. One, which is a memorial of the late JOHN STEWARDSON, is to be competed for in the University of Pennsylvania in next April and May. The value of the scholarship is 1,000 *dols.*, and the holder is to spend one year in travel and in the study of architecture in Europe. Candidates for the scholarship must be under thirty years of age, and must have studied or practised architecture in the State of Pennsylvania for the period of at least one year immediately preceding May 23, 1903. Preliminary examinations will be required in freehand drawing, history of architecture, construction and language. Graduates of schools of architecture will be exempt from the preliminary examinations. The final examination consists of a design for an official building for a county. It would be well if a similar practice were adopted by wealthy people in this country.

THE Society for the Encouragement of the Fine Arts, which was founded in December 1858, has removed from Conduit Street to the galleries of the Royal British Artists in Suffolk Street. Although in financial condition the Society cannot be considered prosperous, it has been worse. Twenty-five members were elected last year. During the coming session, which begins on February 5, lectures will be given on "The Music of Oriental Nations," by Mr. G. F. JACQUES; "The Spirit of Ancient Egypt," by Mrs. LINCHAM; "The Bogey in the Studio," by Sir WYKE

BAYLISS; "Ruskin's Bible of Amiens," by Mr. H. BEAUMONT; "Pictorial Imagination Expressed by Snapshot Drawing," by Mr. T. R. ABLETT; "Our Allies in the Far East," by Mr. ARTHUR DIOSY; "A Forgotten People, the Hittites," by Mr. JOSEPH OFFORD. There will also be two conversazioni.

THE following resolution has been adopted by the Society of Antiquaries:—"The Society of Antiquaries of London hears with regret that there is a proposal on foot to destroy the Church of All Hallows, Lombard Street, in the City of London, a building of interest in itself as being the work of Sir CHRISTOPHER WREN, and containing much fine woodwork of his time. The Society ventures to appeal to the parishioners to withhold their assent to any scheme that will involve the destruction of their church." A similar resolution was agreed to on Tuesday by the London and Middlesex Archæological Society. The present church, as is well known, was erected by WREN at a cost of 8,058*l.* It was completed in 1694. Its predecessor is referred to in JOHN STOWE'S "Survey of London," and the passage is worth reprinting:—"In Lombard street is one fair parish called Allhallows Grasse church in Lombard street; I do so read it in evidences of record, for that the great market went down that way, when that street was far broader than now it is, being straitened by encroachments. This church was lately new built. JOHN WARNER, armourer, and then grocer, sheriff 1494, built the south aisle; his son, ROBERT WARNER, esquire, finished it in the year 1516. The pewterers were benefactors towards the north aisle, &c. The steeple, or bell tower, thereof was finished in the year 1544, about the 36th of HENRY VIII. The fine stone porch of this church was brought from the late dissolved priory of St. John of Jerusalem by Smithfield, so was the frame for their bells, but the bells being bought were never brought thither, by reason that one old WARNER, draper, of that parish deceasing, his son, MARK WARNER, would not perform what his father had begun and appointed, so that fair steeple hath but one bell, as friars were wont to use. The monuments of this church be these. The said WARNERS and JOHN WALDEN, draper." The church was not entirely destroyed in the Fire, although it suffered grievously. For a time the parishioners continued to use it, but eventually it had to be taken down, and the existing building was then erected by WREN. The woodwork referred to in the resolution of the Society of Antiquaries comprises an altar-piece, on which a pelican and seven candlesticks are introduced as symbols. An illustration of it will appear next week.

CATHEDRAL SERIES: WORCESTER.—SOUTH TRANSEPT AND TOWER

TOWN HALL, COLCHESTER: COUNCIL CHAMBER.

DESIGN FOR POLICE AND FIRE BUILDINGS, SUNDER LAND.

THE GRANGER MEMORIAL PULPIT, GLASGOW CATHEDRAL.

THE first step has been taken towards furnishing the nave of Glasgow Cathedral. The pulpit has just been erected by Mrs. GRANGER, in memory of her late husband, the Rev. WILLIAM GRANGER. It is situated in the nave, close to the second pillar on the north side, west of the rood-screen. It is entirely of oak and is octagonal in form. The cope is richly carved, and immediately beneath it are traceried panels which at the base are also adorned with shields. The lower portion of the pulpit is pierced and ornamented with traceried panels of varying designs. The stair, which winds round one of the pillars of the nave, is in keeping with the design of the pulpit, and is enriched with a pierced traceried handrail. The newel post has a carved termination in the form of a burning bush—the emblem of the church—with the addition of the bell, bird and fish of the city arms. The manuscript desk is also of oak, richly carved.

The style is Late Gothic—Flamboyant in feeling—showing the influence of France on the Late Gothic of this country. The architect is Mr. P. MACGREGOR CHALMERS, I.A.F.S.A., and the oakwork has been executed by Messrs. HUTCHESON & GRANT, Pitt Street, Glasgow.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER III. (*continued.*)

IT may be advisable at this stage to dispose of a possible criticism that might be urged, namely, that so far the treatment as regards the elevations towards the streets has merely been considered, and it might be asked if the flank and rear elevations should not be equally under the sway of the various principles? This is a question which at first sight is not easily answered. If it were possible to regard obedience to, or infraction of, principles from a moral standpoint—and *merely* from such a standpoint—the answer would be in the affirmative. But the fact is that it is *not* a question of morality in the usual acceptance of the term, but rather of the effect to be produced on the general public; and as the latter is not concerned with concealed elevations, the application of any of the principles to such elevations will proceed on a different and modified basis. Expediency cannot of course be deemed a principle; but it is a factor that has to be taken into account to a considerable extent, more particularly as regards difference of treatment between concealed and revealed elevations. It may be supposed that disciples of the late JOHN RUSKIN would assert that each elevation should be a perfect work of art in itself and for itself; but art has its limitations as well as its claims, though Mr. RUSKIN at times failed to recognise this; and the disciple who would uphold his master's dictum (in one such instance), that a recumbent effigy designed for inspection from a restricted standpoint, should be treated in all respects as the human form with its unlimited freedom of locomotion, would be helping to perpetuate a very false idea of the legitimate claims of art.

The relation of a building to its immediate neighbours is a factor to be taken into account in designing both plans and elevations, the plans only so far as comfort or convenience is affected, but the elevations should be considered in relation to their *Scale* and general suitability compared with the neighbouring buildings. Contrast is a very valuable factor in connection with design, but its use should principally have reference to the special building, and not bear relation to any other. Regarding scale, it must be remembered that if the neighbouring buildings just referred to are likely to have but a short span of existence, then they may be disregarded; but even in that case any violent contrasts, whether of a bijou or of a heroic tendency, are better avoided in such positions. Where these neighbouring buildings may be supposed to have a long unexpired lease of life, then discretion in respect to Scale effects assumes its utmost importance. On the other hand, where a building is entirely isolated (not merely detached) the greatest freedom is assured.

There is a notable trio of buildings in Liverpool forming a good object lesson in the observance of Scale effects, namely, the Walker Art Gallery, the Picton Lecture Hall and the Museum, together with the Free Library. *Scale is, in fact, the reciprocal consideration of neighbouring buildings for the benefit of one or all.*

A contention might be raised at this stage, that a building, in regulating its scale out of consideration for its right-hand neighbour, might woefully fail in respect to the building on its left; but adaptation and compromise can work marvels, and though from an æsthetic standpoint perfection may be missed, yet the earnest endeavour to succeed will leave its mark.

This consideration of scale is an important principle too often neglected in practice; indeed, frequently its neglect is necessitated from financial, commercial or other considerations. None the less should it be an architect's aim to give it due effect whenever opportunity occurs. If he is to act on the basis of considering his art from a selfish, in preference to an art-loving, standpoint, there will be but little use for this principle; but it was not thus that the ancients and mediævals were wont to act. Very hackneyed at the present day is the saying, "Art is long and life is fleeting," but in other days action, to a great extent, took the place of fine phrases.

At times the requirements of scale demand that one building shall, in appearance, either overshadow, or be

overshadowed by another; for instance, in dealing with the entrance lodge to a large mansion, the latter should be allowed a similar ratio of importance to the former as exists between the proprietor and the porter; and this would apply, whether the two buildings were in the same purview, or whether separated by a tortuous drive of two or more miles. Crewe Hall, Cheshire, and its lodges may be instanced in this connection.

Economy is apt to have a most dispiriting effect on architects, whom it fetters at times most uncomfortably; *carte blanche* is their *beau idéal*, though seldom a "realised ideal." It is customary for a client to ask for 1,000% worth of work at a cost not exceeding 750%, and he expects to have his wishes realised. To cut the coat according to the cloth is a good business principle which architects should not despise; but to be asked to cut a coat out of material that will only provide a good waistcoat is very trying.

However, accepting the standard, the manner in which economies can be effected may well be described.

It is not always that local materials and labour are the most economical, but inquiries should be instituted to establish the facts. As regards labour, the way in which this affects design must be apparent. With respect to materials the effect is still more notable. Compare a stone-producing district or neighbourhood, such as Cardiff, with

Elevation showing
Economy with Effect.

FIG. 19.

the clayfields-crowded metropolitan environs. The New-bridge, Abercarne, Pennant and other stones within easy distance of the Welsh capital, blue and reddish-brown in tones, and lending themselves either to ashlar or rough-worked labours, admit of the humblest cottages having a picturesque appearance, to which the purlieus of East

London, with their dingy brickwork, are perfect strangers. Consequently, less attention to design (as the word is here understood) will be necessary for the stone than for the brick dwellings, in order to procure an equality of effect. And just as relief is obtained in London and other such houses by using stone dressings (to a greater or less extent) with brick facings, so is the brick used as a relief in the shape of quoins and lacing courses to a stone dwelling.

But it is of even greater importance to bear in mind the following axiom, namely, *adapt the design to the materials*. It is bound to have an economical effect on the scheme. This portion of the subject will not be further dealt with at this place, as the use of materials is considered later in the series. Should neither stone nor suitable facing bricks be obtainable at a reasonable or an economical price, then a stucco face might be used as a finish, though it is not to be commended for general acceptance.

Another point to remember is to avoid florid design, whether for the sake of economy or art; but in proportion as the former is of greater or less import must ornament be more or less avoided. In fig. 19 is given in elevation a design used for some groups of terrace houses in a London thoroughfare. The architect—if one was employed—is unknown to the writer, but the façade allows much to be said in its favour. There were evidently two important factors, namely, economy and attractiveness, and these have been successfully obtained. Though in some minor points further economy could have been introduced without detriment to the façade, it is not of special import to discuss it here.

The preceding remarks lead up to another memorable axiom for the exercise of economy, and that is to *practise the Art of Leaving Out*. One of the best known contemporary black and white illustrators is said to work up his drawings very fully in the first stage, and the succeeding stages are said to witness the gradual and successive deletion of line after line, until the result is a vigorous sketch consisting of *apparently* about half a dozen strokes. This may or may not be his *modus operandi*, and certainly there is not any such mode of execution suggested in the sketches. But still, if any architect care to experiment in this method, he is likely to prove his own monitor, and forbid to himself a second trial. With the architect, as with the art illustrator, the object should be to emphasise form throughout, and decoration can then be applied in proportion to means. An old proverb tells us that "Beauty unadorned is the most adorned," and, like many of these antique phrases, holds less of truth than of its semblance. The writer is not concerned to prove his contention, as the object of referring to the old saying is merely to remark that, for the exercise of economy, unadorned beauty may be necessary; and architects may, if they please, try and console their clients for a bare design (resulting from parsimonious means) by skilful reference to the proverb.

Economy is often obtained by the exercise of the architect's up-to-date knowledge of market goods. It may be a useful hint to advocate personal interviews with all travellers, and the careful perusal (not necessarily an intimate knowledge) of all the trade catalogues forwarded. Many architects are wont to peruse one or more of the professional papers week by week, and this may be advisedly supplemented as suggested. If the daily delivery of catalogues is more or less promptly disposed of in this fashion (varying with the daily pressure of business), their accumulation will neither be burdensome nor will it involve a mass of paper, whose contents are unknown to their possessor. As a result of such general acquaintanceship many possibilities of practical economy arise for the benefit of cautious clients, and to the credit of the architect employed.

It may be contended that this is more concerned with economy of construction than of design; but, to the extent that construction affects (or should affect) design, its inclusion here is justified.

A note of warning must, however, be sounded; this is, that the statements of traveller and catalogue should be accepted with caution. In business affairs, Faith should follow a different course to what it pursues in religion, and should be the companion of knowledge, not of ignorance.

Repetition of design will prove more economical than the individual treatment of features; this is of equal

application in respect to mere ornament, or surface decoration, and to a series of detached speculative buildings.

In the case of mere ornament, it may be very effective, though simple. The accompanying sketch, showing a portion of the south-west tower of Rochester Cathedral, is an instance of this effectiveness of repetition (fig. 20).

S.W. Tower, Rochester Cathedral
(from a photograph)

FIG. 20.

In concluding these remarks, emphasis may be laid on the fact that economy is not necessarily productive of paucity of design. Simplicity is indeed a requisite; in other respects, it is merely a matter of adapting your design to the means at disposal.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

The following were elected as members:—Messrs E. E. Lofting, W. Kerr, C. Woodward, C. S. Peach and R. S. Ayling. Mr. W. F. Cave was reinstated a member.

New Premises Fund.

The PRESIDENT announced the following donations:—Mr. E. Prioleau Warren, 21/-; Mr. W. H. Lever (second contribution of proceeds from the sale of Port Sunlight pamphlets, per B. T. Batsford), 5/-; Mr. G. Horsley, 5/- 5s.; Mr. A. B. Botterill, 2/- 2s.; Mr. M. B. Adams, 2/- 2s.; Mr. W. J. N. Millard (further donation), 2/- 2s.; Mr. A. A. Carder, 1/- 1s.; Mr. T. F. Green (further donation), 1/- 1s., and Mr. L. Judge, 1/- 1s. The total amount previously acknowledged was 4395/- 3s.

Mr. ANDREW OLIVER read a paper on "Old London," being

Notes on Whitehall and the Strand.

The subject which we have to consider this evening by its nature will prove that it will be almost, if not quite, impossible to mention but in a brief manner the various items of interest which attach to it. We have to bear in mind that we are dealing with the ages of the past and with the buildings which in their time took rank as being part of the period to which they belonged, and which now belong to the realm of history, and, like all things which belong to the ages of long ago, there has become woven about them in the course of time, as might be supposed, details of interest which are part of them, and which by their very nature belong to them. It is difficult to believe now that, as the poet Gay expresses it, on the river Thames—

There Essex's stately pile adorned the shore,
There Cecil's, Bedford's, Villiers's now no more.

Of all the palaces but two small fragments are left, viz. the chapel of the Savoy and the banqueting house at Whitehall. We have to gather from various sources, in the names of

the streets, out of books, manuscripts, maps and views what we wish to learn about them, and it is by these means that we shall endeavour to pierce the surrounding veil and learn something of the buildings which are now little more than traditions. It is proposed to take the subject in the following order:—Whitehall, the palaces which were formerly along the side of the river, the north side of the Strand to Charing Cross.

Whitehall in the sixteenth and seventeenth centuries consisted solely of the palace. In the eighteenth century were erected the Horse Guards and Dover House on the site of the tilt-yard, the Treasury on that of the cockpit. In the nineteenth century the Privy Council and Education Offices were erected on the old tennis court, and various other streets and private houses were erected during that time.

The history of Whitehall may be briefly described. Hubert de Burg devised his house here to the Black Friars in 1242, who sold it to Walter de Grey, Archbishop of York. It continued as the London house of that see until, by a deed dated February 11, 1530, Wolsey conveyed York House to Sir Thomas More and others on the king's behalf. In the year 1536 an Act of Parliament was passed which said that the old palace of Westminster was then, and had been a long time before, in utter ruin and decay, and that the king had lately obtained one great mansion-place and house, and that upon the soil and ground thereof he had "most sumptuously and curiously builded and edified many and distinct beautiful, costly and pleasant lodgings, buildings and mansions and adjoining streets;" had made a park,* and walled and environed it round with brick and stone, and there devised and ordained many and singular commodious things, pleasures and other necessities, apt and convenient to appertain to so noble a prince for his pastimes and solace. In the year 1606 the "old, rotten, slight builded banqueting house," built by Queen Elizabeth, was removed and a new one built in the following year, but of this we read as follows:—"About ten o'clock in the morning, upon Tuesday, January 12, 1619, the fair banqueting house was upon the sudden all flaming, a fire from end to end and side to side . . . at sight whereof the Court, being sore amazed, sent speedy news to the great Lords of the Council, who were then but newly sat in the Guildhall in London, but they all rose and returned to Whitehall and gave directions to the multitude of people to suppress the flames and by hook to pull down some other adjoining buildings." Upon the site of this destroyed edifice was erected the present one. The last of the old buildings disappeared on April 10, 1691, when the whole of the building, with the exception of the banqueting house, was burnt. In Evelyn's "Diary" it is thus described—"Whitehall burnt, nothing but walls and ruins left." Six years later, in 1697, a second fire broke out. After this nothing was done to rebuild it. William III. died and Queen Anne lived at St. James's, and with this came the end of Whitehall as a royal palace.

The banqueting house is the only portion that was erected of the building designed by Inigo Jones. As already stated, it took the place of a former building which was destroyed by fire. It was commenced on June 1, 1619, and completed March 31, 1622, the total cost being 14,940*l.*, an additional 713*l.* being expended on a pier at Oatland. The original account is to be seen at the Record Office, from which it would appear that the excess of cost over the original estimate was 5*l.* The account was not settled in full until 1633. The architect received 400*l.* The great painted ceiling by Rubens consists of three central compartments, and the same number, but smaller, on either side. It represents King James I. welcoming the beauties of Peace. The panels at the sides show the contrast between Peace and War. The inscription at the foot of the engraving is as follows:—"Graved by Sim Gribelin from the painting of Sir P. P. Rubens on the ceiling in the Banqueting House at Whitehall, in the year 1720, *Cum Privilegio Defuncte Annae Reginae*" This ceiling presents in proper and curious emblems the prosperous state of Great Britain in the reign of King James I. His concern for religion, his love of arts and sciences, the birth of a prince, the union of the two kingdoms and His Majesty's most eminent virtues crowned with glory and immortality." The painter received the sum of 4,000*l.*—about 10*l.* a square yard. Before being turned into the United Service Museum it became "The Chapel Royal, Whitehall." It was here that the "Maundy" alms were distributed until the ceremony was removed to Westminster Abbey on the chapel being abolished as a place of worship.

The five large engravings of Whitehall Palace consist of three of the fronts, viz the Westminster, the Park, the River front, a bird's-eye view taken from the Charing Cross side, and a ground plan showing the arrangement of the old palace. The fronts show an elevation divided into four divisions. In the central portion two towers are carried up above the roofs of the adjoining building, with entrance gateway. The main central building is in three storeys, on either side a wing in two storeys, and on the outside of the whole square towers in three storeys. In the bird's-eye view may be seen three great courts to the

left, the line of the roofs separating them being in a line with the square towers of the centre portion of the fronts. The court to the right side is also divided into three, the central one being circular, with an open gallery on each storey, the arches of which are carried on figures. The two other courts are oblong, with a pediment in the centre, the corresponding court on the other side being similar. The central court runs right through the building, the central portion on each face having pediments as the others.

The plan of the palace as it was in the reign of Charles II. shows a large rambling building occupying a area. It extended from what is now Richmond Terrace along the river to Great Scotland Yard, close to where the National Liberal Club now stands. It included on the north the Horse Guards, the Treasury and Downing Street. A gateway was placed at the south end of the banqueting house and another at the corner of Downing Street. The south side of the palace began with the bowling-green, next to this was the privy garden. The front consisted of the banqueting hall, the gate and gate terrace and a long row of mean buildings. The gate opened upon a series of three courts or quadrangles. In the first, called the Court, was situated the banqueting house, opposite to this on the east side was the great hall or presence chamber, the chapel and the private rooms of the king and queen. This part contained all that was left of old York House. Behind the privy garden was the stone gallery, which contained the art gallery and library. Between the river and the stone gallery were the apartments of those connected with the Court. The number of apartments amount to fifty-eight. In the second court we find the kitchen, pantry, cellars and several others, each with its own superintendent with his own quarters—in fact, everything that could be wanted to carry on so large an establishment as we find here, that occupied the site of what is now Old Scotland Yard and Whitehall Place. In Scotland Yard were placed storeshops, with a wharf on the river; in front of the palace were the tilt-yard and the Horse Guards yard, and in front of the privy garden the cock pit and tennis court and various apartments, chiefly of great officers.

The river front of Whitehall consisted of a red-brick wall with six small turrets. In the Crace collection at the British Museum there is a water-colour sketch showing a portion of the river wall and the palace. There is shown on Vertue's plan a landing stair leading to the bowling-green, which was close to the wall. The privy garden stairs consisted of a long bridge or gangway about 70 feet in length, with the stairs at the river end, and a little further on were the palace stairs, about 150 feet in length and similar to the other. At the easternmost corner of the wall was Scotland Dock, where the stores were landed on to "the wharf," to which the dock gave access.

The earliest map of the Strand is Ralph Aggas's, 1560. In the rear of Charing Cross is the royal mews, surrounded by a wall at the northern end, buildings being situated at the west and south. To the west is Hedge Lane, now Whitcomb Street, which joins the southern wall of the mews and Cockspur Street. St Martin's Lane on the eastern side ends opposite to Northumberland House. Opposite to the eastern wall of the mews is St. Martin's Church, and above St. Martin's is the convent or Covent Garden, bounded by a wall, now Long Acre, which joins Drury Lane and which is continued into Wych Street, the old name being "Via de Aldwyche," corrupted into "Wyche Street." At the end of this is St. Clement Danes, which is hemmed in by houses on all sides. A single row of houses is between St. Clement Danes and Charing Cross. On the south side of the Strand the houses of the nobility which faced the river are to be seen.

It is to the period of the seventeenth century that we owe nearly all of the streets that are at present to be found in the Strand and Covent Garden, and the church of St. Clement Danes. The churches of St. Martin and St. Mary-le-Strand belong to the eighteenth century, as well as Southampton Street, which was made in 1704 on the site of Bedford House; the Adelphi, by the Brothers Adam; and Bow Street was prolonged to Long Acre, continuing the portion between Hart Street and Great Russell Street.

Although there have been but few new streets formed in the nineteenth century, at the same time great improvements have been made at the eastern and western ends of the Strand. In the year 1863 Garrick Street was made to connect Long Acre with Henrietta Street. Wellington Street was made to connect Bow Street, which originally ended at Great Russell Street, with Waterloo Bridge. The improvements at Trafalgar Square and those near St. Martin's Church took place in the years 1830-32. Northumberland Avenue in 1874. And the new street to Holborn was commenced in 1901. The Victoria Embankment commenced in 1863 and completed in 1870.

A plan of the royal mews, taken at the close of the eighteenth century, shows that they occupied the centre of a space which extended from the site of the National Portrait Gallery to within 75 feet of the statue of King Charles. The

* St. James's Park.

great mews was about 370 feet in depth by about 240 feet in width. At the further end were the royal stables with a depth of 50 feet, and in rear the green mews, which had a depth of 130 feet. The front elevation of the royal mews, erected 1732, shows a building in two storeys. The centre consisted of an arch with a range of windows over, and above them the royal arms under a pediment, carried upon two pairs of rusticated columns. At the further end there is a cupola which is in two storeys, and the line is carried down into the main building, where the cornice is broken by a pediment.

Beyond is St. Martin's Church, the portico being nearly concealed by the houses which are in front of it. The present church was erected in the year 1721, when that which previously occupied the site was taken down. It was built by Gibbs. A sarcastic allusion to the worshippers and the new church occurs in the *London Spy*, 1725:—"The inhabitants are now supplied with a decent tabernacle which can produce as handsome a show of white hands, diamond rings, pretty snuff-boxes and gilt prayer books as any cathedral whatever. There the fair penitents pray in their patches, seek for pardon in their paint and see their heaven in man."

The first great change was made when the new street was cut in prolongation of Pall Mall to St. Martin's Church, about the time when the National Gallery was commenced. Sir Charles Barry's idea for Trafalgar Square was different to what we see it now. He intended a low flight of steps to lead up from the Square to the National Gallery. In place of the present fountains, which he wished to have much larger, his intention was to have had monuments to Wellington and Nelson.

The story of the erection of Charing Cross and the others of a similar character is too well-known to touch upon here. The original structure was of wood, but later on it was built in stone by Richard, and after his death by a son or a brother of Roger de Crundale: the material was of Caen stone. The Cross itself was ordered to be taken down in 1643, but it was not destroyed until four years later; the site is now occupied by the statue of Charles I. In the dialogue between the Cross in Cheap and Charing Cross, 1641, we find the following humorous description:—"In King Henry's days I was begged. . . . Then in Edward the VI., when Somciset House was in building, I was in danger. After that in the reign of Queen Elizabeth, one of the footmen had like to have run away with me; but the greatest danger of all I was in was in the time of King James, when I was eight times begged. Part of me was bespoken to make a kitchen chimney. . . . An innkeeper in Holborn had bargained for as much of me as would make two troughs. . . . The rest of my poor carcase should have been carried, I know not whither, to the repair of a decayed stone lodge, as I was told, on the top of Francis Hill."

Northumberland House has been known by the name of Northampton House and Suffolk House. The Strand front consisted of a long wide-spreading building; in the centre a gateway with a low window which was continued up above the top storey, where it terminated in an arch, over which there was placed the Percy Lion. As seen here the lion faces the west, but in the time when George IV. was king it was turned round the other way. The lion was, when the house was taken down in 1874 placed on the top of Sion House, opposite to Kew Gardens. At the four corners were square towers with small figures at the angles. A view of the garden front of Suffolk House will be found in Wilkinson's "Londina Illustrata."

From the palace of Whitehall to Arundel House there stretched a line of river palaces the whole distance, the sites of which can even now be traced in the names of the streets. The two earliest maps which show where they were situated are Ralph Aggas's map, 1560, and Hofnagel's, 1572. In those times the greater number belonged to the bishops. The great nobles it would appear appropriated them, and in later times they have been disposed of as eligible building sites. They were destroyed in the seventeenth and eighteenth centuries. The principal fronts faced the river, the Strand apparently possessing a long unlovely line of high brick walls to hide the great personages from the eyes of meaner mortals. On the northern side of the Strand we find, also, a row of houses with gardens in the rear, as Bedford House, Burleigh House and others.

The way of access both from and to the river was by what were termed stairs, and these were situated either at the end of a street or else only belonged to the house which they adjoined. In the latter case they were private and in the former public. Of the first division there is but one now left, viz. York Stairs, and the archway at the end of Essex Street marks the old entrance to the house from the river. Stairs were also at Hungerford House, Salisbury House, Worcester House and Somerset House. Public stairs were at Ivy Bridge Lane, the end of Arundel Street and other places. In addition to being used as a roadway to the river, the streets also formed the boundaries of the various properties. For instance,

Exchange Lane separated York House from Durham House, Ivy Bridge Lane Durham House from Salisbury House, &c. Nearly if not all of these old lanes are still in existence at the present time. The stairs for the most part, with the exception of York, Essex and Somerset Stairs, possessed no architectural beauty, being merely an arch in the river wall.

Old Hungerford Market, which was destroyed in 1862 to make room for the Charing Cross railway station, was erected at the close of the seventeenth century on the site of Hungerford House. The history of the family will be found in Sir Bernard Burke's "Vicissitudes of Great Families." Sir Edward Hungerford, it would appear, had here a magnificent mansion, which on the break-up of Durham House was cut up into small tenements, which together formed a market. Over the market was a room called the French Church; afterwards it became a charity school, and lastly a tavern and music-hall. The town house of the family was destroyed in 1669, and is thus described by Pepys:—"April 26, 1669. A great fire happened here last night, burning the house of one Lady Hungerford, by carelessness of the girl sent to take off a candle from a bunch of candles, which she did by burning it off." Sir Edward obtained permission to hold a market three days a week on the site of his former mansion, and this was the origin of Hungerford Market.

York House acquired the name from its having been the residence of the archbishops of York. Before then it was the inn of the bishops of Norwich. The next owner, Charles Brandon, Duke of Suffolk, exchanged Southwark Palace for it. In the reign of Queen Mary it was bought by Dr. Heath, Archbishop of York, and reverted to its original name. Archbishop Matthew exchanged it for several manors with James I. Lord Chancellors Gertin and Bacon lived in it, and it was then granted to George Villiers, Duke of Buckingham, who rebuilt it. The Parliament gave it to General Fairfax, whose daughter married the son of the first Duke of Buckingham, who sold it. The names of the streets are George, Villiers, Duke, Buckingham, and "of Court." Readers of Sir Walter Scott's novel "The Fortunes of Nigel" will recollect this. The only portion now left is that known as the York Stairs Watergate. The following account is taken from Britton and Pugin's "Public Buildings of London":—"This fabric is of Portland stone. On the northern or street side it consists of three arches flanked by pilasters supporting an entablature, upon which are four balls. Ornamental shields rise above the keystones of the arches, those at the sides being sculptured with anchors, and that in the centre with the arms of Villiers impaling those of the Manners family. The Villiers motto, "Fidei coticula crux"—"The Cross is the touchstone of faith"—is inscribed upon the frieze. The southern or river front displays a large archway opening upon the steps leading to the water. These conjointly with four rusticated columns support an entablature ornamented with scallops and crowned with an arched pediment and two couchant lions bearing shields sculptured with anchors. In the middle of the pediment, within a scroll, are the arms of Villiers, viz. on a cross five escallops, encircled by a garter and surmounted by a ducal coronet. At the sides are pendant festoons. The apertures flanking the steps are each divided by a small column, and partly closed by balustrades.

The site of Durham House is now occupied by the Adelphi Terrace. It would appear to have been a castellated building, with a square tower at the east end. The main building shows a row of pointed arches. There was also a low, square tower at the west end, together with a round tower, which was carried up above the parapet of the principal building. In 1638 a building called the New Exchange was erected on the site of the stables in the Strand.

Hollar's drawings show Salisbury House to have been of considerable importance. It is designed in two styles, the western building consisting of four gables and a smaller one; the eastern portion looks as if it was like the western when first erected, as a gable end is at the furthest end. In place of the gables we have a battlement or parapet, and turreted angles, showing that the building had been raised at this portion of it. In the river wall there are two sets of stairs and two small structures adjoining. The site is now occupied by the Hotel Cecil.

Worcester House occupied the space known as Beaufort Buildings, but which is now covered by the Savoy Hotel. It originally belonged to the Bishops of Carlisle, then to the Earls of Bedford, and called Bedford and Russell House; then the Earl of Worcester became possessor, and his son, the first Duke of Beaufort, came into possession, and consequently it changed its name. Pennant informs us that the Earl of Clarendon lived here and paid the extravagant rent of 500*l.* a year. Strype tells a curious story that the Earl of Salisbury offered the gardener of the Earl of Worcester 100*l.* if he would cut down a tree which obstructed his view. On this being done my Lord of Worcester built a large brick house which took away the whole of the Earl of Salisbury's east prospect. From Hollar's view this house is not of much importance architecturally speaking. It is similar to the western side of

Salisbury House, with six gables. A battlemented parapet forms the garden wall.

The Savoy Palace, or rather what is left of it, was built by Simon de Montfort in 1245. It was granted by king Henry III. to Peter of Savoy in the thirtieth year of his reign. It was given by Peter to the Brethren of the Great St. Bernard, who had a priory at Hornchurch, Essex; from them it was purchased by Queen Eleanor, and presented by her to Edmund, Earl of Lancaster, and it has since that time always belonged to the Royal Duchy of Lancaster. Henry VII. restored it, and dedicated it to St. John in 1509 for use as a hospital for 100 poor people. We find a different state of things in 1755. Strype gives the following account:—"This Savoy House is very great, and at present a very ruinous building; the large hall is now divided into several large apartments, a cooper hath part of it, other parts serve as two marshalseas for keeping prisoners—as deserters, &c."

The chapel of the Savoy was the last place where the so-called Fleet marriages were carried out. Long after the right of sanctuary was abolished it was a place of refuge for debtors. In the *Postman*, 1696, is the following:—"On Tuesday a person going into Savoy to demand a debt from a person which had taken sanctuary there, the inhabitants seized him and agreed after the usual custom to dip him in tar and roll him in feathers; after which they carried him in a wheelbarrow into the Strand and bound him fast to the Maypole."

In order to obtain a site for erecting Somerset House the Lord Protector cleared away, according to Stowe, several buildings. The following is his account:—"Next beyond Arundel House was some time a fair cemetery, and in the same* a parish church called the Nativity, Our Lady and the Innocents of the Strand, and of some by means of a brotherhood kept there, called St. Ursula of the Strand, and near adjoining to the said church there was an inn of Chancery, commonly called Chester's Inn because it belonged to the Bishop of Chester." There is some doubt whether the Protector ever resided there. The building was commenced in 1547. He was committed to the Tower in 1548 and remained there for two years. In 1549 he was again arrested and beheaded in 1552. A short account of its later history may be of interest. At the death of the duke it was forfeited to the Crown, who made it over to the Princess Elizabeth on her coming to the throne. It was returned to the Dowager Duchess of Somerset. The queen of James I. lived here. It was then called Denmark House. The palace was much improved by the queen, and Inigo Jones was employed to carry out the work as architect. The architect is given in Pennant as being the celebrated John of Padua. The architect of Longleat, Wilts, he is said to have held the post of deviser of His Majesty's buildings. The Strand front of Somerset House consisted of a central gateway, with a bay over in two storeys. On either side of the gateway were two windows with pedimental heads and double-bay windows with similar features. The courtyard front was in two storeys, and consisted of an arcade of nine arches, a bell-cot being placed on the roof.

The gardens faced the Thames. These were laid out in the monotonous style of the period, so well described by Pope:—

Grove nods to grove, each alley has its brother,
And half the gardens just reflects the other.

As regards the architecture, quaint old Stowe has the following:—"I am extremely pleased with the front of Somerset House, as it affords us a view of the first dawning of taste in England, this being the only fabric which deviates from the Gothic or imitates the manner of the ancients. Here are columns, arches and cornices that appear to have some meaning. If proportions are neglected, if beauty is not understood, if there is in it a sharp mixture of barbarism and splendour, the mistakes admit of great alleviation." The old building was demolished in 1776, and Sir William Chambers appointed the architect of the new edifice. The accounts of the building are in the library of the Royal Institute of British Architects.

Arundel House was formerly the Bishop of Bath's inn. Hollar's plates show a large courtyard with buildings. To the left what appears to be either the hall, or possibly a chapel, with four windows in the Perpendicular style, a half-timbered structure next to it, and beyond that an open shed, and to the left another building with a sundial. The lower view of the building last mentioned is on the right of the picture, then next to that a row of outbuildings. Facing us there is to be seen a building with a high-pitched roof, with an open staircase which projects over the courtyard, and the windows are under the steep pitched gable. Just to the right of this is the top of a church tower, possibly St. Clement Danes. In the view looking towards London we are supposed to be on the battlements. Middle Temple Hall is directly in front, and St.

Paul's and other churches in the background. The streets which now occupy the site rejoice in the aristocratic names of Norfolk, Howard, Arundel and Surrey. The site was bought on the death of Lord Seymour, brother of the Protector, by Henry Fitzalan for the "incredibly small sum of little more than 40*l*," we are informed by Strype.

Essex House stood next to Arundel House. A plan of both is given in Walford's "Old and New London," vol. iii. page 72. Of the old house nothing now remains but the water gate at the bottom of Essex Street. It takes its name from the Earl of Essex, the unfortunate favourite of Queen Elizabeth. His son was the great Parliamentary general. About the year 1640 the house was divided. In 1682 Essex Street was built on one-half of the site. The present houses, however, date from the middle of the reign of George III.

Temple Bar, the last of the old City gates, was taken down in the year 1879. For some years after it lay in fragments on a waste piece of land close to Farringdon Market. It was then given to Sir Henry Meux, who has rebuilt it at "Theobalds," in the county of Herts. It must be said that it was a great pity that it could not have been re-erected by the Corporation of the City of London in some locality in the City, instead of its being taken to a place with which it never had any connection. Its place, as is well known, is occupied by the Griffin monument.

On the north side of the Strand there used to be a row of houses which went by the name of "Butcher Row." It took its name from its being the place where "foreign" butchers were allowed to sell meat, granted under a charter of Edward I. to Walter de Barbier. They were termed "foreign" because they did not belong to the City Guild. Stowe thus describes it:—"On the north side, some distance from Temple Bar, from a pair of stocks there standing, stretched one large middle row partly opening to the north, partly to the south, and up west to a stone cross over against the Strand. This stone cross was the old Strand Cross. On the south side of the Strand there was a similar block. The passage between the north and the south sides was so narrow that it was called in Addison's time "The Pass or the Straits of St. Clement."

For the clearing away of this obstruction one man was responsible, viz Alderman Pickett, who afterwards gave his name to Pickett Street. The whole of the north side was cleared away when the Law Courts were built. The money was raised by means of a lottery started in the year 1807, and called the Great City Lottery. This gave rise to great loss and inconvenience, and the Corporation had to obtain no less than six Acts of Parliament to deal with the matter. Alderman Pickett also projected a plan whereby a new street was to be made from Lincoln's Inn Fields to the Strand. This last improvement has taken no less than the space of 113 years to carry out.

In Wych Street, Clement's Inn, which is now being demolished, is situated. It is said to date from the reign of Edward II.

Holywell Street takes its name from the well there. Lyons Inn, upon the site of which was built the Opéra Comique Theatre, stood here.

The Angel inn, shown on the Ordnance map, was one of the oldest in London. It had the characteristic galleries. It was pulled down in 1853. A view will be found in the "Parish of St. Clement Danes," by John Diprose, page 195.

In the *Public Advertiser*, March 28, 1769, is the following:—"To be sold, a black girl, the property of J. B., eleven years of age, who is extremely handy. . . . Inquire of Mr. Owen, at the Angel inn, behind St. Clement's Church in the Strand."

At the Strand end of Wych Street stood Drury House, which gave its name to Drury Lane.

Craven House afterwards occupied the site and later the Olympic Theatre. Pepys tells us how he saw fair Nelly "standing in her smock sleeves and bodice, a mighty pretty creature," at her door in Drury Lane.

The present church of St. Mary-le-Strand is the second, the first one being pulled down to build Somerset House, as we have seen. It was the first church designed by Gibbs, or, as he puts it, "upon which I was employed after my return from Italy." There was no steeple designed for this church, only a small campanile or turret. A bell was to have been at the west end, but at the distance of 80 feet from the west front there was to be a column 250 feet high, intended to be erected in honour of Queen Anne, on the top of which her statue was to be placed, but the thought of erecting that monument being laid aside at the Queen's death it was ordered to erect a steeple instead of the campanile as first proposed. The site was occupied by a windmill in the time of James I. The site of the old Strand Cross is marked on the Ordnance map as being just within the porch of the present building, and this was afterwards the place where the Strand Maypole was erected, which was pulled down in 1644, and a new one put up after the Restoration in 1661.

* This is marked on the Ordnance map as being at the east side of Somerset House as well as Chester's Inn.

Pasquil's "Palmodia and Progress to the Tavern," 1619, has the following :—

Fairly we marched on. Till our approach
Within the spacious passage of the Strand,
Objected to our sight a summer broach
Uclept a Maypole, which in all our land
No city, town nor street can parallel.

In 1798 James Brainton, in the "Art of Politicks," wrote as follows :—

What's not devoured by Time's destroying hand?
Where's Troy? and where's the Maypole in the Strand?

Burleigh House was "a noble pile built in brick and adorned with four square turrets" facing the Strand. Its gardens extended from the west side of Wimbledon House, close to where Wellington Street now is, to the green lane westward, now Southampton Street. On Lord Burleigh's death in 1598, it came to his son, afterwards the Earl of Exeter. Exeter Change, a curious mixture of shops and menagerie, occupied the site later, and was taken down in 1863.

In 1552 "John Russell, Earl of Bedford, was granted the Convent or Covent Garden, lying in the parish of St. Martin-in-the-Fields, with seven acres, called Long Acre, of the yearly value of 6*l.* 6*s.* 8*d.*, parcel of the possession of the late Duke of Somerset." The first market was erected in 1632 by the Earl of Bedford, the charter dating from 1671. The church of St. Paul, designed by Inigo Jones, erected between 1631 and 1638, was then, as now, the western side of the Garden, the southern side being formed by the blank wall of Bedford House. In an old print the market is shown as being fenced in. In the centre there was a Corinthian column with a sundial on the top (from an inscription it would appear to have been erected in 1686). The column stood upon a pedestal raised upon six steps. The capital supported a square stone, three sides of which served as sundials. A similar dial used to be at Seven Dials. This was removed with its column to Weybridge Common, where it was re-erected as a memorial to the Duchess of Kent in 1822. Since that time the quaint old dial stone which showed six, viz. one on each of the sides and another on the top, has been lying by the roadside. Now that the London County Council is taking steps to preserve relics of Old London, could not an effort be made to rescue this interesting relic from its present ignominious position?

The paper was illustrated by numerous lantern slides. Plans and old engravings were exposed on screens round the meeting-room.

Mr. R. PHENÈ SPIERS, in proposing a vote of thanks for the paper, briefly alluded to various places in London which he had known as a boy but which had now disappeared.

Mr. W. SPIERS seconded the motion.

Mr. W. A. PITE said the paper had been so graphic and interesting that the old houses and streets were recalled imaginatively into existence. Although for the most part London had been altered and changed, yet with the old names in use the past history could not be forgotten.

The PRESIDENT, in conclusion, said the illustrations to the paper showed how much more picturesque the district round the Strand was in former days, compared to later times, and it was regrettable that so many historical buildings should have been demolished. He thought a study of such districts must help the student to understand the city and the meaning of its names.

ARCHITECT'S FEES.

THE following discussion, according to the *Lincolnshire Chronicle*, took place at the annual meeting of the Governors of the Lincoln County Hospital :—

Mr. Ward said he noticed about 1,346*l.* had yet to be paid for works in progress, or completed and not paid for, but he should like to know if that embodied the whole of the liabilities of the hospital, or whether there would also be what were commonly known as "extras."

To this Mr. Watkins, architect, replied that any extras were provided for. Of the twenty contracts fourteen had been definitely settled, and in the estimate of 1,346*l.* still to be paid he had allowed 150*l.* for any extras that might arise.

Mr. Ward: Then the Governors may reasonably expect 1,350*l.* to cover everything?

Mr. Watkins: Yes, with the exception of some things which have been ordered by the Board, and have not gone through my hands. There are my charges, too.

Mr. Brook thought it would be satisfactory to the meeting if they could have some idea of what the architect was being paid, and if the chairman would give the original estimate of the cost of erecting the laundry and installing the electric light. The figures the Governors had had before them were so enormously greater than their conception was when they commenced the scheme that there must be some explanation

of the extraordinary rise, and he thought it would be satisfactory to the Governors in the county if that explanation could be put clearly before them, and it would be more satisfactory still if they could have a full explanation of what was going to be paid to the architect of a charitable institution for carrying out that work.

The Chairman: Mr. Watkins says he cannot say definitely what his costs will amount to. Still, he might give an approximate estimate.

Mr. Watkins: Before the works were commenced a definite arrangement was arrived at that we were to be paid the usual professional commission of 5 per cent.—that is the scale of the Royal Institute of British Architects—and whatever amount that works out at we shall charge. There is nothing unreasonable about that. When the bill comes in I shall be pleased to answer any question relating to it.

Mr. Ward asked what was the scale of the Royal Institute of British Architects, and Mr. Watkins replied it was 5 per cent. upon the cost of the works and money out of pocket.

Mr. Brook: And 2½ per cent on work not carried out.

Mr. Watkins: There could not have been a clearer arrangement made than was arrived at. I asked for it to be quite understood what we were to be paid, and there was an hour's discussion before it was settled.

Mr. Rainforth remarked he remembered Mr. Clarke estimated the work would cost about 5,000*l.*, and he said at the time the figures would be doubled.

The Chairman: You have proved, then, not very far wrong.

Mr. Clarke retorted he was not going to be held responsible. His was a fair estimate of the work then proposed, but the work had since been about doubled.

The Chairman agreed a great amount of work had been agreed to since Mr. Clarke's original estimate.

Mr. Rainforth said there was an impression that the weekly board had been very extravagant, and that had had a very bad effect on the income. People stated they would not subscribe because the money was being "chucked away."

The Chairman failed to see how such an impression had got abroad.

Mr. Rainforth said people seemed to think it had all been spent on the laundry; he thought it would be well if there were some explanation of exactly what had been done.

The Chairman assured Mr. Rainforth that course would be adopted as quickly as possible, but for some reason the architect had delayed in giving them the final figures. He was quite sure, however, the money had not been spent foolishly, nor extravagantly, and the result to everyone who knew the hospital was extremely satisfactory.

Mr. Rainforth said personally he was quite satisfied; he was simply mentioning the fact that there was an impression that the weekly board had been extravagant, and for the own sakes he thought a statement should be made.

Mr. Brook remarked that was really what he desired; the public required some explicit declaration that the money had been spent wisely for the benefit of the Institution.

The Chairman: And that I think we shall be able to prove.

Mr. Brook added he still thought the Governors would be better satisfied if they obtained, what they had not obtained yet, a statement from the architect as to what he would have taken from the Institution when the whole of the payments were completed. They were no nearer now than they were before, because an architect was entitled to charge 2½ per cent. for work not carried out.

Mr. Watkins replied, supposing plans were made, and the plans were not carried out, and the whole scheme abandoned, of course an architect felt entitled to the charge of 2½ per cent.

Mr. Brook asked if Mr. Watkins received anything for tradesmen's commission, and Mr. Watkins at once rose indignantly, and heatedly denied it most positively. "If Mr. Brook suggests that," he remarked, "I shall require him to prove. It is a thing I have set my face against from the moment I entered the profession, and I challenge anyone to prove I have ever received 6*d.* commission from any tradesman or anyone else except through my legitimate plans. Mr. Brook has no right whatever to come into this room and make suggestions of that kind unless he is prepared to establish them."

Mr. Brook remarked Mr. Watkins's statement that he received nothing in the way of commission on any work would give great satisfaction to the Governors generally.

Mr. Watkins: I never have.

Mr. Brook: I did not say you had, but if you can assure the Governors you have never received any commission on work done at this hospital you will satisfy the Governors.

Mr. Watkins: I say positively I have not.

Mr. Brook: Very well, then, I withdraw it.

Mr. Watkins: And if you can bring any one to speak the contrary I am prepared to meet him.

The Chairman said Mr. Watkins might legitimately be entitled to commission on work done; but he denied he ever received anything.

Mr. Brook: I did not say Mr. Watkins had. I said there was an impression he did, and I also said my impression was that there was certain commission he was legitimately entitled to; I simply asked the total amount he was charging.

The Chairman: He absolutely declares he has not received commission.

Mr. Brook: And that will give general satisfaction to the public of this Institution.

Mr. Watkins: It would be an unprofessional thing to do. I am a member of the Royal Institute of British Architects, and if Dr. Brook could prove his suggestion I should be struck off the roll of that Institution to-morrow. I say it is a most outrageous thing for Dr. Brook to come here and make suggestions and not have evidence to substantiate them.

Mr. Ward remarked he thought there was some misconception and misunderstanding on the whole question. Mr. Watkins seemed to have interpreted Mr. Brook's question wrongly. He (Mr. Ward) understood Mr. Brook to mean, "Was any percentage charged on goods supplied by the tradesmen?" No one suggested for a moment Mr. Watkins received commission from tradesmen; the question was whether he would charge architect's commission on goods supplied by tradesmen. Messrs. Ruston, Proctor & Co., for instance, had supplied boilers, &c., at a cost of about 500*l*. He understood Mr. Brook to mean, "Would commission be charged on that?"

Mr. Watkins: If he means that—

Mr. Brook: That is what I did say.

Mr. Watkins: Well, that was settled at the very beginning. We were to charge 5 per cent. on all work done, whether by Messrs. Ruston, Proctor & Co., or anyone else.

Mr. Watkins added that was quite right too, because they had quite as much trouble with that matter as with anything else. They had to write the specifications of the boiler and prepare the scheme for the whole of the heating of the establishment, showing the pipes and their sizes. Then they had to calculate the cubical contents of every room, and proportion the radiating surface to warm the rooms, in addition to fixing the position of every tank and radiator throughout the building, calculating the size of boiler required, &c., and deciding what kind it should be. They had selected the laundry fittings and shown them on the plans in position; in fact, there was not an article about the place not designed and planned by them, and he contended, therefore, they were quite entitled to receive their commission upon such work. They would find the architect at the county asylum would charge commission on everything which was done there, the same as had been done at Raucoby and everywhere else. Otherwise nearly three parts of the work could be deducted, and that, after the architect had done the work, would be most unfair.

Mr. Brook remarked that it seemed, notwithstanding the explosion, that there was commission after all. When he asked his question he said the architect, so far as he was aware, was entitled to the commission, and it appeared that was so. He was entitled to charge it, and he did. They had the explanation, and there was an end to it. But to compare a charitable institution and the asylum was scarcely right, for the rates bore the cost of the asylum alterations, and in this case the rates could not be called upon. The mistake was in not paying the architect a yearly salary. Had the architect received, say, 100*l*. per annum from the time of his first appointment, it would have been a cheap thing for the Institution. Personally, he did not deem it right the money of a charitable institution should be drawn in the way it was drawn professionally, although he knew it was drawn perfectly legitimately. He suggested strongly that the architect should be given a fixed salary.

Mr. Watkins: I should have been paid well if I had had 100*l*. a year up to now without any commission at all.

The Chairman thought the matter might now drop. Mr. Watkins had clearly shown he had not charged any commission and was not entitled to; he thought Mr. Ward would allow that.

Mr. Ward: Certainly; there was an obvious misunderstanding.

Canon Harvey supported Mr. Brook's version of the question, and Mr. Rainforth, having thanked him for bringing the matter forward, the incident was allowed to be closed.

MANCHESTER SOCIETY OF ARCHITECTS.

A LECTURE on "Architectural Competitions" was delivered to the members of the Manchester Society of Architects on the 8th inst. at the Chamber of Commerce by Mr. Alfred W. S. Cross, F.R.I.B.A., of London. Mr. Cross is the chairman of a newly-formed Architectural Competition Reforms Society. He began his paper by considering whether or not competitions assist the work which architects have at heart, namely, the advancement of architecture. With certain reservations, he contended that they did serve this end, and in spite of the fact that many men of repute condemned the

system on the ground that no man would put forth his best work on the remote chance of gaining a prize in what was virtually a lottery. This argument would no doubt be convincing in the case of a man who conducted his practice on strictly commercial principles, equally with the man who was content to work only for private clients. But when it was considered how popular competitions were with public bodies, and how largely they have increased in late years, and how immeasurably public buildings have improved both in arrangements and architectural character, through competitions, there was no question that the popular feeling in favour of them had done much to foster latent talent in the mind of the architectural student who endeavoured to attain success through their instrumentality. Although the method of conducting competitions might be inefficient, yet competitions themselves could not fail to do good, and it was in consequence of the abuse of the system, not the system itself, that so many architects regarded it with disfavour. Competitions were acceptable alike to the promoters and to the competitors, and the average competing architect put forth his greatest effort in competitive work. The non-competing architects who were opposed to the system based their objections on the fact that there were so many recriminations and charges of improper conduct on the part of the assessor and the promoters after the award had been given. Assuming that competitions were necessary, he thought the time was ripe for them seriously to consider how the frequent abuse of the system could be remedied. They had to contend here with the apathy or half-heartedness of the Council of the Royal Institute of British Architects. In his opinion, at the initial stage of competition for a building of public character the Institute should approach the promoters with an offer to appoint a jury of not less than three assessors. A similar arrangement was at work in France and America, where it was found to work well. The new Society had come into existence to promote reform on these lines.

Mr. Alfred Darbyshire, the president of the Manchester Society was in the chair.

TESSERÆ.

The Sculpture of Wells Cathedral.

IT is very remarkable that Wells Cathedral was finished in 1242, two years after the birth of Cimabue, the restorer of painting in Italy; and the work was going on at the same time that Nicolo Pisano, the Italian restorer of sculpture, exercised the art in his own country; it was also finished forty-six years before the cathedral of Amiens, and thirty-six years before the cathedral of Orvieto was begun, and it seems to be the first specimen of such magnificent and varied sculpture united in a series of sacred history that is to be found in Western Europe. It is therefore probable that the general ideas of the work might be brought from the East by some of the Crusaders. But there are two arguments strongly in favour of the execution being English. The family name of the bishop is English, "Joceline Trotman," and the style, both of sculpture and architecture, is wholly different from the tombs of Edward the Confessor and Henry III which are by Italian artists. There are many compositions of the Almighty creating Eve, by Giotto, Florence; Buonamico (Buffalmacco), Pisa; Ghiberti and Michel Angelo. That of Wells is certainly the oldest, and not inferior to any one of them.

Timber Churches in Britain.

Until lately it was the fashion to believe that there were no stone churches in England until the eleventh or twelfth century. Grose, in the preface to his "Antiquities," says that "the Saxon churches were mostly built with timber, and the few they had of stone consisted only of upright walls without pillars or arches." Sir James Ware, on the authority of a passage in St. Bernard's "Life of St. Malachy," expresses a decided judgment that no stone or mortar building in Ireland is older than A.D. 1148; while for Scotland Pinkerton follows the same line, and affirms that all Celtic buildings, houses and churches up to the twelfth century were only constructed of wattles. The chief authorities usually cited in behalf of this notion of the universality of wooden churches are the Venerable Bede, who tells us that St. Finian, on becoming Bishop of Lindisfarne, A.D. 652, "built a church fit for his episcopal see, not of stone, but of sawn oak covered with reeds, after the Scottish (that is, the Irish) manner." Two manuscript authorities—one quoted by Ussher from a life of St. Patrick, the other from a MS. life of St. Monenna, go to the same extent, viz. that the Scots, that is the Irish and Scotch—for it is known that the same nation is meant—were accustomed to erect buildings only of smoothed timber. Another passage of Venerable Bede has been produced for the same purpose, speaking of the baptism of St. Edwin by St. Paulinus at York, on Easter Day A.D. 627, in the church of St. Peter the Apostle, which while a

catechumen he had built of wood. But surely the least reference to the original would have shown that this was rather an extraordinary case: this wooden church was run up extemporaneously expressly for this baptism—"quam de ligno cum catechizaretur atque ad percipiendum baptismum instrueretur citato opere construxit." And then the historian goes on to say that St. Edwin immediately prepared to build a noble basilica of stone. On the other hand, in well-known passages the same Bede speaks of a British church built at Verulam, A.D. 305, fitting to the dignity of St. Alban's martyrdom, and of the church built at Whithorne, Candida Casa, in Galloway, A.D. 412. But it seems we are not left to the uncertainties of literary evidence on the occasion. We are in possession of what is more decisive than a few passages from MSS or from authors whose testimony is, whichever way tending, only incidental, and who certainly never had the question itself placed before them. Petrie, in his well-known work, has indisputably connected the erection of the round towers as Christian edifices with the times of St. Patrick himself and of his immediate successors. These edifices we all know are of stone; and in England we have a complete series of actual stone buildings, extending from the Roman foundations of Dover and Brixworth in an unbroken series through both British and Saxon times. Roman Britain was by no means a barbarous country, and though the Saxon invasion destroyed most British churches of the basilican plan, yet it would be contrary to all likelihood and experience that the old rules and types of ecclesiastical buildings were so obliterated that at or before the period of the Heptarchy an indigenous style, without reference to a classical origin, grew up spontaneously in Saxon England, which first covered the land with some 50,000 wooden churches, and that gradually this style developed into stone.

Architectural Qualities.

There are four principles, grace, expression, proportion and harmony, which are absolutely necessary to the perfection of architecture, and an infringement of them will invariably produce a harsh and revolting effect. But as beauty in nature is infinite in variety of character, so in architecture it would be absurd in the highest degree to attempt to establish rules or standards which should limit, to certain prescribed principles, the power of producing all that can be called beautiful in it. Yet, as far as the beautiful comes within the cognisance of our reason, we may affix rules which can never be departed from without destroying it. The attributes of grace and expression can hardly be said to come within these rules, but must be principally judged of as to their analogy with the forms of nature. Grace and expression relate to those indefinable principles by which we form and arrange the various members of architecture so as to charm the eye, in addition to the pleasure produced by proportion and harmony of parts, and without which all that would be produced by the latter would be dullness or monotony. These are what may be said to give to any style of architecture its peculiar character and expression accordingly as they are applied, and they are more particularly analogous to grace and expression in the human form and countenance. The principles of proportion and harmony come more immediately within the cognisance of our reason, and may easily be decided upon. Proportion is that by which we regulate the size of the various members with regard to each other, so as to produce symmetry in the whole. To illustrate the importance of this to the production of beauty in a whole, let us suppose a large column to be raised to support something very light and mean in comparison. How revolting this would be to our common sense; and let the grace and proportion of the column itself be ever so beautiful, yet all its effect would be lost in the ludicrous idea presented by its disproportion to the thing which it supported. Harmony in architecture is the agreement of the character of its various parts, and a unity of expression and purpose in the whole. To illustrate this we have only to suppose a structure in which lightness and heaviness of expression, simplicity and intricacy of style, contend together in grotesque confusion, and we shall see at once what is meant by harmony, and how the want of it annuls all beauty.

Surbiton Clock Tower Competition.

SIR,—I am requested by Dr. Coleman to inform you that in reply to the advertisement appearing in your paper of November 21 last 116 designs were sent in, and after several inspections by the committee a selection of five was made, and ultimately the choice fell upon that submitted by Mr. John Johnson, architect, of Queen Victoria Street, London. All the

designs received will be placed on view at the Council offices on Friday and Saturday next between 11 A.M. and 6 P.M.—Yours faithfully,

R. J. LAMB.

Surbiton: January 13, 1903.

GENERAL.

The Council of the Royal Society of Painter-Etchers and Engravers have elected Messrs. W. L. Wyllie, A.R.A., and John A. Ness as Associates of the Society.

St. Mary's, Buckfast Abbey, a Benedictine monastery in the time of St. Dunstan, has just been canonically restored to its ancient use as a Benedictine abbey by the Abbot-General of the Cassinese Congregation. Dom Boniface Natter has been elected the first abbot of the monastery since its dissolution in 1538. In 1882 it was repurchased by a French community of the Benedictine Order, and a large portion of the old abbey was rebuilt on its original foundations by the munificence of Lord Clifford.

The Commission appointed by the Russian Government reports that the entire expense of rebuilding the port of St. Petersburg, with harbours 28 feet deep, and with quays and warehouses, will, according to the plans last drawn up, be about 600,000*l*. It is proposed to call the new port "The Port of Peter the Great."

The Eastern Footway on London Bridge was thrown open to the public on Monday last. The bridge is now closed to pedestrians, as both footways are now available. The work of widening the structure has already been begun, and it will be completed within two years.

A New Room for works of art has been added to the library of Windsor Castle.

The Sum of 900*l*. has been subscribed in order to provide the sedilia for Bristol Cathedral, to carry out the design of the late Mr. Pearson, and the Dean and Chapter have entrusted the work to Mr. N. Hitch, of London, who executed the reredos. It is hoped the work will be completed by Easter.

The Royal Society of British Artists held a special meeting on Monday, when the following water-colour artists were elected members:—E. Birkbeck, Fred. E. Gröne, Allyn Williams, Smallwood Winder, W. T. Hawksworth, L. C. Powles and Romilly Fedden.

The General Purposes Committee of Richmond Town Council have resolved to advise the Council to decline the request of the London County Council that they should become joint plaintiffs in an action against Sir Whittaker Ellis to enforce fulfilment of his alleged promise to restrict building over his land comprised in the view from Richmond Hill. At the same time the committee express the hope that Sir Whittaker Ellis will fulfil his original intentions in the matter.

Mr. Walter Crane has received permission that he may accept and wear the Insignia of the Second Class of the Royal Order of the Crown of Italy conferred upon him by H.M. the King of Italy.

The Specimens of Ordnance Survey maps illustrating different scales and styles, which were shown at the annual meeting of the Geographical Association on Friday last, have been on view during this week in the map-room at the Royal Geographical Society's house, 1 Savile Row, W.

The Harrogate Town Council have decided to postpone the erection of the town hall, owing to the opposition of the ratepayers. Mr. H. T. Hare is to receive the premium of 150*l*., which will be deducted from commission whenever the work is carried out.

Mr. Dunn Gardner, who presented the reredos to Ely Cathedral, died in London on Sunday last at the age of ninety-one. He was a distinguished amateur and collector.

Messrs. S. Pearson & Son, Ltd., have been awarded the contract for the new breakwaters to be constructed at the mouth of the grand harbour in Malta.

A Brick Manufacturer of Chicago has been awarded 22,000 dols damages against the Chicago Masons and Builders Unions for declining to handle bricks made by him. The trade societies believe there will be a reversal of the verdict on appeal.

The Liverpool Architectural Society will hold its fourteenth members' meeting at 13 Harrington Street on Monday next January 19, when a discussion will be opened by Mr. William Goldstraw, Hon. Assoc., on the "Revised Corporation Building By-laws."

We Regret to announce the death on last Monday of Mr. A. C. Breden, A.R.I.B.A., who has been associated with the firm of Messrs Ernest Rüntz & Co. for the last ten years.

Mr. H. H. Richardson will read a paper on "The Legal Rights and Liabilities of Architects and Surveyors" before the Society of Architects on Thursday next.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

BRISTOL.—Feb. 9.—The Bristol School Board invite designs for school premises at Moorfields, St. George, Bristol. The competition will be restricted to Bristol architects. Mr. W. Avery Adams, clerk to the School Board, Guildhall.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

CASTLEFORD, YORKS.—Mar. 31.—Designs are invited for a free library. Premiums 15*l.* and 10*l.* respectively. Mr. H. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

SMETHWICK.—Jan. 31.—Competitive designs and tenders are invited for erection of a refuse destructor. Mr. C. J. Fox Allin, borough surveyor, Town Hall, Smethwick.

ST. IVES, CORNWALL.—Jan. 31.—Competitive plans are invited for the erection of municipal buildings, to consist of a guildhall, council-chamber, jury room, public hall, town clerk's office, surveyor's office, treasurer's office, muniment room, parochial office, mayor's parlour and fire-brigade station and offices. Premiums of 70*l.* and 30*l.* respectively will be awarded to the architects whose plans and specifications are considered to be first and second in order of merit. Mr. Edward Boase, town clerk, Town Clerk's Office, St Ives, Cornwall.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C E, borough surveyor, Council House, Sutton Coldfield.

A NEW FIRE ESCAPE.

It will be with feelings of satisfaction and a sense of relief many of our readers will learn of the advent of a new fire escape, which reduces to infinitesimal proportions the difficulty of effecting a safe escape from burning buildings in which the ordinary means of exit are cut off. To women of all ranks of life the new escape will be especially welcome, for there is no difficulty in entering it, and once in one cannot possibly fall out of this ingenious contrivance, which is the invention of Mr. W. H. Riley, chief fireman in the employ of Messrs. Bradbury, Agnew & Co., proprietors of *Punch*, formerly a member of the Metropolitan Fire Brigade. On buildings of great height in narrow thoroughfares the new escape must prove of indescribable value. It is already attracting much notice, and will be shown at the forthcoming Fire Appliances Exhibition at Earl's Court. The idea reduced to practical utility consists of a not unsightly addition to the architecture of the building it is intended to serve. It comprises an iron conduit carried round the erection, immediately below the roof, from which is suspended a combination wire ladder and fireproof canvas shoot, apertures for entering which correspond with the number and location of the windows in the establishment. When not in use the escape is stored inside or outside the top storey, and can be released by means of simple mechanism, access to which is obtainable from many points inside and one outside the building. It then falls to the ground ready for instant use, and is pulled by the aid of ball bearings in the conduit in a moment to any desired point, a fact which is making it very popular in the equipment of country mansions. While firemen are passing up the ladder women, children, invalids and even insensible and injured persons may slide or be slid with the greatest safety to the ground by their rescuers. The invention, which marks a new era in the bravery and ingenuity which has ever been a tradition of firemen in particular and Englishmen in general, cannot be used by burglars, is practically imperishable, and can be safely used from any height, while in the process of rescue persons may pass through the flames without seeing them.

THE Wigan and District Mining and Technical College, which has recently been completed at a cost of about 50,000l., was formally opened on the 12th inst

ELECTRIC NOTES.

THE inauguration took place on the 8th inst. of the electric lighting installation which has just been completed at Oban. The station is capable of easy extension so soon as required, is able now to light 31 arc lamps and 4,000 incandescent lamps.

WITH the object of providing better ventilation in the Court corridors electrical fans have now been fitted over the entrances to the four lavatories on the Court floor at the Law Courts, while improved means of ventilation have been effected at the various windows of the corridors.

THE new bridge being erected at Barking by A. Fasey & Sons for the U.D.C. of Barking town is of a novel description, being of the roller bascule type. It is to be worked electrically, and the electrical equipment has been entrusted to Messrs. Mather & Platt, Ltd. This comprises two motors of 50 horse-power each, either of which is sufficiently powerful to roll the bridge open, and a controlling switch of special design, by which all the movements are controlled through one lever actuating a barrel contact. The actual power required, as is seen, is not great, since the cables attached to the rolling portion of the bridge, after passing round the hoisting drums, are attached to heavy counterweights which slide down a specially curved path.

ERITH, Kent, is the pioneer in this country of a new system of electric current supply known as the "three high-pressure alternating electric current supply system," now rapidly coming to the fore in America and on the Continent, and from the adoption of which we are led to expect great things. Although the 25,000 inhabitants of the town suffered so great inconvenience by lack of proper lighting facilities, the application to the Local Government Board for consent to a loan of 23,000*l* was opposed tooth and nail by a small section of the community known as the Ratepayers' Association, but a vote showed the majority to be in favour of the proposal. The inauguration ceremony took place on Monday in the presence of a very large gathering, which included Sir William Hart-Dyke, M.P. for the division. The buildings have cost about 20,000*l*. Ample space is available for extensions, and the site can also accommodate a refuse destructor should the Council decide to erect one, and car-sheds for proposed new tramways.

LORD KELVIN and a number of distinguished scientists and prominent men in the railway and commercial world last

week inspected a remarkable new illuminant at the offices of the British Westinghouse Electric and Manufacturing Company in Norfolk Street, London. The new light, which has electricity as its basis, is called the Cooper Hewitt mercury vapour-lamp, and is the invention of Mr. Peter Cooper Hewitt, of New York. The lamp, which is made in a variety of forms, consists of a vacuum tube of any length up to about 6 feet, in which mercury vapour is raised to a high state of incandescence. A curious but quite unusual light of a vivid violet hue almost entirely lacking in red rays is the result, and though for domestic purposes this light would be impracticable owing to the weird effect it produces, it is claimed that for many commercial purposes it has great advantages over the ordinary glow-lamp or the arc light. The chief is the economy effected, the consumption of electricity being only a half watt per candle-power, as against 3½ watts per candle-power in the ordinary glow-lamp. The Cooper Hewitt lamp, moreover, has a very long life, and it has run continuously two hundred days of ten hours each without renewal.

THE swing-bridges over the river Weaver at Northwich have for some time been worked electrically by means of plant supplied by Messrs. Mather & Platt, Ltd., and with such success that the Weaver Navigation authorities have entrusted to the same firm the work of equipping the Anderton lift, where the Shropshire Union Canal joins the Weaver, with electrical plant. By this conversion one man in the switch-house will be able to control all the necessary movements, whereas hitherto eight men have been necessary to work the lifts. The electrical plant to be supplied comprises two motors for working directly the lock gates at the end of the Shropshire Union Canal, which is 70 feet above the level of the Weaver, one motor on each of the pontoons controlling by means of ropes the lock gates at either end, and one motor in the engine-house directly connected to a variable stroke pump to supply water under pressure of 700 lbs. per square inch to the rams. The two vertical cylinders of the hydraulic lifts are connected, so that as one pontoon sinks it forces up the other. An additional supply of water under pressure is, however, necessary to overcome friction and any difference in weight between the two pontoons.

A MEETING of the Glasgow section of the Institution of Electrical Engineers was held on Tuesday evening in the Philosophical Society's Hall, Bath Street, Glasgow, Mr. H. A. Mavor, the president, in the chair. Mr. M'Whirter read a

paper descriptive of a group of faults on a wire in the neighbourhood. He said the problem was worthy of the most serious consideration, but so far he had been unable to arrive at a solution. Mr. Wm. A. Chamen, electrical engineer to the Glasgow Corporation, opened a discussion on wiring. He said electric lighting was not dangerous, but there were risks owing to the carelessness of workmen. If they did not watch it the fire offices would want to increase the insurance premiums. He suggested that gasfitting, electric lighting and water-pipe work should be done by the same men. The most absolute freedom from fire was where the old-fashioned wood-casing was used. That was a terrible confession to make. Wood casing was dangerous if not carefully dealt with. The risk of damage by fire, even though caused electrically, really arose entirely from gas. They must be careful not to put their metal sheathing in contact with metal girders. Discussion followed upon both communications.

VARIETIES.

THE new Court House at Helmsley, Yorks, was formally opened on the 6th inst.

IT is estimated that the additions and alterations which are being or about to be made in the London hospitals will represent during the present year an outlay of at least 1,000,000/.

THE new police buildings erected by the Warwickshire County Council at Atherstone are to be used for the first time on February 3, when the annual licensing sessions take place. The new buildings are somewhat hidden from view in a side street, but they are commodious and well appointed.

AT the Croydon County Council on Wednesday evening Mr. F. C. Lloyd, town clerk of Huddersfield, was elected town clerk of Croydon, in place of the late Mr. Ernest Mawdesley. Mr. Lloyd studied law with Messrs. Watkins & Co., Pontypool, Monmouthshire, and in 1885 was appointed assistant town clerk of Cardiff. In 1895 he was unanimously elected town clerk of Huddersfield, which position he has held until now.

NO definite arrangement has yet been come to with the London County Council regarding the much-needed widening of High Street, Islington. At this week's meeting of the borough council the works committee recommended that the

members of the London County Council representing Islington should be informed that the borough council are not prepared to contribute towards the improvement, as in their opinion it is essentially a metropolitan one.

THIS week's *Jewish Chronicle* states that, after an important and animated debate, the Municipal Council of Modena has unanimously decided on the demolition of the Ghetto in that town. The Ghetto consists chiefly of two streets, Blasia and Coltellini, which are very old, and have been in existence from the time of the Roman settlement. In a map of Modena by Boccabadati, dated 1684, the Jewish quarter is there described as "Recinto degli Ebrei" (Enclosure of the Jews). The origin of the Ghetto, which dates from 1638, is due to Duke Francesco, but already at the beginning of the fourteenth century Modena contained a large number of Jews, who were highly respected and were recognised as being necessary to the place, owing to their great business capacities and to the remarkable ingenuity which they displayed in the promotion of industry and the arts.

BUILDING AND BUILDERS.

THE new schools about to be built at Leytonstone, for which Mr. Wm. Jacques is the architect, will cost 25,000/.

MR. SHINER, of 6 Crutched Friars, London, E.C., is the architect for the new infants' school for the Stifford School Board. The cost is about 5,800/.

THE ceremony was performed on Friday last of the cutting of the first sod for the erection of a new English Wesleyan church at Llangollen. The structure will be built of Cefn freestone, with a well-proportioned spire, and will be of the Gothic style of architecture. It will cost 3,600/.

BUILDING operations are going on at Wood Green in every direction. The largest scheme is that of the Artisans', Labourers' and General Dwellings Company to build as many as 1,400 or 1,500 houses at the Noel Park end of Wood Green at an estimated cost of 500,000/. The houses will consist of six classes and rents will vary from 7s. to 12s. 6d. per week. Close by this estate the London County Council has purchased some 180 acres of land, upon which it is intended to build some thousands of workmen's dwellings.

147 STRAND, LONDON, W.C. (FIRST FLOOR)

A PROPOSAL is afoot for the extension of the Renfrew and Clydebank Joint Hospital at Blawart Hill, near Clydebank. At Monday's meeting of the Board in Clydebank, the clerk (Mr. Hepburn) submitted plans and estimates for the extension, showing the total amount to be 12,809*l.*, made up of 2,900*l.* for the administrative block, 1,460*l.* for six beds in the isolation block, 2,480*l.* for twenty-four beds in the scarlet-fever block, 1,050*l.* for four beds in the acute ward, a total of thirty-four new beds, which, with the thirty existing beds, will make a grand total of sixty-four beds. The remainder of the amount mentioned is made up of items for stables, &c., laundry and fittings, boundary walls, heating, tracks for heating, new boiler, furnishings, &c., and fees. It was further explained that an extension of the ground southward and eastward was necessary, and that the superior had agreed to a renunciation of the present lease, and to grant a new contract for 5½ acres or thereby at the former rate of 25*l.* per acre. The plans and estimates were unanimously agreed to on the motion of Councillor Cornock, seconded by Councillor M'Ghee, with an instruction to the burgh representatives on the hospital board to exercise their best efforts in hastening on the completion of the necessary arrangements. It was also reported that the district committee of the County Council of Renfrew had approved of the extension, but that the burgh of Renfrew had declined to be a party thereto. It was resolved to ask the district committee to join in a representation to the Local Government Board in terms of the minute of agreement constituting the hospital board.

TRADE NOTES.

MESSRS. G. & T. EARLE, the well-known cement manufacturers of Wilmington, Hull, have just issued in attractive form a useful book on "Standard Methods of Testing Cement," with illustrated descriptions, and instructions for the accurate use of the various machines employed. The book, which is carefully and comprehensively written, should be of great utility to cement users, especially as the methods employed have been endorsed by specialists.

CAWOOD, which is on the boundary of East and West Yorkshire, and formerly the residence of the Archbishops, also of Cardinal Wolsey, has had a valuable improvement in the shape of a new chime clock presented to the parish church by

Mrs. Smith, Goole Bank House, Cawood, to the memory of her late husband, who was churchwarden sixty years ago, when the old clock just taken out of the tower was brought from Selby Abbey about five miles away.

NEW FIRE STATION AT SALFORD.

THE new fire station at Salford, which is now rapidly approaching completion, is situated in Albion Place, The Crescent, in the centre of the borough as far as the population, public institutions and manufacturing establishments are concerned. The new buildings cover 5,550 square yards of land, facing Peel Park. The main centre block contains the rooms for the fire engines, each of which can be drawn out at once, as they stand side by side with a doorway for each. Behind the engine-rooms are the stables, and as the horses are brought into position at the engines, the harness, which is suspended above each engine, will drop into position. The stalls of the stables are so arranged that the horses have a direct run to the engines. Close to the engine-room is the call office and duty-room, and behind that is the parade and instruction room. The wing projecting towards the Crescent, to the right of the main block, is set apart as the chief officer's house, and the corresponding wing on the left contains the workshops. There are houses at the back of the station surrounding the drill-ground for seventeen married men and their families, and land has been reserved on which, if necessary, other houses may be built. The equipment of the new station will be most up to date, all the latest appliances having been introduced. There will be facilities for the turning out simultaneously of four pair-horse machines, fully manned, within fifteen seconds from the time a call is received.

The situation of the new fire station is an ideal one, for the roadway immediately in front of the station is 70 feet wide, and leads to the Crescent, one of the widest thoroughfares in the borough. Any part of the borough can be reached in a few minutes, and when the station is in use Salford people will not be loth to admit that the expenditure of 26,000*l.* has not been excessive when the greater security of their lives and property is considered. The Salford Corporation are under agreement with Eccles, Pendlebury, Swinton and other outlying places to attend fires in those districts, and the brigade will be able to reach any such fires much more quickly and in greater force than they can do under the existing circumstances.

MESSRS. MATHER & PLATT, LTD., Salford Ironworks, Manchester, send us a pamphlet descriptive of their automatic sewage appliances and the different systems employed. The photographic views of installations actually at work help very materially to the understanding of the valuable information given.

THE General Electric Co (1900), Ltd., are sending out new price lists of the Robertson incandescent electric lamp, for which they claim the advantages of long life and economy of current; and another dealing with portable accumulators, hand lamps, and electrical accessories for motor cars.

FROM The Willesden Paper Company we have received, in addition to a useful "tear-off" calendar, some specimens of their "Willessden waterproof and rotproof press copying sheets, for which it is claimed, apparently with justification, that it is clean to handle, free from smell, does not crack on the edges, very durable and economical, and the most effective damping sheet in the market," while its price is low.

FIRE APPLIANCES IN THE CITY.

THE county purposes committee of the Corporation have recently presented to the Common Council a report of their proceedings in reference to the fire in Queen Victoria Street in the summer, when ten lives were lost. Having referred to the inquest and the jury's verdict and rider, they stated that they had learned with satisfaction that the London County

Council had procured four 70-foot ladders, and had also decided to try experimentally Pompier ladders, and to make certain alterations which would increase the efficiency of the Watling Street station. The Council had further arranged that every fire alarm which was connected with that station should also be connected with the other City stations. The committee considered that a ready and easy means of escape should be provided from the upper part of every building in the City, that fire-prevention legislation required revision, and that to be effective its application should be made retrospective. They noted with gratification that the London County Council were about to introduce a Bill in Parliament to amend the provisions of the London Building Act, 1894, relating to safety from fire, and they suggested that provision should be made for egress from the upper floors or roofs of all buildings other than the ordinary staircase. They further considered that it was desirable that the Factory and Workshop Act should be amended so as to give increased powers of inspection to the Government inspectors. They were informed that the Fire Brigade committee of the County Council were trying experimentally the keeping of engines at full steam. The suggestion of the jury as to distinguishing street fire alarms by distinctive lamps was being carried out in several parts of London by the local authorities. As to the use of matchboardings for walls and ceilings, the Council were seeking powers to amend the Building Act in that respect. The Corporation committee have received authority carefully to watch and report upon all legislation in connection with fire prevention initiated by the London County Council or any other authority.

AN AMERICAN BUILDER ON FOREIGN LABOUR.

AT the last convention in Washington of the National Association of Builders, Mr. Armstrong delivered an address, in which he said:—

It was my good fortune to spend practically the year of '98 abroad, and the more I saw of the conditions of the labouring men and mechanics there the more pleased I became with ours here, the more proud of this country of ours. Off in Palestine, at Jezrell, on the traditional site of the palace of Ahab and his wicked wife, Jezebel, I saw a building being erected, not one of our "skyscrapers," however, nor yet a replica of the ivory palace of the king, but simply a one-storey hut, such as the

WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

natives have. There was one mason working, and for hod-carriers and mortar-mixers there were two girls. The mortar was made of offal, mud and straw, formed into balls about the size of a croquet ball, and thrown up, one at a time, to a man on the wall, who caught it as we would a ball, spread it, and set the stones. For this these girls got a penny a day, and the man approximately 5 cents. These conditions surely would not suit us, either in the price of labour or the amount of work accomplished.

At the Bergen (Norway) International Fisheries Exposition the United States had the largest and most complete exhibit, yet when I asked the representative of our Government there what part of our exhibit commanded the most attention, he took me to the photographs, exteriors and interiors of the homes of the Cape Cod fishermen, and said "those unquestionably," for the fact that in these little houses there were carpets, pianos and pictures complete, impressed the natives more than all else; one of them only that day said to him, "That is as good as our king has." This is as it should be; a man who is honest, capable and willing to give a full day's work is entitled to enough wage to raise his family, educate them, have his own little home, his bath, his piano and all reasonable comforts, for these enumerated are not luxuries, but are necessities, if man is to be anything above animal.

But for this high wage must come the greatest possible effort. Limitation of labour must never be conceded. Unionism must be taught that the way for them to have work is not to limit the output nor to subdivide what is at hand, but that each should do the greatest day's work possible, that work makes work, otherwise every labour-saving device would be a public calamity. This, gentlemen, should be a principle from which we should never deviate a hair, for our own interests; yes, but higher still, as a patriotic duty, for if the limitation of labour should get the foothold here that it has in England our industrial supremacy will soon be a thing of the past, and we shall share the fate of England.

It is beyond question that the primary cause in the decadence of England's industries has been the arbitrary exactions of the trade unions.

The London papers continue to call attention to the crisis of the British industry, and practically agree that British workmen, through their trade unions, are ruining not only themselves, but the industry of the country.

In travelling through England I found that many towns had practically been killed by trade unions, and could never

quite understand why the evil fruits of their exactions and the consequent loss to themselves did not teach them some valuable lessons, but apparently they did not.

In conversation with our consul at Liverpool relative to this very matter he told me of an incident happening but a day or two previously, which illustrates well the limitation idea. He, in going through a large steamship lying at Liverpool wharves, happened across a carpenter whom he knew, and though it was but early in the afternoon, he there, apparently to work, was seated, doing nothing. Addressing him by name, he said, "Well, John, you seem to be taking it easy." "Oh, yes," was the reply, "I have done my shift for the day," and there he was waiting around for quitting time. Wrong, surely, is this in principle and fatal in practice to both industry and labour.

Again, while staying in London, there was a strike on a near-by building. Upon inquiry I found that someone had been caught "rushing it," as my informant styled it, and they had therefore struck, had him brought before the local union and fined. I then asked him who set the pace. He said "the slow man." If the "slow man" is ever in position to set the pace in America it will be but the beginning of the end of our industrial pre-eminence.

INTERNATIONAL FIRE PREVENTION CONGRESS.

AN International Fire Prevention Congress will be held in London on July 7, 8, 9 and 10, in connection with the International Fire Exhibition at Earl's Court which has already been announced. The primary objects of the congress are:—To discuss the practice of building construction and the application of building materials from a fire preventive point of view; to compare the practice in different countries; and to inquire into the latest materials and systems of construction available, as also the latest inventions for the general equipment of buildings. The equipment of buildings is also to be considered, particularly in relation to the application of electric power and electric light. The views of electrical engineers and fire-brigade officers as to the origin and prevention of electrical fires, including fires caused by lightning, will be received. The legislative enactments in force in cities and districts, particularly in respect of the limitation of area or cubical contents for warehouse buildings and workshops, and the means of separating and uniting such buildings, also

the means of escape in case of fire, will come under review, particularly the regulations governing the construction and control of theatres and places of public resort and the provision of staircases and means of escape for the audience and employées; and those governing the construction of dwelling-houses and houses let in tenements, and the amount of fire resistance to be provided and the means of escape in case of fire. Other points are the best means of watching or inspecting buildings and plant exposed to fire risks without undue inconvenience to owners and occupiers, the practice of fire brigades in this direction, and the experience of the various fire patrol systems; the practice in respect of insurance against fire, and the systems adopted in various countries. The languages to be used in the discussions are English, French and German.

GLASS-MAKING IN GERMANY AND AUSTRIA.

A REPORT has been made from the diary of Mr. Frederick Carder, of the Wordsley School of Art and glass instructor to the Staffordshire technical instruction committee, who was sent by that committee last August to Germany and Austria, with a view of his visiting the glass-making districts and reporting the results of his observations to the sub-committee for the trades of South Staffordshire. In the course of three weeks he visited Berlin, Tschernitz, Dresden, Leipzig, Haida, Reichenberg, Neuwelt, Vienna, Nürnberg and Cologne. The results of his very careful observations are concisely summed up. The workmen of all grades have had a better education than the corresponding workmen in England. This is especially true of the managers, who have either passed through a University or attended for two or three years a course of instruction at one of the various technological schools. Promotion does not go by rotation as in England, but youths who show aptitude and skill are pushed forward. Thus it is that men of ability rise to the top and obtain payment according to their skill. Obsolete and old machinery is at once discarded, and the most up-to-date adopted in its place; and all the machinery is designed to save labour as much as possible. For example, at Ehrenfeld, near Cologne, a machine was in use for melting the tops of wine glasses, tumblers, &c., at the rate of 3,000 an hour. What English factory could work at one-third the rate? Every improvement that comes out in any way affecting the manufacture is immediately adopted, and in any difficulty, specialists,

such as chemists and engineers, are at once called in. In England it is usual to stop work on Friday night; on Saturday the pots are filled with fresh material, and it takes usually from Saturday until Tuesday morning before the men can start work, or say sixty-four hours to melt and fire the glass. In Germany and Austria, on the contrary, many factories melt the glass at night and work it out during the working day of ten hours, while others with a greater number of furnaces are melting and working all the time, both day and night. The loss in dead charges to the English manufacturer in running his furnaces, as compared with the German, must be obvious. In Austria, out of 176 firms manufacturing all kinds of glass, there are 157 furnaces worked by gas systems, and only sixty-five furnaces with the direct firing of either coal or wood, which is invariably used in England. In Germany, out of 341 firms, there are 603 furnaces working by gas, and only ninety-four furnaces with direct firing. These figures show how alive the foreigners are to catch hold of a new discovery. In all the English houses making table-glass to-day not one of them is using gas furnaces, they are working with the same old style of furnace that has been in use for the past 100 years. To go into a German glass-house with its one or even six furnaces under one roof is very different from going into one of our English houses. There the atmosphere is quite bearable and free from the vile smoke, the insufferable temperature and the still worse effects of sulphur which are always in evidence in English glass-houses. The Germans can have their windows and doors in the glass-house wide-open owing to the furnace not being dependent on its own draught, as this is obtained from a tall stack placed in the yard. One cannot wonder that the German maker can work ten hours, whereas the English maker finds it quite enough to work six hours a day. One is also struck with the universal use of moulds, either of wood or iron, which enable the workpeople to produce their goods better, more quickly, and consequently at a lower cost. Better arrangements are adopted for conducting their factories, particularly in their warehouses, where everything appears to go by machinery. Thus, they have a small tramway running round the warehouse, with turntables here and there to facilitate the removal of the goods when packed in cases ready for the markets. The pushfulness of the German commercial traveller is well known, and also his ability to see and seize upon anything on the market, whether it be English, French or American. For example, he will purchase

OUTRAM & CO. WOODVILLE, near Burton-on-Trent.

Excelsior and Rawdon Potteries,

a piece of glass, and send it to his own factory, where it is immediately investigated by the firm with their staff, who at once start producing similar goods which are very often put on the market at half the original price. From Germany and Austria the best English cut glass has nothing to fear; it is only in the common cutting, where the goods are first blown in moulds with the pattern on, and then finally gone over with wheels by girls and women to give them a finished appearance. One or two Belgian houses are doing some very good cutting, some of whose productions are offered at prices for which they could not be cut in England. It is with these houses that we have to reckon, as well as with the French and Americans. In engraving and etching, better work is done in England in the best works than elsewhere. In enamelling, the Germans and Austrians have an advantage in making a harder glass, which stands a higher temperature, and consequently they can do better work. The English manufacturer, on the contrary, contents himself with making only one class of glass, and that with plenty of lead in it. It is thus unable to stand high temperatures without sinking in the muffle. The conditions under which the industries are carried out are more favourable to German and Austrian than to English manufacturers. Fuel is cheaper and the average wages lower.

DUBLIN NEW ELECTRIC-LIGHTING STATION.

THE members of the electric-lighting committee of Dublin Corporation made an official inspection of the Electric-Lighting Station, Pigeon House, on the 7th inst. These works are now in a very advanced state, and it is possible to appreciate the scale on which the enterprise has been approached by the civic fathers, and also the success with which the work has been accomplished. The buildings are situated at almost the extreme end of the Pigeon House. They consist of two large red-brick main structures, one set apart for the engine and generating plant, and the other for the boilers, with their various complicated appurtenances—automatic stoking plant, furnaces, &c. The engine and generating plant room is a very lofty apartment. In it two engines capable of indicating 800 horse-power have already been practically completed. These, however, are the smaller of the two sets with which the room will be equipped, the other two engines being capable of indicating 2,000 horse-power each. The fly wheels of

the smaller engines are 14 feet in diameter and weigh nearly 27 tons, whereas in the case of the larger pair of engines the diameter of the fly wheels will be 17 feet and the weight nearly 40 tons. The larger engines are at present only being laid down. For this work an overhead travelling crane is used, capable of lifting and carrying 25 tons, and itself weighing 17 tons. By its instrumentality the nicest possible adjustments are made. The alternators, which are also rapidly nearly completion, are four in number, two being capable of developing 1,000 kilowatts each and two 500 kilowatts each. As already announced the system adopted for the Corporation scheme is that known as the three-phase system, which will insure great convenience and economy in working. The switchboard will be of the most approved modern type, all its vital parts being placed on the one side in full view of the operator, and thus, owing to the wise determination of the committee to adopt the chairman's views on this matter, the work of superintending and tending the machinery will be rendered incalculably less dangerous. In the engine plant, too, economies of an important order are observed. By the most up-to-date system of steam condensation an economy in fuel and in water supply is insured, the water being supplied practically hot to the boilers. In the boiler-house—which is also in an advanced state of preparedness—ten boilers are in course of erection. Four of these, of the water-tube variety, are practically complete, and are now ready to undergo a very severe hydraulic-pressure test. The gases from the furnaces of these ten boilers on their way to the chimney pass through two economisers, consisting of a nest of cast-iron tubes, through which the feed-water for the boilers is heated up to boiling-point before being pumped into the boilers. These economisers are now complete and ready for being enclosed by the brickwork of the flues. The automatic stoking arrangements also tend much towards economy, and in this connection the convenience of getting the coal supplied from the vessels direct will be much appreciated. The walls of the boiler-house are, as in the case of the engine-room, of red brick, and there are open arches along the side facing to the north. This arrangement, of course, is made having regard to the great heat that will be developed inside the building when all the plant is in full working order. During the past few months considerable progress has been made in the various sections of the work, and, as far as present appearances go, the Dublin public may expect to see the station in full working order by June next.

RURAL DRAINAGE.

AT the ordinary general meeting of the Surveyors' Institution held on Monday, the president, Mr. Arthur Vernon, in the chair, Mr. H. T. Scoble, professional associate, read a paper on "Rural Drainage and Sewage Disposal." He said no cut-and-dried system capable of universal application could be recommended. He gave a résumé of several letters on the subject which had appeared in the *Times* in September 1901, and a short description of Dr. Poore's system, with remarks on the value of effluents and reasons for the establishment of watershed authorities. Having reviewed the publications of the Royal Commission, and considered the progress of bacterial treatment, he discussed the progress of pathogenic and other bacteria in effluents, and Mr. Scoble summed up the position as regards rural affairs. He particularly drew attention to the very onerous conditions insisted on by the Local Government Board, conditions which must be altered ere the solution of this most important question could be attained. In the event of an existing method of sewage disposal in a country district being condemned, if recourse were had to a Local Government Board loan it became necessary to deal with no less than six times the normal dry weather flow, three times to be fully treated as ordinary sewage and the other three times on storm filters or special plots of land set apart for this purpose. The Local Government Board still fondly clung to land for final purification, failing to grasp the fundamental principle that bacterial treatment was essentially only an improved form of land treatment, wholly under control and efficient in all states of the weather. Where works could be constructed out of revenue, sufficient purification for all practical purposes could be attained with far less grandiose schemes. Existing methods of disposal in places where the population was not rapidly increasing would generally suffice if the importance of thoroughly attending to their duties were brought home to responsible officials and individuals. It would be well could regulations be framed to prevent the erection of many contiguous dwellings without a really sanitary system of disposal. Each problem must be considered on its merits, utilising or adapting existing arrangements. It might be taken as established that, where sewers were adopted, bacterial treatment possessed so many advantages that it should supersede all other systems. A vote of thanks was passed for the paper, discussion being adjourned for a fortnight.

NEW WASHHOUSES FOR EDINBURGH.

STOCKBRIDGE public washhouses, which the Town Council of Edinburgh have erected as an adjunct to the Bedford Street improvement scheme, were opened formally on the 7th inst. It was originally proposed that such an establishment should form a part of that scheme, but difficulties presented themselves on account of the improvement scheme committee not having powers to use any part of the funds at its disposal for such a purpose, or to restrict the use of the washhouses to persons affected by the improvement scheme. After a good deal of discussion it was resolved ultimately to erect the washhouses for general public use, and to carry this into effect the work was ultimately remitted to the plans and works committee. The building, which is of brick, consists principally of a large hall for washing, wringing and drying clothes, and an office for the ticket clerk on the ground floor, a crèche for children and a room for the attendant upstairs, with pumping and electric machinery in the basement and a boiler-house adjoining. The large hall, which has glazed brick walls with a light iron and glass roof, is well lighted, and accommodates forty washers. In each stall there is a steam boiling trough for the preliminary cleansing of the clothes, and a rustless washing tub. After the clothes are washed they are placed in the hydro-extractors, or wringers, which partially dry by centrifugal motion. Instead of being steam-driven as ordinarily, these are worked on the turbine principle, by water under pressure from a powerful steam pump. Ample hot-water services and steam are laid on to each division. This is generated by means of calorifiers placed in the basement. The clothes are dried in a long chamber placed on one side of the building, which is heated by means of a powerful electrically-driven fan working over an enclosed battery of steam pipes. The principal contractors for the builder's work were Messrs. James Kinnear, Sons & Co. Messrs. Mackenzie Brothers were responsible for the engineer's work, and the whole was carried out several months within the period provided for in the contract. The utmost economy has been observed in the treatment of the building, in which, being of the most plain and substantial character, and lying as it does in a somewhat narrow lane, architectural features have been sternly repressed, the most prominent feature being the chimney-stalk, which rises to a height of 100 feet. The cost approximately, exclusive of the value of the site, is 4,500*l*.

BELFAST BUILDING TRADE.

THE last few years have not, according to the *Belfast News Letter*, been very flourishing ones for Belfast builders. The boom of five or six years ago was bound to be followed by a reaction, and unfortunately that reaction was intensified by the effects of the struggle in South Africa, which hit hard at almost every department of industry. People were loth to tie up money in house property, street extension showed a marked falling off, and the erection of artisans' dwellings, which had been one of the main branches of the business, was last year far below the average. Then, almost at the worst period of depression, came the prolonged strike in the carpenters' trade, and to some it seemed as if the industry was irrevocably doomed. Undoubtedly the blow was a severe one, but after many months of conflict an arrangement was arrived at satisfactory to both parties, and the settlement is such as to preclude the possibility of a strike of a similar nature occurring for some time to come. It is satisfactory to learn that trade for the past twelve months is much better than for the previous year, and shows a tendency to improve still further. The cost of materials has not undergone any extensive changes during the year, and the most amicable relations have existed between masters and men. The construction of artisans' dwellings still remains a depressing feature, though the want of work in this respect is not so keenly felt, and house property is beginning to go off once more. Intense interest was aroused in this trade by the "Mountpottinger ancient lights" case, and it is stated that if the decision of the Master of the Rolls is upheld on appeal, it will have a very adverse effect on builders in the city. In some quarters it is said that the result will be to hinder the development and reconstruction of the older portions of the town, as property owners will be disinclined to make extensive alterations in their premises lest they should trench on the lights of adjoining proprietors. In spite of these things the outlook for 1903 is not one of unrelieved gloom, and the construction of a better class of buildings, which has been the feature of 1902, augurs hopefully for brighter times in the future. A stranger to our city, however, might well be excused if he declined to accept these rather lukewarm statements regarding the position of the building trade, and declared that nowhere else had he seen such activity manifested in this industry. That is the first impression of the visitor, for in the heart of the city he hears the clink of trowel and hammer

above the din of the traffic, and his vision is arrested by great walls veiled in scaffolding and swarming with hundreds of busy workmen. Trade may not be as prosperous as could be wished, but undoubtedly the exertions of the builders are rapidly transforming Belfast. By a rather strange coincidence all the greater contracts now being carried out are in the centre of the city and at almost a stone-throw from each other. First in order of importance is the new City Hall, whose graceful lines hold and charm the eye of the observer. The outer stonework is now well on the way to completion, and there is little doubt that when finished the edifice as far as artistic design is concerned will stand high in the list of public buildings of a similar kind throughout the kingdom. The Scottish Provident Institution's gigantic building on the west side of Donegall Square has been completed during the year, and its appearance realises all the expectations which were formed regarding it. It is in every way worthy of the position it occupies, and makes a fine contrast with the new City Hall. The splendid premises of the Ocean Accident Company on the east side of the square are notable for their graceful design and novel appearance, and bid fair to become one of the show buildings of the city. The Northern Banking Company have carried on their work with great expedition, and their new bank is one well worthy of the reputation of the firm and a fine example of architectural skill. In College Square building operations are in full swing at the new Municipal Technical Institute, the foundation-stone of which was laid with fitting ceremony by the Lord Lieutenant during his recent visit. When this institution is completed it will prove not only a worthy home of technical education but will also constitute a notable example of what technical knowledge carried into practical effect can achieve. The new Assembly Buildings on the site of Fisherwick Church, which has been pulled down during the year, are going steadily ahead and have now reached the height of one storey. In some respects they are a most ambitious attempt in this direction by the Presbyterians of the city, and judging by the enthusiasm displayed the hopes of those responsible for their erection will be more than realised. The colossal warehouse of Messrs. Fulton & Co. near the Great Northern Railway Company's terminus is now completed, and adds not a little to the appearance of this street. Good work has also been done on the new Royal Victoria Hospital, and Messrs. Wright & Hunter's new warehouse in Arthur Street bids fair to be one of the finest buildings of its kind in the city.

THE AUCTIONEERS' INSTITUTE.

THE Midland Counties Branch of the Auctioneers' Institute held its annual general meeting at Leicester on the 8th inst., under the presidency of Mr. D. N. Royce, of Oakham. There were also present, as representing the Council of the parent institute, Mr. W. Bennett Rogers (past president, London), Mr. W. Roland Peck (past president, London), Mr. Thomas Grimley (chairman of the Birmingham and District Branch), Mr. Edwin Partridge (Derby) and Mr. Charles Harris (secretary, London). The Chairman was also supported by the following local members:—Messrs F. Tarratt, J. H. Tarratt, V. H. Tarratt (local hon. secretary), H. T. Hincks, J. Shakespeare, J. J. Curtis, T. H. Ford, A. H. Miller, G. Attenborough, V. J. Whittle and G. F. Brown, all of Leicester; E. Wallon, W. Hanson and J. Press, of Nottingham; J. Ashley and G. Loveitt, of Coventry; Jos. Rowland, Burton-on-Trent; T. T. Finney, Derby; S. H. Situs, Melton Mowbray; J. Pickard, Birmingham; and J. Styles, Rugby.

The Chairman, in moving the adoption of the annual report, said the branch now numbered seventy-six members, and that, after providing for the year's expenditure, there remained a balance in the hands of the treasurer of 30s. During the year twenty-two applications for admission to the parent Society had been considered and reported upon to the Council. The question of the subdivision of the branch had now taken definite form, and only just recently a new branch, to be called the "Birmingham and District Branch," had been sanctioned by the Council and formally inaugurated. The area to be embraced by it would include the counties of Warwick, Hereford, Worcester, Shropshire and Stafford, with the exception of the town of Burton-on-Trent.

The report was received and adopted.

The officers for the ensuing year were then elected by ballot, Mr. J. Cumberland, of Derby, being unanimously elected chairman, and Mr. W. H. Tarratt, of Leicester, hon. sec.

The Chairman, in responding to a vote of thanks for his past services, said it was most gratifying to know their Institute now numbered over 1,500 members, and, as an instance of what the Council were doing, he mentioned that he had within the last few days received a letter from the secretary with reference to a proposal to hold the examinations of the Institute in the great provincial centres concurrently with those in London. He thought it was most essential that they should encourage their students to thoroughly qualify for their pro-

fession, and to take the places of the older men as they passed away. The committee had carefully considered the question of fixing a scale of charges, but, seeing that the branch covered such a large area, and that customs were so variable, they felt that at present they could not adopt any scale which would give satisfaction to all. He very much regretted that the strong representation made by the Council to the Inland Revenue Board that they should insist upon all valuations for probate being made by licensed valuers only had not been acted upon, and he hoped the wrong in this matter would soon be put right. The position of the valuer should, he thought, be considered, as they wanted what was right and nothing more. He considered that no one profession should be allowed to poach upon the preserves of another. The valuers of this country were an important body of men—especially when they considered the many millions which they were called upon to value every year. He had great pleasure in moving that the branch should give out of their funds a donation of ten guineas to the benevolent fund of the Institute.

This was seconded and carried unanimously.

The members then lunched together at the Grand Hotel, and, after the loyal toasts had been honoured,

Mr. W. B. Rogers proposed "Success to the Midland Counties Branch." He thought these local branches were the mainstay of the parent stem, and was delighted to see the Midland branch in such a thriving condition. He thought that the honorary secretary especially had performed his duties in a most praiseworthy manner.

The Chairman, in replying, said he hoped they had done something to help forward the good work of the parent society, and that would always be their aim.

Mr. Wallon then gave "The Auctioneers' Institute," to which Mr. W. R. Peck responded. After alluding to the great help received from their ten local branches, he said he deeply regretted that the Council of a kindred institution had seen fit to oppose their recent application for a royal charter. He thought they had taken the course they had from a want of knowledge of the real objects and aims of the Auctioneers' Institute, though he hoped the day of their enlightenment was not far distant. At all events, he could not believe the opposition came from the general body of the members of the opposing institution. The Council of this Institute had firmly resolved to improve the profession of auctioneer and valuer, especially in the matter of education and training. He particularly urged all present never to miss an opportunity of

urging their pupils and assistants to qualify by passing the examinations of the Institute.

Mr. Francis Tarratt proposed "Success to the new Birmingham Branch," and Mr. Grimley, in responding, said he was happy to say they in Birmingham had very high aims with regard to the branch and the Institute generally; that being so, he was quite sure of the support of gentlemen in the first rank in Birmingham and district.

Other toasts followed, and the meeting concluded with a vote of thanks to the Chairman.

BIRMINGHAM TENEMENT DWELLINGS.

It is rarely that private enterprise is directed towards the subject of the housing of the working classes on the "flat" system. Experience has shown that it does not offer sufficient inducement by way of interest on capital. Most of the large schemes, such as the Guinness Trust, the Peabody Buildings, and those erected by municipalities, are either philanthropic or are subsidised by the rates. Mr W. B. Cregoe Colmore (who is the owner of considerable estates in Birmingham) and his trustees have had under consideration the desirability of endeavouring to provide dwellings for artisans in the centre of the city, and have decided to build as an experiment a block of tenements on a piece of his own land at the corner of Hospital Street and Henrietta Street, near the bottom of Snow Hill. The scheme is not a large one, but if it should be attended with a fair measure of success it will probably be largely extended. Considerable time and thought have been given to the plans, and it is believed that they will be found to embody all that is best in the existing schemes, and in many ways will be in advance of anything yet attempted. It is not proposed in the present scheme, says the *Birmingham Post*, to accommodate the very poorest class, but rather those whose earnings are small, and who, from desire, and oftener from necessity, live in the centre of the city. The building, which will have a frontage to Hospital Street of 95 feet, will be four storeys in height, and will contain twenty-four tenements, sixteen of which will be two-roomed, and eight three-roomed tenements. The tenements will not be all communicating, as in some flats, by an internal corridor or out-side balconies, but they will be divided into three separate blocks, under one roof, each having one staircase. The staircases will be constructed of stone, having easy steps;

they will be well-lighted and ventilated. Each tenement will be what is known as "self-contained." The living rooms will be of ample size, and will measure in each case 140 superficial feet; the window will be recessed, and the space thus formed will contain a dresser, with a ventilated food cupboard. Leading from each living room is planned a scullery, containing a sink, a copper, a bath, a plate rack and a chopping block. Beyond the scullery and disconnected by a small area is a water-closet, one being provided for each tenement. In the dis- connecting area space is found for a coal bunker, and there will be also arranged a shoot for ashes, which will discharge into a receptacle on the ground floor. The bedrooms will measure 120 superficial feet. In the three-roomed tenement the second bedroom will be smaller, but each will be provided with a fireplace. Ample space will be left at the rear of the building which will be paved and used as a drying-ground. The flat roof often provided for this class of building will be avoided, because experience proves it to be useless as a drying ground or a playground, and a flat roof to a four-storey building tends to give it a factory or barrack-like appearance. The top storey will be partly in the roof, the roof being Mansard shape.

The design of the elevation is considered an important matter, and an attempt has been made to free it from the usual ugly appearance of such buildings and retain a distinctly domestic character. The buildings will be faced on all sides with a good red brick, the slates of the Mansard roof will be green, and the external woodwork will be painted. The sills of the windows will be made to receive flower pots. The roof will be boarded, felted and slated. The floors of the living rooms will be laid with small hard wood quarries, and the bedroom floors will be of wood block. The floors of the building throughout will be fireproof, and special precautions will be taken to make them as far as possible soundproof. An important point in the plan is that every room can be entered separately from the entrance lobby without going through another room, the objection against bedrooms opening directly from living rooms, as is the case in almost every tenement building, is thus overcome. The greatest care will be taken in all matters of detail; the walls will be plastered and "Duresco" coloured; a cement-painted dado will be provided for the living rooms; door frames will be iron; doors will be strongly made; window frames will be solid; wrought-iron opening casements will be provided to each window hinged on pivots top and bottom.

WORCESTER NEW COUNTY ASYLUM.

MR. M. K. NORTH, M.Inst.C.E., Local Government Board Inspector, last week held an inquiry on behalf of the Board at the Shirehall into the necessity for the loan of 215,887*l.* to be taken up by the County Council for the erection of a new lunatic asylum at Barnsley Hall, North Bromsgrove. There were present Messrs. J. W. Willis Bund (chairman of the County Council), J. Bowen (chairman of the building committee), S. Thornely (clerk to the County Council), R. J. Oliver (committee clerk), W. J. Moody (finance clerk), G. T. Hine (architect), G. Kenrick (quantities surveyor).

Mr. Thornely said the present indebtedness of the county amounted to 103,865*l.* The amount required for the asylum was 215,887*l.*, but in addition to sanction of that loan they wanted a provisional order to borrow 300,000*l.* beyond their present borrowing powers, *i.e.* 483,667*l.* This was made up of 188,787*l.* required for the new asylum, 103,867*l.* present indebtedness, 19,900*l.* loan being negotiated, and a working margin for loans 144,013*l.*, which was inserted, as the Board recently told the Oxfordshire County Council that such a provision for future loans should be included in such applications.

Regarding the necessity for the asylum, Mr. Thornely said present asylum, built in 1851, was situate at Powick. It is a joint asylum, belonging one-ninth to the city of Worcester and eight-ninths to the county. At the present time it was full, patients were being sent to other counties. In 1898, when Lunacy Commissioners first complained of inadequate accommodation, there were 1,137 patients. These had increased in 1900 to 1,145, when attention was again called, and in 1901 to 1,166. A site had accordingly been purchased near Bromsgrove for 1,700*l.*, on which to build a new asylum.

Mr. Hine said the new asylum would accommodate 570 patients. The water supply would be procured mainly from the moles on the estate, which had been certified to yield 100 million gallons of water, and the remainder from the East Worcestershire Company. Nothing had yet been decided as to the method of sewage disposal, but it would probably be the sewerage system, with land treatment. The builder's contract

amounted to 151,475*l.* The building would be of red brick with terra-cotta facings, and the bottom floors and top ceiling would be fireproof. Fireproof staircases would also be provided. The building would be lighted with electricity and heated by the low-pressure steam system. There was a home-stand on the site, and the existing farm buildings would be utilised as much as possible.

Mr. Willis Bund said the new asylum had been forced on the County Council by the Lunacy Commissioners, who had been at them for some years to get it done. The new asylum would be for the county alone, and he explained that the reason why the Powick asylum had filled up so quickly was that besides county patients it took patients from the county boroughs of Worcester and Dudley.

The inquiry was then closed, and Mr. North proceeded to Bromsgrove to view the site.

THE HOUSING PROBLEM IN GLASGOW.

ACCORDING to the *Glasgow Herald*, Mr. Thomas Nisbet, the Master of Works, gave the following evidence before the Glasgow Municipal Commission on the Housing of the Poor, Sir Samuel Chisholm presiding. Mr. Nisbet submitted a statement in which he said he had compared the average number of one and two-apartment houses for the erection of which authority was given by the Dean of Guild Court during the last three years with the average number during the three years from 1872 to 1875 (1872-73 being the first year when the Dean of Guild Court return was prepared in the same manner as at present). He found that of one-apartment houses the average number authorised in the three years from 1889 to 1902 was 496, whereas from 1872 to 1875 the average number was 1,177; and of two-apartment houses the numbers were 1,583 for 1889 to 1902, and 2,332 for 1872 to 1875 respectively, showing that in 1872 to 1875 far more provision was being made for the poorer classes than in 1889 to 1902, and that, too, although in the former year the city was less than one-half the size it was in the latter years, and had much less of a population. For 1872-75 the average number of one and two-apartment houses authorised was 24.83 per cent. and 48.48 per cent., respectively, of the average total number of houses authorised, whereas in 1889-1902 the percentages were 15.52 and 46.24 respectively. If the three years 1866-69 be compared with the three years 1899-1902 it will be found that

A splendid example of COLOUR-WORK in Permanent Ink Photo by M. PAUL
ALBERT BAUDOIN.

In consequence of the almost daily demand for these plates, they have been reproduced by Subscription at Half a
Guinea the Set, and are now ready for issuing. Free by post, carefully packed inside patent roller.

GILBERT WOOD & CO. LTD., 6-11 IMPERIAL BUILDINGS, LUDGATE
CIRCUS, LONDON, E.C.

in the former of those periods (1866 being the year of the first City Improvement Act) of the average total number of houses authorised in each year, 25.64 per cent. were houses of one apartment and 48.77 per cent. were houses of two apartments, as compared with 15.52 per cent. and 46.24 per cent. respectively during the latter of those periods. During the past year, in which the value of the linings granted in the Dean of Guild Court exceeded largely that of any previous year, the one and two-apartment houses authorised only amounted to 11.42 and 45.20 per cent. respectively of the total number of houses authorised. He was satisfied that the number of sanitary and healthy houses available for the poorer classes, at rents that they could pay, was quite inadequate to meet the demand. He was also of opinion that as private enterprise was not providing, and was not likely to provide the requisite accommodation, it was the duty of the Corporation to do so. He could not imagine any good reason for supposing that the Corporation could not build as cheaply as any other body or person. The same architects and measurers and the same contractors would do the work for the Corporation at rates certainly not greater than would be charged to others. The number of illegal apartments was being regularly added to by the erection of new buildings for business purposes. In addition there were houses which might be closed under the thirty-second section of the Act of 1890. But action was not taken because of the insufficient number of empty houses and the practical difficulty of the three certifying officers examining simultaneously and personally. Recently that difficulty had been removed. He found that of one-apartment houses the average number authorised by the Dean of Guild Court in the three years from 1899 to 1902 was 496, whereas from 1872 to 1875 the average number was 1,177; and of two-apartment houses the numbers were 1,583 and 2,332 respectively. He could not give any reason for the lack of provision of cheap houses. Possibly the Building Regulations Act might have some effect, but he scarcely thought it could be serious. If a builder was likely to get a fair return he would provide cheap houses, and the Corporation could build as cheaply as any other body or person. If there was any difference the advantage would be with the Corporation, as there would be no risks. As private enterprise was not providing the requisite accommodation, it was the duty of the Corporation to do so, but he had not thought out any scheme as to how that duty was to be fulfilled. The practice of making-down houses had practically ceased.

By Mr. Brand: A large majority of those inhabiting the houses that he thought should be pulled down were rather dissipated. It was for the Corporation to decide whether the Acts should be enforced and these people expelled. Witne had not considered whether the reason that there were few houses for that class provided than formerly was that it was undesirable property.

By Mr. W. F. Anderson: He thought a large number of apartments falling to be closed under section 40 of the Act of 1900 ought to be closed even apart from that provision. He believed it was the mind of the Corporation that, as there were not houses of a sanitary class at a price within the reach of these people sufficient to house them, the section should meantime be enforced. Personally he would act gradually under the section. He had written to the clerk of police regarding his unsatisfactory position, inasmuch as there was no minute that he was to carry out the section, while there was a clear understanding that he was not to carry it out. Witne was not aware of any houses being built at rents of 6s. 6d. under. He knew of a case in which a public-house which had been closed was being converted into four single-apartment houses.

Professor Glaister: Is it within your knowledge between 1866 and 1876 one-fourth of the inhabited houses in Glasgow were built, and that 93 per cent. of these houses were of one, two and three apartments?—I have no knowledge of the proportion of the whole number of houses in the city cannot imagine that it is as you state.

Is it the fact generally that in the period mentioned there was an abnormal building of one and two-roomed houses? There was an abnormal building of all kinds of houses from 1868 to 1876.

Mr. Goldie: Is it within your knowledge that sometimes the supply of houses gets beyond the demand?—No, I say that. There is nothing whatever to prevent houses being made down to meet the demand for cheap houses.

And if the demand takes place it will be supplied before?—I do not know that.

It must occur to you that the private builder can build cheaper than the Corporation, because very often, on account of his skill in his own trade, he is able to do away with measurers and so on, which the Corporation must have?—mason of course would not have his work measured. The number of builders who are in that position are comparatively few.

Professor Smart: Do you not think that one reason why small houses are not being built is that the Corporation have not enforced the provisions of their Act of 1900, and that if it were enforced it building would again go on by private persons?—I have no doubt that building might go on. It must be remembered that it takes some time to provide houses, and that if the Act were put in force at once people would have to be turned out of their houses without accommodation. Builders knew that the Act came into force two years ago, but they did not know that it would be in abeyance, and consequently they did not make an effort to provide houses.

Do you know if the requirements of the 1900 Act are more stringent than in other towns; are we in advance of other towns?—I don't know.

If wages are not rising we may possibly be asking builders to build houses which the tenants cannot pay for?—I really cannot say; I have not studied the question.

Are you of opinion that there is a class in the city who are unable to pay anything but slum rent?—There are poor people in the city who are not able to pay any but the smallest rent.

Do you know that a good house has a productive value, that is, if you put a poor man into a better house he will become a better worker and earn a better wage?—I have not considered that question at all, and therefore do not feel qualified to give an opinion on it.

I rather gather from your whole precognition that you regard the decrease of the one-room house as a thing to be explored?—Oh, no. I do not think that is so. I merely state facts in my precognition.

Is it not the fact that we have been rather congratulating ourselves of late years on the fact that we have been getting rid of the one-room house?—I do not know what you have been doing; I have not been doing that.

Do I understand that you approve of the one-room house?—There is a class of people who could not pay for anything else. There are a considerable number of old people, for instance, who can live in one-room houses quite comfortably and healthily.

Do you think that if you advised the Corporation to build one-room houses, it would be difficult to prevent better-class people getting into them?—I am not going to advise them. All I have said is that people must get houses to live in. If private enterprise does not provide them, the Corporation must do so.

Mr. Gray: Do you think private builders would supply houses for the class of people who occupy ticketed houses?—I do not think they are doing it in the meantime.

Do you think they will do it?—I do not know.

By Mr. A. Murray: Speaking generally, a larger number of people were now able to live in bigger houses.

By Mr. Brand: It was the duty of the Corporation to enforce sections 32 and 40 of the Acts. He had no power under section 40 except by delegation from the Corporation.

By the Chairman: In addition to the illegal apartments in which 20,000 people were sleeping, there were a great many houses which did not come within the scope of any of the Acts, but which were unsatisfactory for residential occupation.

You believe that there is a serious housing question in the city?—I believe there is.

Additional apartments were being made illegal by the erection of buildings adjoining not of a domestic character, but possibly of a warehouse character, because the builders of the houses had erected their buildings trusting to open space which was not in their own ground?—Yes.

Would you suggest that no builder should be allowed to erect houses for occupation unless he had in his own ground sufficient space for light and air?—That is now provided for, so that it cannot take place in respect of new buildings but only in respect of existing buildings.

In regard to the existing supply of houses for those 20,000 people, we have been told that the number of one and two-apartment houses which are being erected varies each year, and it has been suggested that the variation arises simply from the question of supply and demand. Do you think that is the only question affecting the variation?—No; supply and demand could never cause the variation shown in the returns. Probably the condition of the money and the labour market affects the number of houses that are erected.

Do you think that the supply of houses for the people stands precisely on the same platform as the supply of commodities, manufactured and otherwise? Supposing bread was very dear, would you ever suggest that the Corporation should begin to make a supply of bread?—If the people were starving they certainly would.

That is to say, they would give it away as charity?—Not necessarily.

Is the supply of houses in the position of the supply of commodities?—Yes; I think it is very much on all-fours.

You do not suggest that the Corporation should build

necessarily, but only that if private builders do not the Corporation should step in?—Yes; people must have houses.

Does the state of matters in Glasgow just now warrant the Corporation considering very seriously the propriety of taking action?—I think it does.

By Professor Glaister: The houses which he described as unsatisfactory could not be touched from the point of view of health or legality. The difficulty was the provision of proper access.

By Dr. Howie: If the Corporation were to provide the houses in question, that would tend to restrict private enterprise.

By Mr. W. F. Anderson: Do you not think it would have the same effect as the lodging-houses had in stimulating private enterprise?—I do not know it has had that effect.

AN INSECURE TARPULIN.

At the Chichester Infirmary on the 10th inst. Mr. J. W. Loader Cooper, coroner, conducted an inquiry into the circumstances attending the death of John Thomas, a stonemason, employed at the Arundel Castle works, who expired at the institution on Thursday from the effects of an accident sustained while at work on the previous Monday.

Mr. W. F. E. Seymour, from the Home Office, one of H.M. Inspectors under the Factories and Workshops Act, was in attendance.

George Hinks, brother-in-law of the deceased, living at Thakeham, Pulborough, gave evidence to the effect that deceased was fifty-nine years of age, and was a very sober, industrious man.

John George Russell, manager of the works being carried on at Arundel Castle by Messrs Rattee & Kett, produced plans and photographs of the works, and explained very explicitly the circumstances under which the regrettable accident, the first during a period of twelve years, occurred. On the day in question workmen were engaged in making alterations at the top of a turret, taking the roof off the turret which covered the turret staircase. The deceased was upon some scaffolding about 37 feet above the roadway. The scaffolding was protected in the ordinary way with a guard-rail, and towards the south-west there was a tarpaulin put up to protect the men from the weather. It was hung between the south-west wall and the

turret. When the accident occurred, a fellow workman of the deceased came to witness with information of it, and he at once made arrangements for medical assistance, after which a conveyance was obtained and in half an hour's time the deceased was on the way to Chichester Infirmary. Deceased had been employed on the works over eleven years, and was a very sober and hard-working man.

Tom Mayo, stonemason, who was engaged at work with the deceased, stated that about ten minutes past two on Monday afternoon a gust of wind caught the tarpaulin sheet, knocking the deceased off the scaffolding down the turret staircase. He was at the time engaged in putting a support, consisting of a piece of wood—commonly called a "straight edge"—10 feet long and 5 inches wide, against the tarpaulin to prevent it blowing out. It was a rather windy day, and when the gust of wind caught the tarpaulin it blew deceased through the open doorway, over the guard wall below, and down the turret staircase as far as the thirteenth step. Witness went down at once and picked him up. Deceased did not speak, and was apparently unconscious. Everything possible was done for the injured man, and witness subsequently accompanied him to Chichester.

Replying to the foreman of the jury, the witness explained that the tarpaulin was tied to its frame, and there was a piece of cord in the middle to keep it in its place, but there was some play, and the wind caused it to suddenly bulge out like a sail. It was a tarpaulin 12 feet square. Deceased was face upward when he picked him up.

George Kiern, labourer, Lyminster, confirmed the evidence of the last witness.

Mr James Sands Elliott, house-surgeon at Chichester Infirmary, gave evidence as to the admission of the deceased to the infirmary. He was suffering from concussion of the brain and was unconscious. At the back of the head there was a scalp wound 4 inches long which exposed the bone. Over the front part of the head and forehead there was extensive bruising. Both eyes were black. There was also slight bruising about the shoulders. Deceased's condition gradually became worse, he never regained consciousness, and died about midday on Thursday. In his opinion the cause of death was fracture of the base of the skull, the result of the fall which had been described by previous witnesses. It was a hopeless case from the first.

The jury, upon this evidence, returned a verdict of "Accidental death."

The Architect.

THE WEEK.

MR. HENRY TANWORTH WELLS, R.A., who died on Friday, the 16th inst., had for forty years been recognised as a successful portrait-painter. There was no artist during that time who was more capable in suggesting the qualities of English womanhood, and no painter's works should be regarded hereafter as more indicative of the domestic virtues of English ladies in the nineteenth century. From the excellence of his characterisation he may not have been a favourite with those who wished to appear on canvas as if they were extraordinary beings who lived on admiration alone. He was born in London in 1828. At first he practised as a miniature painter, but like others he found his occupation gone through photography. Fortunately for himself he was competent to work in oils. He rarely attempted subject pictures. In 1866 he was elected an Associate of the Academy, and four years afterwards became an Academician. There could hardly have been a more loyal and conservative member. He looked upon the Academy as a perfect institution, and was indisposed towards any alteration in its arrangements. Lord LEIGHTON recognised his qualities by selecting him to be his *locum tenens* during his illness. One of Mr. WELLS'S daughters married Mr. ARTHUR E. STREET.

THE special appeal committee of the Governors of St. Bartholomew's Hospital acted wisely on Monday in coming to the following resolution:—"That having regard to the criticism upon the proposed appeal for the enlargement of St. Bartholomew's Hospital, based on inaccurate information, a committee be appointed to report, first, whether it is desirable in the public interest and on financial grounds to retain St. Bartholomew's Hospital on its present site; secondly, in the event of the retention of the hospital on its present site, whether any better scheme of rebuilding than that suggested by the Governors can be devised; thirdly, upon any other matters affecting the hospital that the committee may think it desirable to inquire into." The agitation about St. Bartholomew's is no more than a repetition—it may be on a larger scale—of that raised by the Manchester Infirmary. An hospital which is established in one place during a great many years is generally looked on by the public, and especially by those who are likely to utilise it, as a fixture which cannot be altered without causing general inconvenience. On the other hand, there is no doubt that the sanitary condition of an old hospital is imperfect. When, as in Manchester and in Smithfield, the surrounding buildings have become larger in size, there is also an advantage in removal to a more open district. All such problems present many complex aspects, and much can be said for and against each of them. In Manchester several years have been occupied in endeavouring to satisfy all parties, but in vain. Not only has much money been spent on plans and inquiries, but still larger sums have been lost because some subscribers were discontented. The final arrangements seem to be as far away from realisation as ever. We hope the Manchester case will be taken as a warning by all interested in St. Bartholomew's. It is possible to have interminable discussions over reconstruction, and unless there is some compromise between extreme views, the hospital is sure to suffer.

WHEN Greek meets Greek, it used to be said, then comes the tug-of-war, and when one contractor starts to criticise another the allegations are likely to be unlimited. The law, however, does not make allowance for the knowledge which is displayed in discovering what are supposed to be weak points, nor will a critic be excused if he should appear as an angry ratepayer. Mr. GEORGE HAYLES, who is a builder and contractor, owns property in Wilton Road, Shanklin, which the Urban District Council resolved to have sewered, levelled, metalled, &c. Mr. DANDRIDGE

obtained the contract, which he carried out under the Council's surveyor and the clerk of works. While the works were in progress Mr. HAYLES informed the Council that the contract was being carried out in a barefaced, scamping manner, and gave particulars of defects. An inquiry followed, which showed there was no ground for the charges. Mr. HAYLES was not to be convinced and declined to pay his proportion of the expenses. The magistrates having ordered the payment, he appealed to the King's Bench Division without success. As the charges were mentioned at the meeting of the Urban Council and thus made public, Mr. DANDRIDGE was compelled to bring an action. The defendant pleaded that he wrote as a ratepayer and frontager, and his letter was privileged. At the trial before Mr. Justice RIDLEY and a special jury, the defendant was desirous to call evidence to show that the work was not carried out in accordance with the specification, but the judge intimated that such testimony would not affect the question raised by the case, which was whether the plaintiff had satisfied the surveyor, as it was said he had done. The case of the defendant, therefore, rested upon the plea of privilege and absence of malice. The jury returned a verdict for the plaintiff with 50% damages.

WHEN the Giffard injector came first into use in this country it was generally regarded as a philosophical puzzle. There was no question of its superiority in forcing water into a boiler, which was more quickly filled than formerly, but why the steam on coming into contact with cold water did not lose its quality was at first a mystery. HENRI GIFFARD was a Frenchman of marvellous inventiveness. In the course of thirty years he took out nearly forty patents to his own considerable profit, and he became a wealthy man. The greater part of his fortune was left to the French Government for the purpose of being employed on works of scientific utility. The Government in return decided to erect a memorial of GIFFARD in the headquarters of the French Society of Civil Engineers in the Rue Blanche, Paris. The commission was left incomplete by the late M. MASSOULLE, and was finished by M. COUTANT. The memorial is of white marble, and has been placed in the Salles des Fêtes of the Society. It consists of a bust of the inventor with allegorical figures. The Society of Civil Engineers in France promises to be as influential as the English Society. Wealthy members have been most generous, and, in consequence, the prizes which are offered give rise to spirited contests.

M. GÉRÔME not only has a long and distinguished history as a painter and sculptor, but he still is as brilliant in execution as he was in 1847. The *Cock-fighting*, which was painted in that year, is yet in the Luxembourg, and we hope it will long remain there. Since that time he has painted Greek, Roman, French and other incidents. He must be a daring man who would venture on the improvement of one of M. GÉRÔME'S pictures. But such an artist must exist, and he will soon have an opportunity of exhibiting himself in the law courts. In 1896 a picture was hung in the Salon in which M. GÉRÔME represented LOUIS XIV. and his Court in the gardens of Versailles. The king was shown near Madame DE MAINTENON. The painter was particular in suggesting that the incident occurred in the evening, when the expiring rays of the sun were visible, and the moon rose above the palace. This picture was lately found with MM. BERNHEIM, the dealers. It had been operated on by an American, who preferred to repaint the whole of the sky, and to omit not only the moon, but its delicate reflections on the basins. M. GÉRÔME was naturally annoyed, and proceedings have been taken by the artist in his own defence. MM. BERNHEIM admit that the picture appears to be altered, but from the successful manner of the execution they imagined the change was due to M. GÉRÔME himself. As is usual under such circumstances in France, this picture has been placed in the custody of an expert until the proceedings come to an end.

"AGRICULTURE."—BY H. S. MARKS, R.A.

THE WELLINGTON MONUMENT AT ST. PAUL'S.

A FOREIGNER who wished to exemplify the tendency towards confusion which is supposed to be inherent in England could not find a more striking instance than is afforded by the history of the Wellington Memorial. That noble work cannot be considered as completed, and as every stage of its existence has hitherto been marked by error, there is no knowing what may happen to it. There is a tragedy also accompanying it, for the life of the sculptor was clouded and, indeed, shortened by the unworthy treatment he received from representatives of the Government who were in power during its creation. A recent event suggests the propriety of a brief narration of the strange history.

WELLINGTON died in 1852, a year after the Great Exhibition in Hyde Park, which was imagined to initiate a new era in which war would be unknown. He was buried in the crypt of St. Paul's. In 1856 it was resolved to make arrangements for the erection of a monument in the cathedral. A competition that might be called international was organised. It excited so much interest that no less than five hundred applications were received for the conditions, which were accompanied by a plan of St. Paul's. The site selected was not that now occupied by STEVENS's work, or that in which it was originally set up, but under the most eastern arch on the north side of the nave, the space allotted measuring 13 feet by 9 feet. The cost of the memorial was estimated to be 20,000*l.*, an inadequate sum for so important an undertaking. The nine premiums offered amounted to 2,200*l.* Eighty-three designs were sent in.

Muddle prevailed as soon as the designs had to be considered. The judges were the Marquis of LANSLOWNE, Lord OVERSTONE, Dean MILMAN, Mr. EDWARD CUST, Mr. GLADSTONE and Professor COCKERELL. The last, as a professional artist, felt he was out of place, especially as his suggestions were not accepted. He therefore resigned. The business was consequently left in the hands of amateurs. One of their first steps was to express, but rather indefinitely, disapproval of the site. They said:—"We have not considered ourselves bound to take into exclusive consideration the peculiar fitness and adaptation to that spot in St. Paul's Cathedral which appears to be in contemplation for the erection of the proposed monument, which consideration might possibly have led to some difference in the selection." The judges assessed designs for the different prizes which varied in amount from 700*l.* to 100*l.*, but suggested that before one was chosen for execution the opinion of some experienced artists should be obtained. After the awards had been made the test was applied of placing the premiated models under a small copy in wood of the arch in the nave, although that position was thought to be unsuited. The design by ALFRED GEORGE STEVENS, to which one of the 100*l.* prizes had been adjudged, appeared to sustain the test most successfully, and Lord JOHN MANNERS, as First Commissioner of Works, gave him the commission.

The name of ALFRED STEVENS was mainly known in connection with industrial designs, and there was much discontent expressed over his appointment. This did not, so far as can be made out, produce any effect in

Whitehall. STEVENS was not, however, recognised as one of the grandes of art, and as if with a desire to diminish any pride he might feel at his success, the insufficient sum assigned for the work was further reduced. A pair of bas-reliefs were ordered to adorn the spot set apart for the memorial on the south-west instead of the north-east side of the building, and the 6,000*l.* which they cost, with other expenses, were deducted from the 20,000*l.* which was supposed to be applicable to STEVENS's work alone. STEVENS was allowed the liberty of altering his design to suit the diminished price, but the unprecedented condition was imposed on him that he must deposit with the Office of Works a full-sized model of the memorial as it was to be carried out. Eventually he found that not more than 10,000*l.* was at his disposal.

A work of such extreme importance, which was expected to embody the most advanced art of the time, and to express the national admiration for WELLINGTON, could not be modelled and wrought with expedition. STEVENS wished to brood over his task, and he altered and realtered, regardless of the fact that however much he might elaborate it and come nearer to perfection, there could be no increase of profit to himself. He was, unquestionably, a bad accountant, and, as such, was an undesirable contractor. The different parts of the memorial were not completed in the order which would be believed most satisfactory by ordinary men of business, and eventually it was necessary to make arrangements with another contractor for completing the work to such an extent as would enable the public to realise that the Office of Works was not wasting money on an illusion. The result is to be seen in St. Paul's. The materials used are bronze and marble. It is satisfactory to know that throughout it is an Englishman's design which is before us. It is also gratifying testimony to English skill that the complicated castings, than which none more difficult can be seen in Europe, were carried out in an English foundry by Mr. H. YOUNG.

In the original design, STEVENS intended to have the monument surmounted by an equestrian figure of WELLINGTON. He wished to suggest the victorious warrior who gained a hundred fights and never lost a gun, as well as the honoured chief who had to succumb like the meanest to death. STEVENS had studied Renaissance art too deeply to be unaware of the advantage of the pyramid arrangement. The equestrian figure formed a climax to the composition. That he was slow to realise so important a part of the memorial is easily understood. DA VINCI, we know, went long in quest of the central head for his *Last Supper*. Dean MILMAN had objected in a humorous way to the Duke riding into the cathedral on his own monument, and in consequence STEVENS had prepared a dome-like termination. Any modification of that kind, which, by-the-by, was never realised, did not cause the annihilation of his project of a conquering WELLINGTON. His pupil, Mr. HUGH STANNUS, tells us how STEVENS, "after his affliction by paralysis, and when his mind had become somewhat warped, began to prepare a model for an equestrian statue. This is very rough and incomplete, being a mere full-sized sketch in plaster."

Everyone knows that for the last quarter of a century much has been said and written concerning the statue. It

is a question which bristles with difficulties. STEVENS's rough sketch is less suggestive of the slim "Copenhagen" which was employed at Waterloo than of such a horse as Mr. G. F. WATTS has modelled, and which can portray the dominant power of the rider. Mr. STANNUS put one side of the case when he said:—"A first-rate sculptor accustomed to equestrian groups would doubtless find it (the model) very useful to fix the size and general attitude in making a group, should the Government decide upon going to the expense, and if the cathedral authorities revoke the late Dean's decision and allow of it. This would, however, at once take away from STEVENS the credit of having completed the work. The truest respect to his memory will be

ORIGINAL DESIGN FOR WELLINGTON MEMORIAL.

shown by leaving the monument as he arranged it at the climax of his judgment, instead of calling in another sculptor to divide the credit with the dead." On the other hand, we have the late Lord LEIGHTON advocating the worthily crowning of the magnificent conception of the memorial by an equestrian statue of the Duke. The rough unfinished model, he considered, would "serve as a sufficient guide to the artist who shall be privileged finally to carry out this portion of the cenotaph; that artist should be a man whose genius will carry him worthily through such a task, and whose reverence for the name of ALFRED STEVENS will insure that close adherence to the leading lines and features of the first design which the public voice would justly demand; such a man, both in his gifts and in his reverence, the Dean and Chapter of St. Paul's have seen in Mr. GILBERT, R.A., whose selection for so noble a task will command, I cannot doubt, universal approval."

Lord LEIGHTON endeavoured to collect the funds which would be requisite for the production of the statue. Sir E. J. POYNTER vainly attempted to induce the Government to give 2,000/. Last year the President considered he was justified in believing the Government would be more favourable to the proposal. Meanwhile another effort was being made by a few private donors to raise the money, and with better results. The Dean and Chapter have agreed to the project, and the commission

for the equestrian figure has been entrusted to Mr. JOHN TWEED.

In our days it is almost impossible to make a selection of an artist which will gain general approval. There is so much equality among painters and sculptors, it is assumed that the preference for any individual is a slight on the others, as if it were intended to convey that there is no longer a common average among all. It was inevitable that when a sculptor who was not even an Associate of the Academy was selected for so important an undertaking his capability should be questioned. Mr. TWEED can point to, at least, one trial-piece which is meritorious. We published some panels in June 1900 which were prepared by him for the base of a statue of CECIL RHODES, and anyone who will look at them with impartial eyes must allow that the mounted men and their steeds have been modelled with much vigour. The sculptor made no attempt to imitate, much less to rival, the Panathenaic frieze. He had to represent improvised soldiers without any common uniform, and their horses were not of the heroic type. The figure of CECIL RHODES is also without any idealisation. It is the portrait of a vigorous man who wished to be represented in his everyday attire, which it must be allowed is not suggestive of Bond Street. What must strike everyone is that the sculptor was above all things truthful, and faithfully realised the class of men who were the pioneers of empire in South Africa.

Is it to be taken as a universal axiom that a young sculptor who makes individuality predominant in his works must necessarily fail when he attempts to be imaginative? To say, as one of the Academicians does, that to put TWEED upon STEVENS is to put Salisbury spire upon St. Paul's, and that the result would be lamentable because the incongruity would be lasting, and remain an eternal discredit to the art judgment of this generation may be very vehement; but it is only a new version of the attacks made against STEVENS nearly fifty years ago, when the superior beings of art pointed out the incongruity of employing the work of a modeller of fenders and fireirons for a national memorial. Why should Mr. TWEED be denied the opportunity of producing an heroic figure of WELLINGTON because he has been successful in representing miners on horseback and undrilled infantry? A man who is a devoted admirer of STEVENS's work is not likely to be regardless of the spirit of the memorial.

At the same time, we consider that as the memorial is a national treasure it should not be made the subject of hole-and-corner arrangements. A few men may believe they are entitled to public gratitude because they subscribed among themselves the 2,000/ for the completion of the Wellington Monument, which Lord LEIGHTON with all his influence was unable to raise, and which the Government were afraid to grant. But they would show a more wise and generous spirit if they did not insist on being the dispensers of the money. Many a fine church in England has been ruined because subscribers insisted on the carrying out of pet schemes of restoration. Sculpture can be as easily disfigured as buildings. We do not suppose Mr. TWEED's work would be out of harmony with STEVENS's. As he obtained the commission let him retain it. But for the sake of principle we consider he ought to allow his model of the equestrian statue of WELLINGTON to be subjected to the scrutiny of some artists of standing. If there is any apprehension of jealousy affecting impartiality in England it would not be impossible to obtain a judgment from Frenchmen which could not be impugned. But what artist would equal Mr. WATTS for such a purpose?

We cannot close without remarking on the conduct of the Dean and Chapter of St. Paul's. For years past it was believed that Dean MILMAN's dictum about the unfitness of an equestrian figure was still accepted as law. Now there has been a startling change, and arrangements have been entered into which are enough to disturb the repose of the author of "Fazio." The Bishop of Stepney, although chairman of the committee, was not aware of what was transacted between his own committee and the Dean and Chapter. The President of the Royal Academy was no less ignorant on the subject. All this is very serious. It reveals that the cathedral authorities need supervision, and that to insure protection for the building and its contents Parliamentary interference is urgently demanded.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER IV.

PERSPECTIVE EFFECTS, CHIAROSCURO, PROJECTIONS.

THE problem of dealing with *perspective effects* is one of varying importance, dependent, of course, not merely on the nature of the building, but, to a still greater extent, on the possibilities existing, or to be created, for obtaining perspective views. And it must be remembered that very little, if any, consideration need be accorded on this score to a *mere* façade, as possessed by many even important buildings in large towns. But when the facility exists for viewing the building *en bloc*, and from various standpoints, the value of perspective effects is in direct ratio to the *importance* of the structure, if it be a public one, and to its *nature*, if private.

It has just been noted that the *mere* façade needs but slight consideration perspectively, and this because it would require extraordinary efforts in such cases to produce unsatisfactory effects. As soon, however, as the roof-line with any excrescent features is in question, perspective merits close consideration. This will be more clearly shown by a couple of examples. One is illustrated here (fig. 21), being a perspective view of the warehouse previously shown in elevation. It will be noted that the effect of its being viewed from one imaginary standpoint (as is the case in geometrical elevations) is on a par with the proper perspective effect. But let anyone take the trouble to view the openwork finial to the Hippodrome in Leicester Square, London; it looks amorphous or, at any rate, misshapen. The effect from the street is displeasing in the extreme, though it is possible that the finial looked passable in geometrical elevation.

It is frequently remarked how this or that building looks so well (or otherwise) from such and such a view; as for example, St. Paul's Cathedral is said to be seen to greatest advantage from Fetter Lane. The writer's opinion is that Watling Street, by Bow Lane, offers one of the happiest views. This leads inevitably to the conclusion that architects should not merely consider the effect of their building from one particular standpoint, but should also take into account the possible positions for obtaining

Warehouse: G.P. Bankhart, Architect.
FIG. 21.

views; the latter requirement is twofold in its nature, not only expansive, but limitative—that is to say, that whilst the

knowledge that, in one instance; there are numerous points for observation will necessitate the consideration of perspective effects on an extended basis, a very limited scope for observance in another instance would render the consideration of such effects unnecessary.

To meet a possible contention that might be urged here—namely, that it evinces a poor artist who would treat thus grudgingly the question of perspective effects—it must be remarked that it is dealt with so as to show possible or permissible modifications of design, and it is by no means recommended that such harsh treatment should be accorded as would be implied by an abrupt dividing line. But after making all allowances, the following maxim will hold good, namely, that a design suitable where there exists an unobstructed view would admit of proportional modified treatment according as the view is more or less impeded. Consider, for example, an elevation such as is shown in fig. 22. This might be suitable for one of the

FIG. 22.—SIDE ELEVATION TO HOUSE.

sides of a detached house, with adequate means of viewing same. If, however, another building is brought so close up to it as to conceal the elevation from view, the aesthetic value of the design is destroyed; windows and arches which help to break the surface of a wall so pleasingly, and aid powerfully in perspective effects, lose their value in this respect when the two buildings are so close together as to render it impossible to focus the side elevation. Again, a raking plinth, as shown, which serves to add to the appearance of strength, loses value under like conditions; a heavy projecting cornice that gives effective play to chiaroscuro has a minimum value when the sunshine or daylight does not gain access. An example of such neighbouring blocks of buildings can be seen on Holborn Viaduct, London, and a glance at these would serve to show the uselessness of designing attractive elevations for their flanks. Of course, as previously remarked in reference to scale, if the obstruction is clearly but a temporary one, or of a nature likely to be removed speedily, and not to be replaced by another, then the treatment accorded should be as though an obstruction did not exist. Individual features should likewise be similarly considered, so frequently is a geometrical design stultified when subjected to the practical application of the laws of perspective. A dome requires the utmost care in design. St. Paul's Cathedral is a well-known instance of successful application; and the dome, holding as it does a somewhat central position on the building, and dominating the neighbourhood, is the noblest conceivable treatment under the circumstances. Objection is at times taken to the so-called falsity of the design, in that this dome is not constructional, but the objection is not one that should be seriously urged. WREN well knew the principles that should govern the employment of this feature. A paraboloid would not have been so happy a form externally as the nearly hemispherical section employed; whilst viewed internally the latter form might, through an optical illusion, have seemed to "sag" (bend inwards) at the crown; but, by using the paraboloid for the internal dome, the optical effect would be satisfactory. It is, as a

rule, a mistake to impute to people particular currents of thought when viewing their completed works; but, in the case of WREN, who has left so many successful monuments behind him, there is ample warrant. That St. Paul's has defects, regarded æsthetically, is pretty generally allowed, the most serious being the screen wall in front of the flying buttresses, but when any man can claim with justice to have surpassed WREN as an architect, it will be time for such an individual to cavil at the master's work. However, it would be then found that the desire to indulge in invectives would have passed away. The cathedral has been too often reproduced to warrant its inclusion here, but the construction to which objection has been taken is illustrated later. In passing, it may be noted that neither of the two domes referred to above is (strictly speaking) structural, an intermediate brick hyperboloidal cone doing the useful work, the two domes being more purely decorative.

Pavilion roofs, rectangular on plan, and of curved section, are frequently used on buildings, and, as customarily treated, have a very "lean and hungry look." It is most assuredly requisite that their effect should be tried in perspective from the principal possible standpoints. The finial or lantern, which forms the termination very frequently, requires careful contouring. It may possibly be considered a matter of individual taste; but to the author the finial treatment accorded to the dome on that otherwise fine building, the Carlton Hotel, London, is unworthy of its position. This is only one example of unpleasant effect that might be copiously illustrated. Flèches on roofs are also apt to look clumsy in treatment: it would be well in both cases to erect trial models on the buildings.

Intimately connected with perspective effects is the subject of the correction of optical illusions, and in this there are no better models to be followed than the ancient Greeks. They raised the subject to the level of high art. Entasis (the curvature given to shafts of columns) was introduced to correct the hollowed appearance (greatest near the centre) that a long, unbroken, straight-standing line would assume. The *scamilli impares* was similar treatment accorded to the steps of a flight, to prevent the appearance of "sagging" (or sinking) that would otherwise be noticeable.

Entasis is frequently—indeed, customarily—employed at the present day, but the use of *scamilli impares* is neglected. Many architects are, unfortunately, not satisfied with confining the use of entasis for a negative result, but employ it for the purpose of pulvination or cushioning, a fashion that is greatly to be deprecated. An example of this is shown in fig. 23. The mistake so often made is to follow blindly

Pulvination

FIG. 23.

any matter, instead of understanding the *raison d'être*. The Greeks, for example, did not commence the entasis from the base of the shaft, as they recognised it up to about the average level of the eye the straightness of a line was not affected optically; consequently the shaft was made straight for the corresponding lower portion of the total height, and thence to the top a very gentle entasis was employed. The result of the scientific care exercised was an apparently straight shaft, but in the present day the entasis is too often carbuncular. In a similar way to what is required by columns as regards entasis, so also is it with spires. Another feature in the employment of which the Greeks increased their æsthetic feeling was the diminishing shaft.

They were either guided by Nature, who even in the shape and diminution of the trunk of a tree (possibly the origin of the Greek column) works æsthetically; haply their artistic instincts sufficed, or they may have been influenced by both in combination. It may be urged that nature has a scientific explanation for such diminution, and that art and nature do not necessarily work in parallel grooves; but the probability is that the Greeks, convinced that there was not any scientific principle involved that would condemn the use of the diminishing shaft, felt themselves to be at liberty to indulge their artistic proclivities.

Other devices were also resorted to by them to improve the effect of their buildings, and all show evidence of earnest thought. They gave apparently additional strength to the angles of their stylobades by lessening the extreme intercolumniations, and in their Doric order, this produced the additional advantage of bringing the end triglyphs close to the angles of the frieze, thus further giving the appearance of additional strength. In Appendix B, some remarks by the Roman architect, VITRUVIUS, are extracted from his work on Architecture. These extracts will show incidentally that certain of the principles advocated in the present series, and written in the twentieth century of the Christian era, are amply supported by the precedent established in VITRUVIUS's writings of the first century.

(To be continued.)

ARCHITECTURAL COMPOSITION.*

WHEN ADDISON first presented himself as "Mr. SPECTATOR," he narrated his history in the belief that a reader rarely is pleased with a book until he knows something about the character of the author, his appearance and disposition. In those days books were not so abundant as they are now, and there were fewer writers. People do not trouble themselves about their favourite authors nowadays, or if they give them a thought they have confidence in their own ability to realise all idiosyncrasies without further aid than is afforded by the printed pages. In the case of Mr. VAN PELT they would be likely to say he was a vivacious gentleman who was fond of informal teaching, who would express his thoughts as readily by a little diagram on the margin of a student's drawing as by words, and who would enforce his conclusions by referring to the practice of French architects in whose offices he worked, or the lectures he attended at the Ecole des Beaux-Arts. In the "Apologia pro Vita Sua" Cardinal NEWMAN tells us how he was taught by WHATELY to weigh his words, and to be cautious in his statements; how Dr. HAWKINS enlightened him about Tradition; how some other Don of Oriel expounded to him the doctrine of Apostolical Succession, and so on. Mr. VAN PELT in the same way states that one part of his volume is due to the teachings of M. GUADET, that M. THIERRY made him realise the significance of a plan, and M. DEGLANE the meaning of the word "composition." We suppose many a young Sunday-school teacher must have been amazed at the backwardness of JOHN HENRY NEWMAN although he was a Fellow of Oriel, and no doubt there are students who will take airs when they contrast Mr. VAN PELT's dulness with their own instinctive appreciation of planning and designing. Both cases suggest what different significations can be attached to simple words. Does every architect who is in practice comprehend the significance of a plan, or the meaning of "composition," with all the fulness which the words convey to the mind of a French professor of architecture? We do not think so, and we believe that a man has reason to be grateful to anyone who would demonstrate to him, even partially, how vast is the knowledge and skill which plan or composition can involve.

This demonstration is rarely to be performed by means of a book alone. We can imagine that Mr. VAN PELT's pupils in the Cornell College will say that in his volume

* A Discussion of Composition Especially as Applied to Architecture, by John Vredenburg Van Pelt, Architecte diplômé par le Gouvernement Français, Professor in Charge of the College of Architecture, Cornell University. Illustrated by the author. London: Macmillan & Co., Ltd.

there is not the animation which was to be found in his lectures and conversation. All students do not encounter the same difficulties, and the way to expound plans or to give an initiation into the mysteries of composition must be adapted to the peculiarities of an individual student. In other words, we believe that the "Discussion," which does not in this case mean debating, is little more than an outline of the college discourses. It is divided into six parts, some of which relate as much to painting and sculpture and other modes of production as to architecture. In the first we hear of artistic virtues such as truth, simplicity, carefulness, &c.; in the second the elementary principles of composition and technical laws are explained; in the third we learn about the application of the laws of composition; in the fourth various suggestions are made about decorative works; the fifth and sixth relate to planning under various forms.

Mr. VAN PELT supports his conclusions by extracts from various writers, RUSKIN, and more especially M. MAYEUX, being considered as serviceable. Many diagrams are introduced, and the careful reader will derive from the book such a knowledge of French practice as will be useful to him professionally. For example, the following laws of composition express qualities which in French work are generally present:—

1. The interest must be focalised, and have its most potent expression in one point. (This point we shall call the climax.)
2. The number of secondary focal points must be reduced to minimum; where such points exist they must be conceived primarily in regard to the climax, and in their comparative importance must work up to it.
3. The different minor elements of the composition, each perhaps relating to its own special focal point, must still feel the influence of the climax.
4. In a pictorial composition the different elements must balance in such a manner that the average of interest will fall in the middle of the frame. In the other visual arts balance in relation to the centre of gravity must be observed.
5. That the different elements of a composition, climax, secondary climaxes and sub-motives may attain to the highest interest they must contrast one with the other.
6. That unity exist in the composition the laws of harmony must be observed and no foreign element introduced.

The foregoing conclusions or axioms are of course explained and developed. It is difficult to base art on science, but Mr. VAN PELT does so as far as possible. There is, for example, an interesting chapter on optical effects which will suggest reasons for perceptions which are indisputably incorrect. Thus, the angle at the apex of an equilateral triangle, which must be equiangular, with a horizontal base, seems more acute than the angles at the base. Parallel lines, as everybody is aware, appear to converge; it is also a simple matter to make right lines on planes look to be curved, and hence "it is possible some of the curves apparently used by the Greeks in place of straight lines in their larger temples—the Parthenon, for instance—presumably intended to correct unpleasant optical effects, were, in essence, the outcome of the illusion just described." But even sceptics are disposed to make an exception of the Parthenon although they may allow the rule applies to other edifices.

When treating of plans, some examples which won the Grand Prix of the Ecole des Beaux-Arts are introduced. M. DEGLANE, who has been successful in that way, recognises the difference between ideal work and efforts to meet specific conditions. One of his maxims, we are told, is "The architect can never have perfection. He must always choose the lesser of two evils." That is peculiarly applicable in the case of planning. Modern needs are not served by plans in the Louis XV. style, but wealthy Americans are willing to put up with some inconvenience in order to have a château. Mr. VAN PELT explains one exercise in planning on a grand scale, in which his students at Cornell took part. The subject was "a riding club," with stables for 160 horses, an arena for riding lessons and exhibitions, a carriage house and servants' quarters. Each of the items was taken up separately and considered, and after going through the work in detail and making several attempts, returning, it may be, to the first thought as the most eligible, the final work required is thus suggested:—"Further study of the sketch means a careful redrawing of the whole, or, at least, of parts, on

successive pieces of tracing paper—five, ten, twenty times, if need be. We begin with masses, and end by going into the smallest details, first at a small scale, then at double. Finally come the exhibition or working drawings." An exercise of that kind must have a beneficial effect upon young architects, although they will afterwards discover that commissions have to be executed in a more summary way. The teaching must also induce American students to look to France as the only country in which the art of architecture is systematised. Mr. VAN PELT gives general directions about the manner in which the planning of different classes of buildings should be taken up. The following extract relating to churches will show the spirit in which the most important part of the discussion is treated:—

There are two extremes toward which such buildings tend, the mystical and the scientific. Of the former the Roman Catholic Church is a type; of the latter the ethical culture cults. The more worship tends to the mystical the more do forms, pageants, processions, impressive ceremonies, music and all that appeals to the senses, and through them to the imagination, become important; as the cult tends to the scientific the more are these, or any suggestion of aught greater than force and matter, excluded. Character must foreshadow these tendencies. The range is from the cathedral of Chartres or Notre-Dame de Paris to the ethical lecture-hall. None of our Protestant forms of worship have the fulness of the old Roman Catholic service. In all modern services there is need of an auditorium. The Episcopal service is the most ornate of these. While it is the direct descendant of the English and earlier Roman Catholic service, it usually shows no need for processions. In the planning of its churches it does away with the requisite of side aisles, and even chapels, substituting that the greatest number of worshippers must hear and follow the priest, both in sermon and service. It is true that the Church of England holds its services in old cathedrals, but this is in spite of their want of adaptation evidenced by the greater part of the English churches being closed off by choir screens, &c. The practical requirements are changed in the most conservative of our forms of modern worship. Is the spirit changed also? Certainly, some divisions of the Church of England are not far removed from the old feeling at Rome, but the great body is essentially modern. In our churches is a mistake to copy old cathedrals in plan—present needs are changed; a fault to imitate them in feeling—modern spirit has forgotten the old.

The volume cannot fail to be useful to students. It is not, however, to be treated as an auxiliary by those who are indisposed to think seriously about the problems which their art presents. Greater profit will be derived from the pages by all who will not regard it as a collection of ready-made formulæ, but rather as a guide to thinking. By means of it energetic students can create an Ecole des Beaux-Arts of their own, which will no doubt be infinitely below the great institution in the Rue Bonaparte, but which will at least be superior to the jog-trot routine which has to be gone through by a great many architectural aspirants in this country.

HILL OF TARA, CO. MEATH.

THE report of the Royal Society of Antiquaries of Ireland says in reference to the excavations at the Hill of Tara: "The irreparable injury done by the partial destruction of the 'Rath of the Synods,' continued during a portion of the present year, has occupied the serious attention of the Council and everything considered practicable was done to stop the work of destruction."

The alleged object in digging up this mound is stated to be a search for "The Ark of the Covenant," which the instigator of the search has stated he believes to have been deposited in this particular rath.

The search, as prosecuted by him, involved the digging up and consequent destruction of the contour of the portion of the mound examined, and it is to the credit of Irish archaeologists that they have not allowed themselves to be identified with the act of vandalism.

The search having proved fruitless, and a strong feeling of indignation having been gradually aroused in the locality elsewhere against the continuance of the work, and for other reasons, it was abandoned during the week ending June 28th. On the 18th of that month, the Navan Rural District Council, in whose district the monument is situated, adopted a strong worded resolution against "the action of the parties engaged in obliterating the ancient and historic landmarks—the far-famed Hill of Tara in the idiotic search for the mythical Ark of the Covenant."

The Council have received from the watching committee, appointed to advise in connection with the preservation of these mounds, a report as follows:—

"The committee find that the famed earthworks on the Hill of Tara have for long engaged the attention of the Society. They formed the principal attraction of the summer excursion in June 1894, for which occasion a short account of the antiquities and their history was published, with a copy of the Ordnance Survey map of the hill, and a map which was adapted from that of Dr. Petrie, as given in his 'Essay on the History and Antiquities of Tara.'

"The earthworks of Tara are enumerated in the schedule attached to the Ancient Monuments Protection Act, 1882 (45 & 46 Vict. cap. 73). Under the provisions of this Act the owner might by deed, under his hand, constitute the Commissioners of Public Works, Ireland, the guardians thereof. It appears that, in the case of Tara, no such deed as was contemplated by the Act was executed by the owners.

"The portion of the hill on which the greater number of the mounds are situated, and the more important part, is on the property of Earl Russell; the remaining portion is on the property of Mr. G. V. Briscoe.

"In the summer of 1899 attention was called in Parliament to the fact that deep trenches were being dug through the Rath of the Synods, which is on the property of Mr. Briscoe. The Board of Works took steps to stop the injury to this mound, but finding that it was not vested in them, withdrew from any further interference with the owner.

"On Lord Russell's portion of the hill, where the more important of the existing structures are to be found, there has been no visible alteration in their contour since Petrie's time. The Council wrote to Lord Russell representing the importance of preserving the present condition of the hill, and requested his lordship 'not to allow any excavations to be made on his property at Tara unless under competent archaeological advice, and that if his lordship wishes to allow excavations to be made, the Society would be prepared to arrange for such assistance, in the way of advice and supervision, as may be necessary.' To this communication a reply was received from the agent of the property, as follows:—'My instructions from Lord Russell are that he will allow no excavations to be made on his property at Tara. I have so notified Mr. Briscoe.

"Mr. Patrick Boylan, of Dublin, it appeared, had acquired the interest of a long lease of lands, of which Mr. Briscoe was the owner in fee. The Council at once put themselves in communication with him. Mr. Boylan being a resident in Dublin, the president, secretary and Mr. B. R. T. Balfour, of Townley Hall, had the advantage of several personal interviews with him, with the result that on June 15 he intimated that he withdrew his permission to Mr. Briscoe, and on July 1 last Mr. Boylan wrote as follows:—'I had an interview with Mr. Briscoe, and he gave me to understand that he would do anything I require in reference to Tara Hill. The men have ceased working at the Hill, and Mr. Groom has gone back to England.'

"Mr. Boylan's premature decease within the last few weeks has, perhaps, created some uncertainty as to the ultimate disposal of this portion of Tara, but for the moment nothing can be done.

"The condition in which the Rath of the Synods has been left is deplorable. It has been trenched over almost entirely to a depth of from 8 to 10 feet, and in some places to a greater depth. With such digging up and destruction of the contour no archaeological body could for a moment identify themselves; nor could your Society consent to take any part with the instigators of this search for the 'Ark of the Covenant.'

"Any well-devised scheme for the scientific investigation of the antiquities of Tara would require not only money, but experience on the part of the investigators, and would require the co-operation of Earl Russell and the representatives of the estate Mr. Boylan."

LIVERPOOL BUILDING BY-LAWS.

A MEETING of the Liverpool Architectural Society was held on Monday. Mr. W. E. Willink presided, and Mr. William Goldstraw, city building surveyor, read a paper on the revised building by-laws of the Corporation. The by-laws a question were provided in the Liverpool Corporation Act, 1902, which gave amended powers as to streets and buildings. One of the most important gave the Corporation the power to increase the width of new streets. Where the Corporation considered any new street to be a main thoroughfare or a main approach to the city they were now empowered to make a maximum width of 80 feet between buildings, instead of 5 feet. The object of this was to obviate the danger of having to pay heavy compensation in years to come. It was obvious that if they allowed the streets to be made 36 feet between buildings, and the necessity subsequently arose to

widen the thoroughfare and set back the buildings, very large amounts would have to be paid for compensation. In cases where a width of 80 feet was insisted upon the Act gave the Corporation power to pay any reasonable compensation. It was also stipulated that no new houses were to be built on new estates before the street had been laid out with a proper foundation and had been sewered, curbed and channelled, besides which the Corporation might require persons laying out estates to alter the proposed direction or position of any street and pay compensation. The Corporation were further empowered to require that the corner of a new building situated at the corner of two streets be rounded off or splayed off to the height of the first storey or more, in which case they might pay compensation. Where compensation was to be paid, if it was found that the improvement would be for the benefit of the owner of the building as well as the public, the arbitrator could take account of that and apply the principle of betterment. Another important provision related to the height of chimneys of manufactories and other similar buildings. Formerly the only question as to the construction of these chimneys was that of stability. A chimney might be of sufficient stability and yet be a nuisance to neighbouring buildings. Where the owner of such chimney was summoned and fined for a nuisance and ordered to have the chimney raised it might frequently happen that the existing chimney was not strong enough to allow of its being raised, and in order to avoid this the revised by-laws provided that such chimneys must in future be of such a height as the Corporation may require, having regard to the neighbouring buildings. Hitherto blocks of working-men's dwellings had had to be designed in accordance with the rule for ordinary dwellings, but the Corporation could now relax or modify the building regulations on condition that the medical officer of health, the city engineer and the city building surveyor certify that sufficient provision is made for air space and ventilation. The first building to be dealt with under this new provision was the Working Men's Home, Bevington Bush, where a very large addition was now being made to the premises. A section of the new Act also dealt with the nuisance caused by posts placed in or near the kerbstone to support awnings which stretched across the footway. These were particularly noticeable in front of places of business in Church Street and Queen's Square. There was a statutory power allowing owners to put the awnings in that fashion, but that power had been repealed, so that in future the nuisance in question could not happen. Another street nuisance would be done away with by the occupiers of shops and offices being made liable to place all the refuse from their respective places of business in dust-boxes provided by the Corporation. Referring to the new powers as to drainage by-laws Mr. Goldstraw said in the past where an owner, contractor and sub-contractor were concerned, it had been difficult to discover who was personally responsible for bad workmanship in the construction of drains; but in future if a w.c. or a drain was so constructed as to be a nuisance or injurious to health, the person who had so constructed it was liable to a penalty not exceeding 20% unless he could prove that it was not due to any wilful neglect or default. The section also carried the principle further by making the workman liable. On the whole the revised by-laws were, Mr. Goldstraw maintained, drafted for the benefit and health of the city, and he trusted that good results would justify them.

Mr. J. Woolfall thought the question of the 80 feet street required very serious consideration. He cordially approved of the regulation as to the construction of drains.

Mr. Middleton Shallcross said it was a matter for congratulation that municipal surveyors throughout the country seemed in practical accord as to the necessity for the reform of the Public Health Acts affecting building by-laws, and that Mr. Goldstraw had set so excellent a precedent. If discussions took place between the officials of each sanitary authority throughout the United Kingdom and the architects affected by their respective jurisdictions, the result of their joint deliberations would probably be that substantial improvement in building, not excluding economies therein, would be effected. Mr. Shallcross was proceeding to point out the necessity for various reforms in building by-laws generally, when at the suggestion of the chairman he agreed to reserve his comments for another meeting.

Mr. Grayson, in proposing a vote of thanks to Mr. Goldstraw, said it was advisable that great discretionary power should be given to officials like the building surveyor of Liverpool. Mr. Eccles seconded.

The Chairman said that it was only advisable to give discretionary power where the officials could be implicitly relied upon. Fortunately this was the case in Liverpool, and no one would be allowed to succeed Mr. Goldstraw and the other officials except those who could be relied upon to exercise a fair discretion and justice.

The resolution was carried with acclamation, and Mr. Goldstraw responded.

NOTES AND COMMENTS.

THE announcement of the purchase of the Prince's Tavern, Albert Square and Cross Street, Manchester, by the Scottish Amicable Life Assurance Society of Glasgow has revived an interest in the legend that it was the birth-place of THOMAS DE QUINCEY, the author of the "Confessions of an English Opium-Eater" and many valuable essays. He tells us in his Autobiography that he was born in a large town, the town of Manchester, even then among the largest in the island. In the register of baptisms at St. Anne's Church there is a record dated September 23, 1785, of THOMAS, son of ELIZABETH QUINCEY. But there is no certain evidence as to the particular street where the infant was born. He says he passed the whole of his childhood, except the very earliest weeks, in a rural seclusion, viz., in a cottage called "The Farm." After 1791 the family lived in Greenhay, a villa which his father had built about a mile out of Manchester, in a little hamlet known as Greenhill. The district is now absorbed in Manchester, and is familiar as Greenhays. DE QUINCEY's father died in 1793, and four years afterwards his mother considered the keeping-up of Greenhay was too expensive and removed to Bath, and in his twelfth year the boy entered the local Grammar school. When he was sixteen, and after some adventures, he was placed in the Manchester Grammar school, not to increase his classical knowledge, which was remarkable, but to obtain one of the exhibitions. He ran away from the school in July 1802, and then his connection with Manchester came to an end. DE QUINCEY was very exact about the history of his childhood, for at that period he believed his visions began, and he was therefore a prepared subject for the operations of opium on his brain. As he does not mention the street in which he was born we may conclude he was ignorant about it, and the efforts at its identification have not resulted in certainty.

THERE have been more important men in the world than MICHEL MONTAIGNE, but there never was a member of the human race who is so well known. He had no BOSWELL to record his conversations, but he did not hesitate with his own hand to lay bare his thoughts and opinions as well as his weaknesses. He described his surroundings, and especially the house in which he lived. Imagination has often pictured it, but very few travellers have inspected the out-of-the-way place at Périgord where it stood. All of it, with the exception of the library tower, was destroyed by fire in January 1885. At the time we published a description of a visit to the building in 1836 by JOHN STIRLING, who was one of CARLYLE's most intimate friends, if not his disciple. After the fire it was reconstructed by M. THERON-MONTAUBAN, who had married the daughter of M. MAGNE, the French Minister of Finance. STIRLING found the library to correspond with MONTAIGNE's own description:—"The form of my study is round, and has no more straight than what is taken up by my table and chair, so that the curve presents me with a view of all my books, in five rows of shelves, quite round me. It has three noble and free prospects, and is sixteen paces in the diameter." STIRLING says:—"The room still overlooks the entrance of the château, and from three windows in different sides of the circuit commands the garden, the court, the house and the outhouses. The books, indeed, are gone, but the many small rafters of the roof are inscribed on their lower faces with mottoes and pithy sentences, which recall, as by a living voice, the favourite studies and thoughts of MONTAIGNE." The château is now the property of M. DE REVERSEAUX, the French ambassador at Vienna. It has had a succession of owners and was subjected to many changes. It is remarkable that the only part of the ancient mansion which has survived the vicissitudes of years is the library, which was more closely identified than any other portion with the immortal author of the essays.

In all large cities the permanence of bench-marks becomes important. If they can be accepted as remaining at the same level, the operation of levelling is facilitated. For that reason a list of bench-marks with their reduced levels should always be found in the offices of a municipal

engineer. A list of bench-marks connected with the Ordnance Survey is obtainable, and has been found useful. In a great many cases it is almost impossible in the course of a few years for a bench-mark to remain at its original level. If it is on the street pavement the flags may be raised or lowered, and those on private premises are also liable to modification. In some cities arrangements have been made for providing bench-marks which can be described as permanent. Chicago is one of them. A block of granite concrete of a depth of 6 feet 6 inches is fixed in the ground; it is 3 feet 6 inches square and 1 foot 4 inches at the top, which is 6 inches below the surface of the ground. A ring or disc of hardened copper on the top indicates the bench-mark. There is an iron cover with a lid that can be moved when occasion requires. The bench-marks are placed about a mile apart, and already they have been established over one-half the area of the city. They are public monuments, and therefore it is an offence to meddle with them. In connection with them about 1,000 bench-marks have been established on doorsteps, pavements and other eligible places. The arrangement will be most convenient for the engineering staff, and will aid in the production of more accurate sections.

THERE seems to be some fatality, or rather series of fatalities, about the memorial to CHARLES GARNIER, the architect of the Paris Opera House. It is not a colossal undertaking, for the site assigned to it is beside one of the walls of the great building in the Rue Scribe. As the scaffolding which was set up to erect the framing of the bust had been removed, it was assumed that a day could shortly be fixed for the inauguration. The bust was to be a copy in bronze from a model by CARPEAUX, but it has not been completed. As the works of the underground railway are about to be commenced close to the building the inauguration has been postponed indefinitely.

AN election was held at the Royal Academy on Wednesday evening, when, as was anticipated, Sir E. WATERLOW, president of the Society of Painters in Water Colours, was elected an Academician. The new Associates are Mr. T. ARNESBY BROWN, who is known by his "landscapes with cattle"; Mr. J. H. F. BACON, whose painting of the reception of the City Imperial Volunteers was considered to be unusually successful; and Mr. W. COLTON, the sculptor of *The Girdle*, which was purchased out of the Chantrey Fund.

ILLUSTRATIONS.

WOODWORK: ALL HALLOWS CHURCH, LOMBARD STREET, E.

THIS illustration shows the altar-piece, pulpit, railing &c., forming the woodwork which is referred to in the resolution of the Society of Antiquaries against the demolition of All Hallows Church. Although the church is one of WREN's, it was not constructed until twenty-eight years after the Great Fire of 1666. At the time there must have been several wood carvers in London who may have felt some influence of GRINLING GIBBONS. That great carver lived until 1721, dying at his house in Bow Street, Covent Garden, but we doubt whether he was engaged on All Hallows Church. The altar-piece, with its seven canopies, was deemed to be a great success, but we can believe so simple an arrangement could have been imagined by GIBBONS. It was a special gift, costing £1867, and the vestry is a record of the names of the subscribers. The door cases are also carved, and it was characteristic of the time to introduce the semblance of a curtain in wood to conceal additional ornament. There are figures of Time and Death, and the font, which is of marble, has cherubs and floral wreaths. The parish is an old one, the Dean and Chapter of Canterbury being the patrons. There has been a connection with the arch-diocese since the eleventh century.

TOWN HALL, COLCHESTER: TOP LANDING, LOOKING TO MARTYR'S MEMORIAL.

CATHEDRAL SERIES: WORCESTER—CLOISTERS AND TOWER.

WAKEFIELD COUNTY BUILDINGS: THE COUNCIL CHAMBER.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., president, in the chair.

The Hon. Secretary announced the decease of the following members:—Mr. William Wimple, fellow, elected 1888; Mr. J. F. Wadmore, associate, elected 1865; and Mr. Albert Charles Briggs, associate, elected 1892. He also announced gifts of books to the library and the fourteenth donation of 5*l.* from Mr. Sydney Smirke to the library fund.

Award of Prizes and Studentships, 1902-3.

The Institute Silver Medal and 25 Guineas (essays).—The subject, "A comparative review of the various past and present systems of architectural training at home and abroad," attracted three competitors. The medal was not awarded, but a certificate of hon. mention was granted to Mr. A. Troyte Griffith, of Malvern.

The Institute Silver Medal and 10 Guineas (drawings).—Measured drawings of ancient buildings in the United Kingdom or abroad were the subject of the competition. The medal was awarded to Mr. A. Rollo, of Glasgow, who submitted five strainers of Craigievar Castle, Aberdeen.

*The Soane Medallion and 10*l.* (for continental travel).*—There were twenty-one competitors. The subject was "Design for a town church." Mr. E. F. Reynolds, of Birchfield, was successful with six strainers. A medal of merit was awarded to Mr. F. C. Mears, of South Kensington, London, and also to Mr. C. Wontner Smith, of Finchley, London.

*The Owen Jones Studentship: Certificate and 100*l.* (for travel and study of colour).* Awarded to Mr. Percy E. Nobbs. A medal of merit and 10 guineas was granted to Mr. L. R. Guthrie.

*The Pugin Studentship: Silver Medal and 40*l.** was awarded to Mr. J. Harold Gibbons. A medal of merit and 10 guineas to Mr. A. Muir.

*The Godwin Bursary: Silver Medal and 65*l.**—Four applications were received. The successful competitor was Mr. A. Dunbar Smith.

*The Tite Prize Certificate and 30*l.* (for travel in Italy).*—The subject of the competition was "Design for a pavilion in a public garden." Fourteen competitors entered for the prize. The award was secured by Mr. David Smith, of London, who submitted five strainers.

*The Cates Prize, 40*l.**—Awarded to Mr. A. Halcrow Verstage.

The Grissell Gold Medal and 10 Guineas (for design and construction).—The subject was "Design for a stone dome over a porte-cochère to a large public hall." Eleven competitors submitted designs. Mr. J. B. Fulton was awarded the prize.

Ashpitel Prize.—Mr. W. Greenwood, of Blackburn, was successful.

Professor H. E. ARMSTRONG read a paper entitled

Science Workshops for Schools and Colleges.

He said that the importance of experimental studies carried on with the object of affording training in scientific methods, as a necessary part of the ordinary course in schools generally, whatever their grade, was already so widely recognised that ere long every school would need its workshops as well as its classrooms; it was therefore desirable that the general character of the requirements should be understood, in order that buildings may be properly designed to accommodate all necessary fittings and appurtenances—and more particularly to afford the necessary working space. The whole question of school design might assume a very different aspect in years to come; indeed, the architect might play a by no means unimportant part in helping on reforms which many thought to be very necessary if practical work was to take its proper place in the ordinary curriculum of every school.

Professor Armstrong illustrated his arguments largely by reference to the new buildings at Horsham for Christ's Hospital School, erected to accommodate 800 boys, from the designs of the President and Mr. Ingress Bell. When the position and size of the science block with reference to the other school buildings was noted, it would be obvious that extraordinary importance would be attached to experimental studies in the school. The science block occupied practically one side of a quadrangle, the opposite side of which was occupied by the chapel, the classrooms and school hall filling the third, the dining-hall the fourth side. The floor area of the ordinary classrooms was 15,482 square feet, that of the rooms in the science block was 10,326 square feet.

But the provision which would be made at Horsham for work such as he was contemplating would not be confined to the science block. At no distant date, he trusted, there would be distinct workshops for manual training in wood and metal, and the engineering appliances generally would afford opportunities for the instruction of the more advanced boys in the use of machinery. Moreover, surveying and map-making

would be practised in the country round, and there would be abundant opportunity for other out-of-door studies. Besides school gardens, a set of experimental plots were now being laid down on the lines of those at the Rothamsted Agricultural Station, which had so world-wide a renown. Christ's Hospital School, in fact, ere many years should be a model school; its buildings marked an extraordinary advance, far greater, perhaps, than most of those connected with them realised. As one of the governing body, Professor Armstrong asked to be allowed to say how much he appreciated the great work which Mr. Aston Webb and his colleague had carried out; in watching the progress of the buildings he realised how many things the architect must be to all men.

In designing science workshops the architect and his technical advisers should have three S's in mind—sense, simplicity and space. There should be due knowledge and understanding of the requirements to be met—mere copying should be impossible. The provision made should be of the simplest character possible, because simplicity of provision conduces to simplicity of practice; and the space should be ample, for, given sufficient space, almost anything may be done, and to grant proper space is to show proper respect.

Money spent on judicious ornamentation would always be well spent in the case of a school. Far too little heed was paid to the influence which surroundings exercised on young people; if we are ever to recover the sense of artistic feeling, we must do far more to make our schools attractive. The disregard of property which seemed to be so characteristic of boys at the present day was probably a consequence of the fact that at school they were not placed under conditions which would lead them to be mindful of their surroundings. "Thinking in shape," to quote Thring at Uppingham, was one of the most powerful means of stimulating the imagination and the æsthetic faculties; it was easy to carry out the idea in these days, as magnificent photographic reproductions of the masterpieces of nature and of art were to be had at comparatively small cost: hence neither classroom nor corridor should be without its picture-rail. He would also plead for a more liberal use of colour in our schools.

The fittings at Christ's Hospital were not thought of until long after the building was designed; but, to secure the best result, the building should be designed to the fittings. The science workshops at Christ's Hospital differed in an important manner from the laboratories hitherto provided for schools—there were four main rooms in which classes were held, and to each of these was attached a number of subsidiary rooms. No lecture-room was provided—an omission of set purpose, as it was purposed to discourage didactic teaching. Full provision was made in each room for such didactic teaching as might be necessary; there was a demonstration bench, in front of which sufficient space was left free where seats could be placed; or uprights could be fixed, provided with small desk tops, where students could stand and take notes. No special balance-room was provided. A novel fitting, the balance bench, had been introduced; this was merely a long narrow table (3 feet by 12 feet by 3 feet 6 inches high) covered by a glazed case for the protection of the balances. Instead of having a number of balances within separate glazed cases, one large glazed case had been provided to contain a number of separate uncased balances. The balances placed in such a case are those required for all ordinary work. The more delicate balances required for advanced work were always provided with a case; and, as the sensitive working parts were of agate, there was no need to keep them in a separate room; they were conveniently placed on brackets against the wall.

A third special feature of importance was the store or stock-room attached to each of the four workshops. This was intended not only for the ordinary stores, but also and especially as a room in which the apparatus for experiments left unfinished at the end of a lesson might be set aside until the next attendance.

Professor Armstrong followed with a detailed description of the more important fittings required, viz. working-benches, cupboards, sinks and drains, ventilation hoods and various special appliances. Referring to the regulations of the science branch of the Education Department which specify a water-tap and sink for every two students, the lecturer stated that such a provision was quite unnecessary. The class of work now advocated for schools required the use of water but seldom. Architects must harden their hearts on this point; there was no more reason why sinks should be everywhere in a laboratory than there was to have one in every room in a dwelling-house. The economy involved in localising the water-supply, sinks and drains was very great. At Horsham, in the rooms on the upper floor, all sinks were placed near to the walls, and the waste was carried down to the floor below in pipes fixed in chases in the walls. On the basement floor cross-channels were avoided as much as possible. In the lecturer's experience wooden sinks are far the best, provided that they are built up solidly without dovetailed joints, and that they are always kept partly full of water by arranging the

waste so that it projects several inches (about four) above the bottom of the sink. American white wood seems to be one of the best to use. Sides and bottom should be without joints. All surfaces should be well painted with thin coal tar before they are butted, and the whole surface inside and out should be similarly coated. The waste-pipe should either be somewhat expanded or should have a flange burnt on by means of which it may be held in position by two blocks, one of which—fixed by screws to the under side of the bottom—serves to carry bolts by means of which a second block is caused to clamp the pipe firmly. The space between the pipe and the side of the hole through which the pipe passes is filled in with pitch. The sink is wedged up against the bench top. Such sinks may be made of any size that may be desired, and no plumber is needed to fix them. As regards benches, the lecturer advocated some such arrangement as had been carried out at the Christ's Hospital Girls' School, Hertford, in the new science room (of which a plan was shown) designed by Mr. Stenning—about the simplest and most commonsense plan, he said, that could well be adopted.

The author thought that in future it would be possible to improve considerably upon the arrangements which had been made in the Christ's Hospital Schools, especially in the direction of simplification, by taking carefully into account the character of the fittings to be introduced at the time of designing the building. The ideal to be aimed at was to have the whole of the room, both floor and wall space, available for the work to be done in it. Wall space was invaluable for many mechanical and physical experiments, for blackboards, for shelving, &c. Benches, therefore, should not be fixed permanently against the walls, but should be placed out in the room. Projections into the room should be avoided, and windows be inserted at least 6 feet above the floor.

Whenever possible, steam or hot-water pipes for heating the room should be carried under gratings in channels in the floor. Radiators, &c., take up much space, and interfere with and damage fittings in their neighbourhood.

The lecturer questioned the need of the elaborate provision hitherto made for benches. If sufficient shelving, racks, &c., be provided, and cupboards for general use where necessary, there is little need for cupboards under the benches. He favoured steady, heavy benches of the kitchen-table type. For such benches it was unnecessary to use hard wood; all difficulties of staining, disfigurement and cracks would be overcome by the use of lead-covered benches—a long experience had led the lecturer to prefer these to all others.

With reference to girls' schools, briefly touched upon by Professor Armstrong, he advised that provision should be made, even in the case of girls, for some use of tools. Men had long been victims of academic prejudices, but were seeking to throw them off; the disease was now being contracted by women, and we had to deplore the all too literary bent of the curriculum in girls' schools, whether primary or secondary. By making liberal provision of space for domestic workshops the architect might do much to turn the tide.

With regard to the treatment of wall space, as much as can be spared here and there should be properly prepared, so that it may serve as a blackboard; or the special black canvas, so much used in America, should be fixed against it by battens. Wherever there is spare space stout battens should be fixed to the wall a few feet apart; when these are provided brackets may be fixed up at any time.

With reference to the science workshops in colleges as distinct from those for schools, in minor matters these differ considerably, but in principle they are very much alike. The lecturer observed that if he were called on again to design a laboratory he should greatly simplify the fittings, and follow as nearly as possible the model of the well-arranged factory.

The rules with regard to planning and fitting public elementary schools recently issued by the Board of Education undoubtedly tend to favour over-provision. It is not merely that much more money is spent than necessary, but a false complexion is put upon the work—it becomes drawing-room practice and not workshop practice, and when scholars go out into the world they find themselves placed under altogether strange conditions, unable to use the ordinary tools, and unable either to fit into or to follow the ways of ordinary life. The outcome is most serious; some action must be taken to put the schools on a simpler footing and to bring their work into harmony with ordinary requirements. In conclusion, Professor Armstrong urged that some attempt should now be made to standardise the requirements, both for elementary and secondary schools.

A vote of thanks to Professor Armstrong, proposed by Sir William Abney and seconded by Mr. W. D. Caröe, Mr. John Slater and Mr. J. J. Stevenson, terminated the meeting.

Mr. Andrew Pears has purchased the home of Gilbert White, the Hampshire naturalist, which is situated in the village of Selborne.

SOME PRINCIPLES THAT MAY BE GUIDES FOR THE APPLIED ARTS.*

ASKED to lecture here to-night, I have set myself, I fear, a somewhat difficult task in speaking to you of some of the principles that rule, or should rule, what are called the "applied arts." It were easy to cite examples of the arts—to describe the great works of the past, to catalogue the achievements that the mind of man has conceived and his hand has wrought. It were easy, I mean, to bring facts before you. It is not so easy to tell of ideal principles that should guide, and should enlighten the mind, of the designer or the doer. Yet all art is a thing to be sought after and to be learnt, and it must needs have its principles. Nevertheless, in some sort art is instinctive, spontaneous, and its happiest achievements are those that spring free, sudden, uninvited, the happy inspiration of the moment. It is not for all thus to conceive or thus to achieve. Rules are best for most of us.

Well, I am to speak to-night of some of the principles that may lead us into and guide us along the delightful paths of creative art—creative, for art is nothing if not creative. Are there any such principles? Is art only an inspiration? Or is it only imitative? It cannot be merely an inspiration, for it is certainly learnt, fostered and nurtured and developed by laborious thought of the mind and by the patient labour of the hand and by the traditions of the ages. It cannot be only imitative, for where then comes in the creative faculty? An inspiration may plant a seed, but the seedling will not reach perfection untended and uncultivated.

Here then comes in the use of principles to direct the growth into right ways, to prune, to educe the good and to root up and reject the bad.

This use, this carrying out, of principles in design is not, indeed, the most poetical or the most interesting department of the teaching of art—far from it. It is rather the prose and the common-sense aspect of its initiative. It is very different to that "light that never was on sea or land," it is different to the glad surprise of the joyous thought of an artist's mind, the grand or the beautiful conception, innate with the added creative power of the hand eager to achieve. Rules and laws are but as schoolmasters, and have a manner of restraining and curbing. But to go back to what I have said, are there any principles that may guide us along the path of art? I think there are. First and foremost there is the principle of following nature—nature in her stately grandeur or in her calm beauty. Nature from the "human form divine" to the simplest flower or delicate, tiny shell; from the mighty mountain to the tender grass of the valley. In the highest arts, as in sculpture and painting, there is the obvious principle of closely and faithfully following nature, not indeed without selection and judgment and feeling, and not, above all, without imagination. For we must touch all our art work with human feeling and human thought. Nevertheless, the everlasting law for the arts of painting and sculpture is to be in complete harmony with nature at her best, and to be faithful and true to her teaching. We know the superlative, the astonishing truthfulness of Greek sculpture; how each fragment found, if it be part of a nude statue, for example, is as delicately modelled as the living flesh and the skin-clothed muscles were—how drapery seems as if it were the very petrification of the light, delicate folds of the thin linen that draped the figure. I know not what is most remarkable about Greek sculpture, its beauty or its glad following of nature. This then I would put as the primary rule and principle for all art—the following of nature; and that not only in the forms and shapes of natural objects, but in giving to all things we make the very spirit of nature. Sir Joshua Reynolds wrote:—"It seems to me that there is but one presiding principle which regulates and gives stability to every art. The works, whether of the poets, painters, moralists or historians, which are built upon general nature, live for ever." What lessons of delicate curve and strength and delicate modelling do we not find in the human figure. And this brings me to the next principle that I would mention, one indeed closely allied to that of truth to nature. It is this—to endow everything we make with the expression of life—to give to all our hand-made productions, be they but the common utensils of daily life, be they but pots or pans, or be they crowns for kings and queens, the expression of life. In all the great days of art there was that expression (which, indeed, has a sort of divinity in it) given in all things made. You find it in Greek work; you find it in the work of the Middle Age, in all the civilised countries, when art was healthy and was growing gradually into the astonishing beauty that was produced in the great days of matured art. Everything, after its kind, was made, some more, some less, with an expression of life. In their nervous, graceful, or vigorous curves, in their kindly expression there was life. As you well know many flowers have an expression, some of the most pleasing nature. They smile at you. Well, in the same way the workers in

* A paper read before the Applied Art Section of the Society of Arts, by Mr. G. F. Bodley, R.A., on Tuesday, January 20.

gold, or in silver, or other metal, or in china, or pottery, gave an expression of life to the things they made, though the thing made had no exact resemblance in form to any natural object.

The thing, be it of the commonest type, be it your ink-pot, your chair or your table or wine-glass, or be it a jewelled cross or a silver heart for a lady to wear on her breast; be it a sceptre for a king, or a drinking cup for a child, one and all had, in the best days of art, an expression, nay, as it were, an endowment of life. The hand and the mind of man their maker had so endowed them. No doubt it may require some imagination to see this, and some good things may have it but slightly, and some more, some less.

But now look at modern things of the kind I mean. Except some few made under better auspices, they are dead as the clay or the gold out of which they were made. In the one there is the beautiful curve, full of energy, or it may be of repose, or it is generous of a pleasing and a kindly expression. The other is dull, nay dead, without expression, except indeed it be one of inane ugliness; and even that would seem to have come by chance, so much inanity there is in it. In the one the mind of a man who loved and enjoyed his work is reflected. In the other there is none of this. It is vacant, lifeless, hopeless. When you are at a museum of good old art objects look at them and compare them with nearly all modern manufactures. If you have artistic perceptions you will readily see what I mean. And it is this that I mean—the mind, not alone the hand of its maker, has endowed the object with an expression; and following, in all reverence be it spoken, the divine law of Creation, he has breathed into it the breath of life. Where this is done we have, so far, a work of art. If it is not done it is poor stuff at best. And it is not the richness or the poverty of the thing that brings this to pass, for the simplest object may have the expression of life and, indeed, of beauty, and the richest may be wholly without it.

The late Lord Leighton used to have a small Greek lamp on the mantelshelf in his studio. It was utterly simple in its lines, and without what you would call ornament, but it was not only beautifully designed, it was, to my eye, instinct with the expression of life. I have said that nature was our guide. Well, chairs and lamps, and the proverbial pot and pans, cannot be made like any natural object, or, if so made, they would be wrong, utterly wrong. But they and all things can, in different degrees and in different manners, symbolise life. Is it not this expression of life that makes conventional ornament not only bearable but pleasant in its place and after its manner? You know how, in every style and manner of architectural art conventional ornament has played a conspicuous, an important, nay, I may say, a delightful part. Well, why is this conventional ornament not only to be tolerated, but to be a real pleasure? I think, nay, I am sure, it is because in all good, intelligently designed conventional ornament there is an expression of life. It is this that gives a soul to art. Beautiful beyond compare are the forms of flowers, of leaves, of trees, of the very grass of the field. But more beautiful is their expression of expanding life, whispering perhaps and moving to the gentle air. And this expression you can give to the work of hand-made things—manufactures as we call them. I have mentioned the old testimony of the Creation, "He breathed into them the breath of life." And man, "whose breath is in his nostrils," so frail and passing, with so brief a life, can, if he will, endow his own handiwork, his own creation, with the very semblance of life. It is this that makes the lesser arts noble. And would not this and other principles raise manufactures that are made by the hand of man, directed by his mind, would they not take us, I would ask, into the region of art? I do not mean into the region of high or fine art. Things may be made, and are made, by machinery, helped by the hand of man, without help from his mind. There is no art in such things, only ingenuity. Others may be made by machinery too, but directed by the mind of man. I mean such things as woven tapestries and carpets and other textile fabrics, and they come into the region of art. As we say of some things, "It is quite a work of art." We may truly say so of the best kinds of Eastern carpets, so beautifully made and so beautiful in their colouring.

Have you ever observed how the mind of a weaver of these Oriental carpets works with his hand? For example, when an orange-tinted wool comes against a red, it pales to a more golden hue; when it comes against a blue it will warm or deepen again. The orange against the red would have been hot and unpleasant-looking. Alas! that these Eastern manufactures are so fast degenerating. Indeed, some kinds, or "makes" of carpets that have been beautiful for many centuries (we know some portrayed in the accurate pictures of a Van Eyck or a Memling) have, I am told, recently ceased to be made at all. I hope that Lord Curzon's good work in trying to maintain Indian manufactures may be of use. Not that much Indian furniture is really satisfactory in design. But the carpets and many other textile fabrics are beyond praise. They are delightful, and teach us how colour should be treated in manufactures. They are works of art most certainly. It is

true that fine art takes us into a higher region and to a nobler ideal. But here at this "Society of the Applied Arts" we are, I suppose, on somewhat lower, perhaps more useful ground. But even in the weaving of carpets—in their palpitant of colour—there may be this expression of life as well as in the drawing of their foliage or other ornament. I would that we lived with more beauty round us, and had not the deteriorating influence of the ugly things that crowd around us: life would be happier. How depressing are all ugly things. But I must pass on.

Another principle of art that I would mention is that of breadth of effect. It applies largely to artistic manufactures or manufactures that might be artistic. Now I cannot but think that in art one thing greatly lacking in these days is this grand quality of breadth of effect. I venture to think so of much modern painting, whether of pictures or decorative work. In all the arts breadth of effect is a great quality. Here again look at nature. The low-lying land and the grassy hills, are they not broad in colour, in their vast expanse of green? varied and gradated green, no doubt, as all nature's colouring is gradated, but broadly green. And the sky, is not its great dome at times all blue—gradated indeed again to a silvery tint where it touches the dark green land? And the clouds, are they not at times all tints of grey and at times all that beautiful colour of solemn subdued purple that we call ink? That is so beautiful against the green of the hill or of the trees. I am not forgetting the sunrise or the sunset, but those are but moments of exceptional beauty that linger but for a little while. And the green of the land may be sprinkled with flowers, but they are but as jewels on a robe of one tint.

The more subordinate the nature of decorative work may be the more broad it should be in its treatment. For example, mosaic work for a vaulting or a wall is quite the best if it has but few colours. You may have a gold background, and your figures may be—one all in shades of reds, another all in shades of blues or greens, or a purple robe may be lined with green—colours that have a delightful affinity, and the result will be broad and satisfying. So in marblework—black and white, red and white, green and white—only these two colours together—will be more dignified than if other tints are intermingled, to the loss of breadth of effect. What is it that makes the difference between many new buildings and good old examples of architecture? It is not the charm of age, for that chiefly affects the colour. Is it not that the old work has a noble breadth of effect and a unity of idea, restraint, and an avoidance of all discordant elements? While of much modern work must we not say that vulgar confusion and useless variety and display take the place of suavity of manner and a dignified and noble breadth of effect? For there is in old buildings a nice economy, not only of material, but of ornament, and there is a satisfying charm about most of them of almost any period. The old architecture had stately manners. Too many of our new buildings have pretentious ways. I think it is from the lack of the principle of refinement and especially of a delightful breadth of effect that many things suffer nowadays. It is a principle that extends to literature. Unity of idea is a mark of a great poem, or, indeed, of all good literature. But I am trespassing on to other land.

We live at a time in which there is a considerable feeling after a better and more beautiful treatment of designs for new buildings in our streets. They are certainly becoming more ornate, and more pains is being taken to make them more interesting than in days when the long unlovely streets, like Harley Street or Wimpole Street were built. What seems missing in many, if not most, of these street fronts is a sense of greater dignity and restraint of character; more refinement and more breadth of effect. In one word, a higher conception and a more refined and broad, and a more reasonable carrying out of such conception. The great principle I have spoken of, refinement, is too often absent. Indeed, too many new buildings cannot but be designated as pretentious and vulgar, instead of being dignified and refined. It is a critical time for architecture. I hope we may see better work done, more thorough in the expression of the principle of truth and of a stately beauty both in the humblest and the noblest buildings.

And now one word about colour. I can only briefly touch on this. It is a large subject, and colour is a thing so subtle, so delicate, so strange in its ways that it seems to be beyond rules and laws. For example, you may place one red against another—a crimson lake red against an orange red, in other words, you may mingle your different reds together, and always with happy result. Who has not seen the peasant children in Italy, in the shaded slums of the old town it may be, or in the country under the bright sunlight? Their dresses are frequently—most frequently—reds of different tints, scarlet and crimsons, and all harmonise. In pictures by the old masters you will find one figure in robes of one red, and side by side with it another in a robe of a totally different hue of the same colour; all is harmonious. Now try to do the same with different greens. You cannot. A warm fruity green, beautiful in itself,

will not harmonise with a cold silvery green, though that too may be beautiful—most beautiful—in itself. I am speaking of decorative painting. Why is this? I can find no reason except that colour is so delicate a thing that it is allowed to be free from laws—to be beyond rule, so that I am reminded of a volume of travel in which one of the chapters is headed in the index "The Snakes in Iceland." You turn to the chapter, and all that is said about the subject is, "There are no snakes in Iceland." And so with the laws and principles for colour. Indeed I think there are none. Nevertheless, the eye can be trained, and the taste can be cultivated to love the beautiful in colour as in form. For everything is there the law to be beautiful.

Another principal, or should I say a desirable, practice, is that of founding work on what has gone before. It is at times a charge made by somewhat shallow thinkers, if I may say so, that all work must be entirely original and absolutely new. Sir Joshua Reynolds did not think so of works of painting. He said the best work that had been done in the long history of painting was founded on the work that had been already achieved. He says that such work will be the "most original, though it seems like a paradox to say so."

It is, indeed, but reasonable in the different departments of the arts, it is but natural, to found your work on that of the past. You have a thing to do, you have to design for a certain object. Well, you build, as it were, on the foundations of the past. But you see how this or that can be improved on, refined on, or strengthened. You see it with the eyes of your own mind and conceive it afresh with your own imagination. You develop the original idea, you depart from it, or you give it a new character—a new clothing. In one word, you make it your own. Has not this been so in all the arts? Is it not thus that art hands on its spirit which is immortal? If I were speaking to students of art, I should say, "Fear not to found your work on that of the past ages." Catch the spirit of beautiful work already achieved, and, as it were, grasp the torch from the hand of the doer of work in the past, and throw a newly-directed light with it—a light to fall on a new parting of the ways, ways that may lead to higher heights than yet attained, and to pastures new. That is the way to utilise old traditions. You need not ignore them. Do not so, but use them as stepping-stones to still higher and nobler imaginings.

I could say much more of the guiding principles for art. I could tell you of the principle of strength, not only of strength of construction, but of strength of artistic expression. I could tell you of delicacy without weakness and of power without coarseness. Of truth (and indeed that should have had the first place). I could tell you of harmony and of the avoidance of all harsh and violent contrasts. I could tell you how the nature of the material some use often controls the very first idea of a design and of other characteristics leading to good and artistic work. But I should weary you, indeed I fear I have already done so. One word more, and it is this, while such principles as I have feebly touched on are and should be, as it were, the by-laws of art production, yet in all the arts a healthy, well-informed and well-cultivated imagination is beyond and above all rules.

BOOK-PLATES.

A PAPER on the history of book-plates was read by Mr G. C. Peachey at a meeting of the Berks Archaeological Society. He said a book-plate was a label, printed or engraved, heraldic or otherwise, which was intended to proclaim the ownership of a book when pasted inside its covers or added to its title or fly leaves. In short, it was a mark of possession. Sometimes it was called an "ex-libris," but there were objections to the use of that term, inasmuch as the word "ex-libris" included many marks of ownership which were not, technically speaking, book-plates. The interest to be found in book-plates might vary according to the taste of the student or collector. Most of them had their hobby, and he certainly knew of none which, when seriously studied, appealed to so many instincts as did the collection of book-plates. He was not without hope that his remarks might result in inducing some amongst them to become either students or collectors, and even to enrol themselves as members of the Ex-Libris Society. To those of an historical turn of mind the personal interest came first, and the lecturer then dealt with the book-plates of William Penn, Horace Walpole, Sam Pepys, David Garrick, Sir Francis Fust, Daniel Fleming, &c. By the heraldic style of most, if not all, plates anterior to about 1830 it was possible to give a date, always proximate if not precise, as to the time at which the plate was designed and the owner lived. By recognition of the arms an anonymous plate could be identified, and, if one might believe in the symbolisms of heraldry, the very arms themselves might point to the character and occupation of the man who first assumed them on his coat of armour. He knew of no records which showed at a glance so comprehensive a survey of the changes

which had occurred in heraldic style as a collection of book-plates. The largest collection of book-plates ever made was that of the late Sir Augustus Wollaston Franks, for many years keeper of antiquities to the British Museum. He possessed 150,000 separate plates, which he bequeathed to the nation, and these were now being arranged and catalogued by a book-plate expert, and would shortly be on view. Some people collected one sort of plate and some another, but he urged would-be collectors to master the subject before commencing to buy, and not to buy until they had fully decided upon what their specialty should be. A subject which he would suggest—and which, so far as he knew, was at present unappropriated—was the plates of Berkshire families. Anyone taking the hint would commence by acquiring any plates inscribed with a Berkshire address such as the plate of Bowles of Hanney, Thomas Wilder of Speen, &c. By studying "Burke's Commoners" one would soon get a list of families originating in or settling in Berkshire. Then he would easily ascertain the names of Berkshire peers and baronets, and so on. The lecturer then dealt with the history of book-plates, their rise in fashion, and the changes of the heraldic style and decoration which they exemplified. He said the earliest book-plates, like the earliest printed books, came from Germany, and it was reasonable to suppose that the use of book-plates originated in that country. Three undoubted examples of German plates printed from wood-blocks had come down to them from the fifteenth century, the oldest bearing the date 1450. Mr. Peachey then described the different varieties and changes in book-plates from the fifteenth century down to the present time, and at the close exhibited on a sheet a number of plates from his collection.

A vote of thanks was passed to the lecturer.

ARCHITECT'S FEES.

IN the Longton County Court a claim was heard before Judge Mulholland, K.C., which was brought by Mr. Ralph Dain, architect, Burslem, against Mr. T. I. Cope, solicitor, and Mrs. Cope, of 46 Ricardo Street, Longton, for 17l. 19s. for professional services rendered in connection with alterations made to the residence of the defendants at the above address. The defendants counterclaimed for 25l. damages, alleging that the plaintiff was guilty of negligence in the preparation of the plans and in his superintendence of the building.

In September last the defendants were sued by the contractor who carried out the alterations (Mr. Enoch Barnes) for a balance of account amounting to about 47l., and on that occasion Mr. Dain was called as a witness by Mr. Cope, and assuming every complaint which Mr. Cope raised as to the carrying out of the work had been justified, 5l. at the outside would cover them. Upon this evidence his Honour gave judgment for the plaintiff for the amount claimed, less 5l. With regard to the present claim, some two or three years ago Mr. Dain was invited by Mr. Cope to prepare plans and specifications and detailed drawings with reference to certain work proposed to be done at 46 Ricardo Street. Mr. Dain did so, but after that the matter stood over for some time. Subsequently, fresh instructions were given in reference to the plans, and eventually tenders were invited, and that of Mr. Barnes was accepted, and the work was carried out under the supervision of Mr. Dain. There was no allegation of negligence against the architect at the time of the former trial or until after his account had been rendered. To two bills sent in by Mr. Dain no reply was received, and in October a third application was made on behalf of Mr. Dain. To that Mr. Cope replied that the claim was absolutely incorrect, and he subsequently made specific statements of alleged inaccuracies.

The plaintiff entered the box and deposed that his charges were fair and reasonable and below what he was actually entitled to charge. The first intimation which he received of any negligence was when the counterclaim was delivered. The plaintiff was cross-examined by Mr. Cope as to the frequency of his visits while the work was in progress, and maintained that he gave all requisite attention in the superintendence of the work.

Mr. Cope, for the defence, submitted that the plaintiff was not entitled to recover his 5 per cent commission for the reason that the work under the contract had not been completed, for which there ought to have been a deduction from the contract price, and that there had been negligence which justified the building owner in claiming damages. He called Mr. A. P. Miller, architect, who said he had seen the work done at the house and had examined with respect to the damp-course. He ascertained that it was not in one part of the dining-room, and he could not at all be sure whether it was in the drawing-room or not.

After Mr. Cope had given evidence that there were no deviations or alterations from the plans after the tender was accepted, his Honour, in giving judgment, said he could find nothing to alter the view which he took in the previous action, and on that

Mr. Cope had gone to the Court of Appeal. With respect to the counterclaim, he had listened with great attention to all that had been said, and he could find no evidence of negligence on the part of Mr. Dain of any kind or description. He therefore found for the plaintiff for the amount claimed and also for the plaintiff on the counterclaim.

MR. PRINSEP'S ADDRESSES.

THE first of Mr. Prinsep's lectures to Academy students on painting was delivered on the 12th inst., under the title of "Style and Mannerism." According to the *Standard*, he said that style was hard to define, as it had grown to mean the way in which a man expressed himself, though the word came only from the implement—stylus—used for such expression. He would not speak on this style or on that, but refer rather to the subtle quality understood by "style." Readers were conscious of style in literature, though they could not perceive how it was produced. The two highest ideals of style in the fine arts were Phidias and Michel Angelo, both of whom reached it by their extraordinary tact in omission. They studied nature, but subdued it to their artistic personality. The character of Phidias could be read by his work, and the work of Angelo was a reflection of his character, as could be tested by the literature of his day. Mr. Prinsep said he was forced to use literature as an analogy to what constituted style in painting. When letters began to flourish it was akin to the primitives in painting, then little by little language was perfected by growth and use, not that amplification of words necessarily meant added clearness, for simplicity and clearness were the true signs of style, whether in literature or in art. The finest of all monuments to style in letters was found in the Bible, which had the simplicity of Phidias and the beauty of Angelo, and it was this monument which had kept our language pure, without straining after effect. Next to the Bible, Bunyan was most marked with style. When the Renaissance in Italy was in full vogue, euphemisms and ornate diction appeared in England. Voltaire had declared Shakespeare without style, and, judged by classic authors, that might be so, but to us, of Germanic family, what the Latins condemned was just what appealed to us. The painter most on the lines of Shakespeare was Rembrandt, and he, too, was said to have no style, though his transcendent handling made even a bullock's carcass noble. Johnson's sentences were ponderous, but without style. Macaulay saying that his spoken word was simple, but, in writing, he bolstered it up with padding. Fuseli's extraordinary outpourings in paint were Johnsesque in their laboured manufacture. A writer of epigrammatic order to contrast with Johnson was Gibbon, whose style was admirable, though his mannerisms could be laughed at. Macaulay differed from stylists before him and we could forgive his want of the tact of omission. Prose showed style best, because it revealed thoughts in a simpler and clearer way than poetry could do. Carlyle had picturesqueness, but his style was singularly unlovely, having no flow or melody, but was jerky and difficult to comprehend, yet full of fascination. That greatest of all stylists, whose rhythm and melody were beautiful—Ruskin—was a marked contrast to Carlyle, and Mr. Prinsep read excerpts from each, that from Ruskin being the description of the Clan-Grant district, in which the war-cry of the clan, "Stand fast, Craig Ellachie," says such a telling part. Touching mannerism, the lecturer said it was necessary it should sit easily on a mannerist, and be more of himself a man could put into his work the better. Rembrandt was a true mannerist; in Sterne mannerism was mingling and buffoonery. In painting style was conveyed by colour and form; poetry by colour and effect. Correggio strove to combine style and effect, but both Michel Angelo's and Raphael's best pictures were simple. France was, above all things, fickle, and although Classic authors reigned so long here, it demanded novelty in literature and had not much reverence for style in art. Millet had such a genius for omission, and his forms were so simple, that he might be called a stylist, but even now his greatness was grudgingly allowed in France. Puvis de Chavannes was another stylist, but he made way to rank only after years of obloquy. In England there had been no one with style except Flaxman until Leighton came, but there was a man still living who was senior to Leighton and who was a great stylist. Simplicity must be the aim of care, for in art, as in letters, "ready writing makes good writing, but good writing makes ready writing." In painting—an artist's handwriting—a word must be changed and there. To create a style was most difficult, but it was easier to acquire mannerism. A man need not emulate others, but he should scorn popularity and appeal to the few rather than to the many, adding some of that sentiment which is not in classicism, for picturesqueness and style were not incompatible.

In his second lecture he spoke on nineteenth-century art. Painting, he said, could never be a finite art, as it depended on inexhaustible nature, with the artist's personality in

addition, for no two men are quite alike, any more than two leaves are identical. In the first glorious roll of fame Angelo, Raphael and Titian had been; in the next century Rubens, Velasquez and Rembrandt; later, Reynolds and Gainsborough were among the great elect. Each of these had his own views and his own excellences; for just as bees gather honey from various flowers, and even from blossoms of unwholesome plants, so can painters extract what is sweet from the face of all nature. Painting and sculpture had given forth the thoughts of men at two marked periods—in the third and fourth centuries B.C. in Greece, and in the fifteenth and sixteenth centuries in Italy. Italy, and perhaps Holland, had the greatest number of great artists, but those of Spain and of England could almost be counted on the fingers of one hand. During the Napoleonic war the study of fine Italian art was closed to England, travelling being difficult, and there was then no National Gallery. Freedom, too, is essential to the development of painting. Art withers during war, though it may flourish for a time, as it did under Philip of Spain. Reynolds had profited by the Italians, and he was himself copied more or less slavishly—by Hoppner particularly. Reynolds, though simple, was full of methods, and these methods influenced Northcote and Lawrence, but they could not attain his effects due to glazings. Lawrence was more flashy and direct, truer to likeness, and easier to imitate than Reynolds and Gainsborough. He met with the *dilettantes'* approval and prospered—Wilson did not, and he nearly starved. Art made no progress in the early part of the last century, for literature was more powerful than pictures after the Peninsular War, Byron, Scott, Wordsworth, Shelley and Rogers making way with the people and as social lions. Macaulay divided honours with the new show of hippopotami at the Zoo, and Scott was almost "on view" when he dined out. Later, Dickens's "Pickwick" led to further developments. He, like Ford Madox Brown, was truly British, and might be called the Millais, as Thackeray was the Leighton of literature. Bulwer Lytton, compared with those authors, was pretentious, false to nature, full of theatrical effect, the sentiment of "The Lady of Lyons" just suiting his style, because the sentiment itself was tawdry. Painters, like authors and doctors, had not been held in high esteem socially, and Thackeray's *Gandish* was the first artist introduced in literature. The estimation in which painting had been held was in proportionate relation to the epitaph of a lady amateur. "She painted well in water-colour, she was cousin to Lady Jones, and of such is the Kingdom of Heaven." Scott having dressed his romances in realism, led to anecdotic pictures by Wilkie, Leslie and others. Landseer alone showed a line of his own, yet scored popularity, a love of animals being inherent in our land of sports. Landscape was as traditional as other branches. Titian generalised it so as not to interfere with his figures, and British painters added landscape backgrounds to portraits that had been painted indoors. Poussin was a slave to tradition, and Claude was in a measure conventional, though his technique and his brown tree and ruin in foregrounds to "felt" landscapes were so beautiful. To Canaletto we owed much, as, in defiance of rules, he struck a new line in which the brown tree was not. Wilson, less assertive than Claude, was very captivating, and the one landscapist of his age with heartfelt love of nature. Tribute was paid by the lecturer to the honest outlook of Dutch landscape painters, especially to Rembrandt, and then it was shown that Turner was the first to point out the subtlety of God's work, for men are blind until such as Turner have shown them what to see. Turner began with the brown tree, but little by little he assimilated what was good in the past. Only at the end did he indulge in dexterity which is the bane of so much modern work. Mr. Prinsep drew a comparison between Giorgione and Turner in their Venice pieces, and then touched on Cotman and on Constable, who in his way was superb, but he came back again to Turner, who, he said, was in water-colour as English as Constable, as perfect as Crome, and as weatherful as Cox. It was to the credit of the Academy that it had unstintingly marked its early recognition of Turner's artistic genius, for his personality was unsympathetic, secretive and unsocial. Mr. Prinsep closed his lecture with well-chosen words descriptive of the wondrous qualities of "The Fighting Téméraire."

In the third lecture Mr. Prinsep had much to say about the great writer whose every word tended to elevate the artistic craft. Ruskin himself was never an artist; his knowledge of inanimate nature was exact, but his drawing was almost archaic; outline was his idea of form, and he "shaded," but he did not model. Even sculpture he viewed from a purely literary standpoint; and in painting his admiration went to the workman rather than to the artist, so that the dexterous niggling of Harding appealed to him. The great picture is that which calls up the noblest thoughts, and Turner struck the chord, the response of which came from Ruskin when he saw and described, in poetical language, so much more than the painter himself had felt or intended. Doubtless, this had gratified Turner, as it was right that every

man of imagination should think for himself when the painter had struck the chord. Ruskin's belief in himself was stupendous, but his teachings had never made a great painter, or his writings a great thinker, though by his road-making he had compelled young patricians to see the dignity of labour, and by his books he had taught England how to think on art. The finest preacher or painter could do no more. Ruskinism had the valued recommendation of being serious. It was the truth, the whole truth and nothing but the truth, although Ruskin's own view was singularly limited, for, although so intense about nature, he had never a word on human form. Perhaps he would have excused himself by saying that man's form was warped by the fashion of living, clothes distorting natural proportions; but in answer it could be pointed out that a gnarled and stunted tree gives more pleasure than one of perfect growth; though to this Ruskin might retort that the symmetrical tree was the nobler because it was one of development. Ruskin's was always the literary view, and when dealing with Turner's works he made much of their subject. Mr. Prinsep next touched on that distinct phase of art in the last half of the nineteenth century, the pre-Raphaelite Brotherhood and those allied to them, especially Ford Madox Brown, who, he said, was slow, shy and sensitive, taking a narrow view of life, and never budging from his earliest convictions. His "Christ Washing Peter's Feet" might be called ugly, but it was original and it was sublime, the most religious picture in the whole of the Tate Gallery. Millais's "Huguenots," "Autumn Leaves," "Ophelia" and "The Carpenter's Shop" touched a chord that was never awakened by the latter pictures, full of charm though "The Vale of Rest" and "The Eve of St. Agnes" were. Very tenderly did Mr. Prinsep describe the truth to nature shown by Millais in Ophelia's watery grave, but he also told his hearers that pre-Raphaelitism was essentially a creed for the young, that in all art generalisation is absolutely necessary, and even in literature imagination must be allowed to fill up the gaps. John Bright had said that Gladstone, when speaking, was like a ship following the coast, going round every bay and up every river mouth, but that a great orator should go from headland to headland. This, said the lecturer, was what painters should do, too—in fact, remember Schiller's sentence about the "tact of omission." Regarding foreign influence, Mr. Prinsep said rules were everything to French artists, and any one could see how Delacroix got his effects in his slap-dash work. The French were always striving for new things, but in that clever, bright, fickle and cynical city of Paris how many are serious painters, or in whom eccentricity did not reveal itself rather than true originality. Paris wrecked more artists than it made. Americans, he said, were yet more analytical in their observations than the French, who are such followers of method; but Mr. Prinsep said he knew of no rule in art that could not be broken by a great artist. The English mind had a distinct means of expression, and did not readily absorb the Latin feeling. Young men returned from Paris with dexterous manipulation of aggressive emphasis. Millais, Burne-Jones, Pettie, Holl, Walker, Mason, the Moores were all distinctly English. Leighton alone bore foreign influence. There was much to be got out of our little island, and painters' works should be a strong type of their land.

CRETAN PICTURE WRITING.

AT the Royal Institution on Thursday, the 15th inst., Mr. Arthur Evans gave the first of three lectures on "Pre-Phoenician Writing in Crete and its Bearings on the History of the Alphabet." He said that articulate language was of relatively late development, and that picture-writing was anterior not only to writing, but to speech itself. Even in the Reindeer period hunting scenes were depicted. Later, gestures and sign language gradually enriched human methods of expression. Of gestures added to the picture in this prehistoric period, and expressive of hunger and other feelings, illustrations were thrown on the screen from rock symbols in California. These pictures found in North America had their counterpart in various parts of Europe, and he had himself seen examples in the Maritime Alps and in Andalusia; and in Scandinavia were interesting specimens of rock carving attributable to the Bronze Age. In Ireland and Brittany the rock carvings were of a similar form, and bore like symbolical meanings—records of hunters, death and other events. North Africa disclosed similar remains to those found in the Iberian peninsula. As time went on the tendency to conventionalism and a systematic selection gradually exhibited themselves. The same story was repeated in Babylonia in the cuneiform characters and also in the Hittite inscriptions. In the Nile valley and in Asia Minor the picture writing had become highly formalised, and it was therefore somewhat surprising that similar records were not to be found in the Hellenic world. This was the more remarkable after the discoveries of Schliemann, who amid the relics of a high primitive civilisation, found no picture writing.

Stillman, indeed, found traces of this kind at Knossos. For long it was held that writing was an unknown art, in any form in Homeric times; but his own personal investigations led him to a different conclusion, and in 1893-94, at Athens and in Crete, he found stones which seemed to disclose the existence of prehistoric picture writing. Of these specimens were shown on the screen and explained. These were for the most part seals, but on the libation table in the Dictæan cave of Zeus he found inscriptions, pictographic and linear. There was also in many instances to be found a blending of gesture and language in the picture itself, and this indicated an advanced stage of civilisation. In the Great Palace of Knossos evidence was discovered of pictographic writing, chiefly on shells, and of this system gradually becoming linear. It would be difficult to make out anything like an alphabet out of these materials, the constituents being syllables or half-words rather than letters, but the advance in that direction was clear. The evolution from the purely pictographic to the linear was illustrated by specimens shown on the screen. Thus there came into existence a syllabary growing out of the pictographic forms. There was good reason to believe that this comparatively advanced form of writing, approaching the alphabetic, existed at least as early as 1800 B.C. These might be brought into relation and comparison with Egyptian scarabs of the twelfth dynasty. It might be thought, he safely affirmed that this form of writing could be traced as far back as 3000 B.C. The lecturer showed some remarkable specimens—some of them very primitive in design—of this conventionalised pictographic system in Crete. Remarkable specimens of the first Egyptian dynasty were shown in comparison with early Cretan and Mycenaean forms. His inference was that these forms were not borrowed from Egypt, but were indigenous, though there was reason to believe that from the earliest times there was intercommunication between Crete and Egypt. These Cretan survivals, he thought, might be attributed to the third and even the fourth millennium B.C. Crete, indeed, was in the forefront of civilisation when the rest of the Greek world was in comparative darkness.

HISTORICAL CONGRESS, ROME.

THE Board of Education have received through the Foreign Office a copy of the programme of an International Congress on Historical Studies, which is to be held in Rome on April 2 to 9, 1903. The congress is under the patronage of the King of Italy, and Signor Pasquale Villari is president of the organising committee. The deliberations of the congress will be conducted in eight sections, devoted respectively to ancient history, mediæval and modern history, history of literature, archaeology and numismatics, with history of the fine arts, history of jurisprudence, history of geography, history of philosophy and religions, history of the mathematical, physical and medical sciences. The Board of Education are especially requested to announce that the Italian Government will most welcome a large attendance of British scholars and of representatives of British learned societies and institutions. Those desiring further information should communicate with the secretary of the congress, Signor Giacomo Gorini, committeo direttivo del Congresso Internazionale di Scienze Storiche, 26 Via del Collegio Romano, Rome.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE bi-weekly meeting of the above Society was held on Thursday, January 15, the president, Mr. Butler Wilfrid F.R.I.B.A., in the chair. Amongst those present were Richard Wood and Mr. G. T. Bowman (vice-presidents), H. S. Chorley (hon. secretary), Messrs. Robert P. Oglesby, A. E. Dixon, &c. At the conclusion of the usual business paper, entitled "Rome, Ancient and Modern," was read by Mr. Arthur Marshall, A.R.I.B.A., president of the Nottingham Society. The lecturer remarked that although there was abundant evidence of Regal Rome possessing structures of some magnitude, it was left to Imperial Rome to furnish the city with most striking monuments. The best preserved of these undoubtedly the Arch of Constantine, the sculptures of which had previously adorned other edifices. The Pantheon, Catacombs, the Coliseum amongst others were also described with the assistance of lantern slides, most of them excellently coloured by Mr. Marshall's own hand. A vote of thanks to the lecturer was moved by Mr. H. S. Chorley (hon. secretary), who dwelt upon the fact that a portion of Rome as we see it to-day was built from materials of other and more ancient structures which have since disappeared.

Mr. Robert P. Oglesby, in seconding the vote, referred to the welcome decision of the Italian Minister of Instruction

ace marble records upon the site of vanished structures, thus enabling all to see the positions once occupied by Rome's grand monuments.

In conveying the Society's thanks to the lecturer, Mr. Butler Wilson remarked that the oftener one visited Rome the deeper was the impression left by every succeeding visit. It was quite possible to leave Rome after first acquaintance depressed and overwhelmed by the magnitude of its architectural wealth. Only by repeated visits could Rome be satisfactorily grasped and realised.

THE ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.

A SPECIAL meeting of the Council was held at the Institute Rooms, 20 Lincoln Place, on Monday, Mr. G. C. Ashlin, F.R.I.B.A., president, in the chair. There were also present Sir Thomas Drew, Mr. A. E. Murray, Mr. G. P. Sheridan, Mr. F. Hicks, Mr. R. Caulfield Orpen and Mr. W. E. Parry, hon. secretary.

The matter before the Council was a communication from the Architectural Association of Ireland having reference to a proposal submitted by the Association that the Institute should put on foot a qualifying examination as a condition precedent to admission to the ranks of membership of the Royal Institute. The question gave rise to a very animated discussion, and the hon. secretary was instructed to communicate with the secretary of the Royal Institute of British Architects on the subject and to report to the next regular Council meeting.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE first of the new series of technical demonstrations connected with the above Society was held at the premises of Messrs. John M'Ferran & Co., Beresford Place, on the 15th inst. There was a fair attendance of members. Mr. R. M'Ferran having explained the various qualities of iron pipes, showed a double-socketed pipe, which has the advantages of rapidity in laying, true alignment and resistance to subsequent depression. Various samples of English, Irish and Scotch bricks were brought to the notice of the members, the durability, quality and facilities of manufacture of each being commented upon. The weather-resisting qualities of Irish, Welsh, American and French slates were compared, some excellent examples of the Killaloe slate being especially noticeable. The demonstration concluded with a series of tests on Portland cement by a representative of the firm. Many vivid and practical methods of distinguishing good from bad materials were explained, these latter being very useful to the assembled students. Mr. M'Ferran was assisted by a representative of the Bourtreehill Coal Company. The second demonstration was held yesterday at Mr. Edmund Sharp's premises, Brunswick Street, at 3.30 P.M., the subject being, Building and Decorative Stones and Mosaic.

Chepping Wycombe Municipal Buildings Competition.

SIR,—The conditions for the Chepping Wycombe Municipal Buildings competition contain the following clause:—

"The President of the Royal Institute of British Architects, some architect to be nominated by him, will be asked to select these awards according to his judgment, but the competition does not undertake to carry out any designs, and reserve the right to select for erection any set of designs either awarded a premium or not) they may themselves select."

The President of the Royal Institute of British Architects requests that you will kindly allow him through your columns to inform those concerned in the competition that, as he understands the promoters decline to modify this clause, he has been unable to nominate an assessor.—I am, yours faithfully,

W. J. LOCKE,

Secretary Royal Institute of British Architects.
January 20, 1903.

Messrs. Watkins and Dr. Brook.

SIR,—In your last issue we notice a full report of the meeting of the quarterly board of the Governors of Lincoln County Hospital, at which meeting an attack was made by one of the Governors on our professional integrity. We now enclose you a copy of the *Lincoln Leader* of last Friday's date, in which you will find copies of correspondence

that has taken place between ourselves and the Governor referred to, and in which he unconditionally withdraws all the charges and insinuations he previously made.

We must ask you to be good enough to give the same publicity to this correspondence as you did to the report of the meeting at which the charges were made.—Yours faithfully,

W. WATKINS & SON.

St. Edmonds Chambers, Silver Street, Lincoln:

January 19, 1903.

St. Edmonds Chambers,
Silver Street, Lincoln:

January 10, 1903.

Dear Sir,—Your remarks at the quarterly meeting of the Hospital Governors on the 8th inst. were of such a character and calculated to be so injurious to us in our profession that we are bound to take serious notice of them. You very clearly intimated your belief that we were claiming and obtaining commissions to which we were not entitled, that extravagant expenditure was being incurred under our direction for the sake of the commission thereby obtained, and that we were improperly drawing money professionally from a charitable institution. You must have been fully aware that such remarks were devoid of all warrant and that to make them could not be otherwise than a serious injury to us. Having made your remarks and so insured their broadcast publication, your subsequent attempt to explain them away in no way satisfies us. We must ask you therefore to withdraw without condition or reserve the remarks of which we complain, and in as public a manner as they were made and published. Should you decline to comply with this reasonable request we propose to take the necessary steps to vindicate our professional integrity against your unwarrantable and cruel attack.—Yours truly,

(Signed) W. WATKINS & SON.

C. Brook, Esq., Lincoln.

[COPY.]

Minster Yard, Lincoln:

January 13, 1903.

Dear Sir,—I have received your letter of the 10th inst., and much regret that you should consider any remarks of mine at the quarterly meeting of the Hospital Governors on the 8th inst. to be injurious to you in your profession. With reference to your suggestion that I intimated my belief that you were claiming and obtaining commission from tradesmen to which you were not entitled, I emphatically deny that I made, and I did not intend to make, any imputations to this effect. I think it is probable you assumed, unfairly to me as I submit, that I had this intention, but as soon as I became aware that this was the construction you placed on my remarks, I unhesitatingly withdrew any words which could have favoured this impression, and without reserve I say now that I do not believe that you ever received any illicit commission to which you were not entitled, and if any words of mine could bear any interpretation to this effect, I unreservedly withdraw them and express my regret for the annoyance such suggestions may have caused you. With reference to your further allegations to the effect that I stated that extravagant expenditure was being incurred at the hospital under your direction for the sake of the commission you thereby obtained from the hospital funds, or that you were improperly drawing money professionally from a charitable institution, I entirely repudiate any such charge, which was never suggested or made. It is perfectly true that I asked what commission you obtained, and whether such commission was chargeable upon the accounts of all the tradesmen who supplied goods in connection with the recent new works, and I fail to see what reasonable complaint you can urge against this request. I never suggested that you were improperly running up an expenditure for the purpose of earning increased commission, though it is perfectly obvious upon the replies you gave that the larger the outlay the greater would be your commission. I should be very sorry to suggest that this has influenced you in recommending any expenditure at the hospital which has not been justifiable, and I deny most emphatically that I made any suggestions of professional misconduct in what you have done, and I regret exceedingly that you should have attributed to me an imputation which I should be very sorry to make upon a gentleman of your integrity and position. If therefore you think that any remarks I made are such as to prejudice your professional reputation I willingly withdraw them, but at the same time I reserve to myself the fullest right, as one of the Governors, to criticise the existing arrangements under which remuneration is paid to the surveyor for services rendered to the Institution. I propose to send a copy of your letter to this reply to the chairman of the weekly board with a request that he will be good enough to read them at the next meeting of the weekly board.—Yours faithfully,

(Signed) CHARLES BROOK.

To W. Watkins, Esq.

[COPY.]

St. Edmonds Chambers,
Silver Street, Lincoln :
January 15, 1903.

Dear Sir,—We have to acknowledge the receipt of your letter of the 13th instant, addressed to our Mr. Watkins senior, and are very glad to accept your assurance that it was not your intention to make any imputations against our professional conduct, and that if any words of yours could bear such an interpretation you unreservedly withdraw them and express your regret for the annoyance such suggestions may have caused us. As these imputations were commonly understood, from your words as reported in the public press to have been made, it only remains that equal publicity should be given to your present full exoneration; we therefore propose to send a copy of your correspondence to the press. We could have wished that such publication which the justice of the case requires had been volunteered by you. We would only further observe that a discussion of the mode in which architects are remunerated may or may not be a matter of general public interest; but if it is, a meeting of hospital governors is scarcely a fitting place for such a debate, nor should the proper and agreed remuneration of their architects be the subject of critical and adverse comment.—Yours truly,

(Signed) W. WATKINS & SON.

C. Brook, Esq, Lincoln.

Dear Sir,—I am quite agreeable to your making any use you may desire of my letter —Yours faithfully,

(Signed) CHARLES BROOK.

To W. Watkins, Esquire.

GENERAL.

The McKinley Memorial.—We are requested to announce that foreign artists—that is, all non-residents of the United States of America—who are desirous of competing for this Memorial at Philadelphia must communicate their intention of so doing on or before February 1 to Mr. Leslie W. Miller, 320 South Broad Street, Philadelphia, Pa., U.S.A., forwarding him the bills of lading, stating name of vessel on which drawings are being sent, and then they will be admitted free of duty and responsibility taken for their return in due course.

The Prince of Wales has consented to lay the foundation-stone of the new workmen's dwellings which are to be erected by the Westminster City Council in Regency Street. The date of the ceremony has not yet been fixed.

The Prince and Princess of Wales will be present at the dedication of the nave of Truro Cathedral, which will take place probably in the last week of June or the first week of July.

The Drawings, photographs, plans and casts illustrative of Mr. Arthur Evans's excavations at the palace of Knossos, Crete, will remain on view during the whole time of the winter exhibition at the Royal Academy is open, namely, till March 14, instead of during January only, as previously announced.

The South Molton Corporation, Devon, will shortly seek power to borrow money for the erection of workmen's dwellings to be let at 5 $\frac{1}{2}$ %, 6% and 7% a year.

The Luxembourg is supposed to contain only works by living artists. Pictures and drawings by the following artists were accordingly lately removed to the new galleries of the Louvre:—Cabat, Daumier, Jules Dupré, François, Jean Gigoux, Isabey, Ch. Jacque, Emile Lévy, Robert-Fleury, Viollet Le Duc, Cals, Mottez, Tassaert and Meissonier.

The Westminster City Council have resolved to plant trees in Whitehall and Parliament Street from Horse Guards Avenue to Bridge Street on both sides of the roadway. Sir John Wolfe-Barry, a member of the Council, undertook to give the trees, and an estimate of 229 $\frac{1}{2}$ s. for planting them and supplying grids, guards and kerbs was approved.

Mr. William Ridgeway, M.A., Fellow of Gonville and Caius College, Cambridge, has been re-elected for a further period of five years to the Disney Professorship of Archaeology.

A Memorial to the late Archbishop of Canterbury is to be raised in the county of Devon. It is to take the form of a new west window and brass or other memorial tablet in Exeter Cathedral. Over 3,000 $\frac{1}{2}$ will be required.

The Lord Chief Justice will preside at the meeting of the Society of Arts on Wednesday evening, the 28th inst., when a paper on "The Cost of Municipal Trading" will be read by Mr. Dixon H. Davies.

M. Nenot, the architect, is now temporarily acting as secretary of the Académie des Beaux-Arts.

The Scheme for a Mono-rail from London to Brighton is not likely to be proceeded with, owing to the opposition prepared by the Brighton Railway Company against the scheme on Standing Orders, and to enable the arrangements for the construction of the Mono-rail between Manchester and Liverpool to be completed. The promoters of the City and Crystal Palace Tube Railway have also abandoned their scheme for the coming Session.

The Westminster City Council have resolved:—"That a communication be addressed to His Majesty's Government suggesting that the Royal Commission about to be appointed to inquire into the congestion of traffic in the streets of London be directed to receive evidence and report upon the obstruction caused by the breaking-up and use of the streets by companies and other undertakers under statutory powers to lay pipes, wires, &c., and execute works over, under, across and along the streets, and also as to the advantage and practicability of requiring such pipes, wires, works, &c., to be placed in subways under the streets."

The Yacht Club of France has decided to organise an exhibition intended to encourage marine painters. The first exhibition will commence on February 7 at Paris.

The Hove Town Council having proposed to introduce and work tramways in the borough at the cost of the ratepayers, a poll was demanded by the Hove ratepayers' defence committee. The counting of the votes was superintended by the Mayor; 3,111 votes were given in favour of the resolution to promote the Bill and 4,185 against the Bill, making a majority of 1,074 votes against the Bill. There were 2,161 individual voters for the resolution and 1,806 against.

The Rev. P. Rousset, a missionary in Natal, has made an appeal to French Catholics for funds to erect a chapel in Napoleon's Kop in Zululand, where the Prince Imperial was killed. The Empress Eugénie, however, opposes the project as the true monument to the prince has been erected at Fainburg.

Mr. George Frampton, R.A., having completed his portrait of Mr. James Fleming, chairman of the Governors of the Glasgow School of Art, it was recently unveiled at the institution.

The Court of Common Council have instructed the Library committee to consider whether, having regard to the interest of historic associations attached to the signs in Lombard Street which the Court had ordered to be removed, a request should be made to the owners to present them to the Guildhall Museum.

Mr. A. C. Gow, R.A., and Mr. W. F. Yeames, R.A., have each received commissions to execute frescoes for the alabaster at the Royal Exchange. Mr. Yeames will have as subject "King Henry VIII. bestowing on the Mercers' Company the License to build St. Paul's School."

Mr. Henry Hart, for thirty-six years district surveyor of North-West Kensington, died on the 16th inst. at the age of eighty-eight.

The Old Exchequer and Audit Offices which were formerly located at Somerset House, having been removed to new premises on the Thames Embankment near Blackfriars Bridge, the offices thus vacated are being structurally altered and renovated in order that additional accommodation may be provided for the Inland Revenue Department.

A Block of buildings to be known as King Edward VII. Memorial is now in progress at Port Elizabeth, South Africa. The architects are Messrs Jones & McWilliams, and the contractors are Messrs. Rochelle & Smith. The contract amount is 35,000 $\frac{1}{2}$.

Mr. Saint Gaudens, the American sculptor, has announced to the committee that the monument of Robert Louis Stevenson, which was to be set up in St. Giles, Edinburgh, this summer, has been delayed owing to his illness. The relief, which is the body of the memorial, is being cast in bronze.

Mr. Carnegie has purchased two houses adjoining Shakespeare's birthplace, and has presented them to the trustees in order that they may be removed and the sites become part of the birthday garden.

Mr. Ralph Hedley, R.B.A., will deliver an address before the Northern Architectural Association on Wednesday evening upon "Sketching in Charcoal."

Papers will be read at the meeting of the Institution of Civil Engineers on Tuesday by Mr. Maurice Fitzmaurice, C.M.G., on "The Nile Reservoir, Assouan," and by Mr. F. Stokes on "Sluices and Lock-gates of the Nile Reservoir, Assouan."

The Library Supply Company have added to their list of appliances for offices an "Auto-fix Case," which is well adapted for architects and others who wish to preserve apart their illustrations as appear in this Journal.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

BRISTOL.—Feb. 9.—The Bristol School Board invite designs for school premises at Moorfields, St. George, Bristol. The competition will be restricted to Bristol architects. Mr. W. Avery Adams, clerk to the School Board, Guildhall.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

CASTLEFORD, YORKS.—Mar. 31.—Designs are invited for a free library. Premiums 15*l.* and 10*l.* respectively. Mr. H. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

SMETHWICK.—Jan. 31.—Competitive designs and tenders are invited for erection of a refuse destructor. Mr. C. J. Fox Allin, borough surveyor, Town Hall, Smethwick.

ST. IVES, CORNWALL.—Jan. 31.—Competitive plans are invited for the erection of municipal buildings, to consist of a guildhall, council-chamber, jury room, public hall, town clerk's office, surveyor's office, treasurer's office, muniment room, parochial office, mayor's parlour and fire-brigade station and offices. Premiums of 70*l.* and 30*l.* respectively will be awarded to the architects whose plans and specifications are considered to be first and second in order of merit. Mr. Edward Boase, town clerk, Town Clerk's Office, St. Ives, Cornwall.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C.E., borough surveyor, Council House, Sutton Coldfield.

WORKINGTON.—Jan. 31.—For restoration of St. John's Church, Workington. Mr. James Howes, architect, 106 Harrington Road, Workington.

THE sub-committee of the Lord Provost's committee of the Edinburgh Town Council, on a motion by Councillor Wilson as to the number of the staff of the burgh engineer's department, have submitted their report to his lordship's committee. They reported that the staff, as authorised by the Council, consisted of 1 burgh engineer, 28 assistants, 43 inspectors and 66 workmen—138 in all; that the staff at present employed consisted of 1 burgh engineer, 24 assistants, 28 inspectors and 45 workmen—a total of 98; and that since the date of their remit, June 1902, 31 officers had left the service of the department. The sub-committee recommended that for the future the staff should comprise 1 burgh engineer, 18 assistants, 28 inspectors and 44 workmen—a total of 91, and that the burgh engineer be empowered to employ a number of men for extra duty when required, not exceeding 9. It was pointed out by the sub-committee that until the magistrates and Council finally determined whether the burgh engineer should in the future discharge such extra duties as have fallen to him of late in connection with the cabling of the tramways and the housing of the working classes schemes, he would have difficulty in suggesting any further permanent reduction of the present staff. The Lord Provost's committee approved the report.

TENDERS.

LEICESTER.—Feb. 3.—For supply of 1,000,000 Jarrah or Karri wood-paving blocks. Mr. E. George Mawbey, borough surveyor, Town Hall, Leicester.

TRADE NOTES.

THE "Cliff," Tutbury, has recently been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd, engineers, Liverpool, employing their ornamental "Rahnee" radiators.

MESSRS. WILLIAM POTTS & SONS, clock manufacturers, Leeds, have erected a large illuminated turret clock for H.M. Government at the new Post Office Savings Bank, Kensington. The same firm have also erected a large double-dial turret bracket clock for the Edmonton Coronation committee.

OWING to the great curtailment of showroom space rendered inevitable by the rebuilding of their extensive premises, Messrs. Hewetson, of 204 & 212 Tottenham Court Road, are holding a "rebuilding sale" of carpets, cabinet-work, curtains, floor rugs, decorations, bedsteads and bedding, linoleums, upholstery, china and glass, &c, details of which are fully set forth in the neat little brochure which the firm is issuing. From this we gather that the prices show a very *bona fide* reduction all round, and that some very genuine bargains may be secured, if an early visit be paid.

MR. WILLIAM AUGUSTUS GIBSON, at one time president of the American Elevator Company, and more recently managing director of the Otis Elevator Company, Ltd, has organised and registered a company for the manufacture and sale of lifts under the title "William Augustus Gibson, Ltd.," one of the claims of which to public support is that only best material and workmanship are to be employed, and another is that all the machinery of the company will be made in this country.

MR. THOMAS SMITH, steam and electric crane manufacturer, of Rodley, near Leeds, has taken his sons into partnership, and the business will henceforth be carried on under the style of Thomas Smith & Sons. In this connection

various improvements have been carried out in the works, which are now of the most modern and up-to-date nature. New and improved machinery has been introduced into every department for the economical and efficient manufacture of every type of electrical, steam and other cranes, and every description of lifting machinery for which the firm is specially noted and to which it devotes its attention exclusively. A new installation of plant for electrical driving (supplied by the Westinghouse Electric Construction Company and other well-known makers) has been laid down, the power being provided by one of the very latest types of high-speed Belliss & Morcom's engines.

VARIETIES.

THE Local Government Board, having considered the report of their inspector upon the local inquiry held with reference to the application of the Scarborough Town Council for sanction to borrow 720*l.* for permanent works in connection with the new smallpox hospital, have informed the Corporation that they are not prepared to sanction the loan, on account of various objections.

THE new premises of the Whitehaven Young Men's Christian Association were formally opened on Tuesday by Lord Kinnaird, the vice-president of the National Council. The premises are situate in Irish Street, and are admirably suited to the needs of the Association. The cost has been about 2,000*l.*, towards which about 1,000*l.* had been raised before Tuesday's ceremony.

THE alterations made in Ednam Church, Edinburgh, amount to a reconstruction of the edifice, with the exception of its walls and seating. A vestry and entrance, built fifty years ago at the east end, have been removed, and a chancel of good proportions built. The entrance has been transferred to the south-west end, where a porch has been erected. A commodious vestry is built on the north side. The old windows have been built up or altered into Gothic forms, the larger having Early Decorated tracery. Internally the new roof is open and ceiled with stained and varnished wood, nearly to the ridge. The floor of the church and chancel are of pitch pine and block flooring, each with its own pattern. The floor of the chancel is raised 1 foot above that of the church, and divided from it by red-tinted concrete the width of the chancel arch, and on this the base of the pulpit is formed. The chancel is approached by two broad Sicilian marble steps

The pulpit, which is the gift of the minister, is octagonal, in oak, with raised panels, three of which have carving and an oval moulding, enclosing ecclesiastic symbols and interlacing foliage. The church is comfortable, heated with hot-water pipes and ventilated. The alterations were carried out from plans by Messrs. Hardy & Wight, architects, Edinburgh, and have cost about 700*l.*

THE forty-eighth annual report of the Wesleyan Connexional chapel committee gives evidence of remarkable progress in chapel and school extension throughout the country. This year new enterprises have been sanctioned which in the aggregate amount to 625,234*l.* Clearing off chapel debts has also discharged 45,269*l.*, or 11,356*l.* more than was paid off last year. The total amount of debt discharged during the period of the chapel committee's administration is 2,703,518*l.* The amount of completed cases is 223,523*l.* Sanction has been given for the erection of 119 new chapels, at an estimated cost of 403,179*l.*, an increase on the previous year of 206,983*l.* and an increase of 28 new chapels. There are also 175 cases of alterations, which in many cases amount to reconstruction, and represent an additional expenditure of 155,200*l.*, an increase of 81,486*l.* The total additional accommodation provided in the new chapels is 24,600 sittings.

ELECTRIC NOTES.

EIGHTEEN months ago the Pudsey Corporation obtained a provisional order for lighting part of the town by electricity. The order will lapse next August, but nevertheless no action is likely under it. The reason is that whilst the cost of carrying out the scheme was from 18,000*l.* to 20,000*l.*, the demand for electric light was comparatively small. A new scheme is, however, brought before the Council by Mr. A. E. Vickers, chairman of the electricity sub-committee, which proposes that a generating station should be rented and 5,000*l.* spent on plant. By this means 4,000 eight candle-power lights might be provided, and extensions be made as the demand increased.

MR. S. W. BAYNES, chief electrical engineer of the St. Pancras Borough Council's successful electric undertaking, has obtained the sanction of the Council to fitting four new boilers at the King's Road generating station with oil fuel apparatus. From this he confidently anticipates various advantages, namely (1) complete absence of smoke; (2) cleanliness, there being no coal dust or ashes to handle or dispose of; (3) saving of labour—one man per shift looking after the

steaming of ten to fifteen boilers; (4) ease of control or manipulation, a boiler being instantly raised to full duty or shut down entirely by the simple manipulation of the burner controlling valves. The Council have further, on the recommendation of their electricity committee, sanctioned an expenditure of 1,046*l.* for providing oil storage, feed-pipes, &c.

BUILDING AND BUILDERS.

MESSRS. J. RYAN & SONS, of Limerick, have obtained the contract for the new post office which is about to be erected in that city.

THE West Riding authorities have received a communication from the clerk to the North Riding asylum in which the suggestion is made that the hospital for consumptive lunatics should be erected in proximity to one of the larger asylums in the county, and that patients from the other two Ridings should be sent there as out-county patients. The matter has been referred to the superintendents of the three asylums in the West Riding with instructions to report.

PLANS are in course of preparation by the Chiswick District Council for the provision of entirely new machinery at their sewage disposal works, the motive power to be gas, supplied from the gas company's mains, with the view to the abandonment of the whole of the existing machinery at the works; and advertisements will be issued inviting tenders for the supply and erection of the machinery, and also of a dust destructor suitable for the requirements of the district.

PLANS have been passed by the building committee of the St. Anne's (Lancs) Council for a palatial hydropathic establishment to be erected by a private company on a site bordering Fairhaven and St. Anne's. The building, which is to be called the Dunes hotel, will have a frontage of 190 feet to Clifton Drive, and be five storeys high. It will be equipped with

needle, electric, Russian, vapour, German and plunge baths, and lighted throughout by electricity. It will contain no fewer than seventy-two bedrooms. The building will be one of the largest in the town. The architects are Messrs. Woodhouse & Willoughby, of Manchester.

THE Harrogate Corporation sanitary committee has met to consider a new scheme of sewage disposal. The Corporation have had before them several schemes. Within the past few days Messrs. Strachan & Watson, two eminent engineers, have been consulted by the Corporation, and the committee have now decided to make land—belonging to the trustees of Dorothy Dare—adequate for their requirements. The Corporation propose to deal with the sewage by septic tanks, following this treatment by double percolation on the north side, but by single percolation on the south of the borough. The estimated cost of the scheme is about 95,000*l.* The new scheme is calculated to save 350*l.* a year for pumping, or capitalised about 10,000*l.*

THE Royal Victoria hospital, Belfast, which is approaching completion, and which has been erected under the supervision of Messrs. Henman & Cooper, architects, of Birmingham, has been constructed on most up-to-date lines. The greater portion of the flooring has been laid by Diespeker, Ltd., in their Venetian marble mosaic, which was selected in competition with other firms for its durability, the hardest marbles only of their respective kinds being used in its composition. The angles between the walls and floors have been formed with a curved skirting, which leaves no place for dirt or dust to lodge, and in the laundry block the channels and dishings of the various gulleys and outlets have also been formed in mosaic by the same company. The total quantity is upwards of 4,000 yards.

LAST week Mr D. W. Kemp addressed the members of the Edinburgh Building Trades Exchange on "The Duchess of Sutherland's New Technical School at Golspie." After describing the school, which is to be erected early this spring, Mr. Kemp stated that the money for the building had been provided by the Duke of Sutherland and Mr. Carnegie, each giving 5,000*l.* The students in the first instance would be all young men, the expense of whose maintenance and education would be met by bursaries, thirty-five of which had already been subscribed by various persons interested. The architect of the school, Mr. J. M. Dick Peddie, had prepared the plans, which were exhibited to the meeting.

And at Glasgow, Leeds, Birmingham, &c.

COLONEL A. G. DURNFORD, R.E., inspector of the Local Government Board, attended at the Hampton Urban District Council offices on the 14th inst., and held an inquiry into the Council's application for sanction to borrow 3,313*l.* for sewerage, sewage disposal and surface water drainage, together with 502*l.* for depôt purposes. Mr. Edgar Cosens appeared in support of the application, and the proceedings were purely formal. Later the same day an inquiry was held into the Council's application to borrow 14,685*l.* for the erection of fifty-six dwellings for artisans. The evidence adduced in support of the application was practically the same as that tendered at the recent inquiry into the purchase of Rosehill estate, where it is intended to erect the proposed cottages. The inspector promised to report to the Local Government at an early date, so that the work may not be delayed.

THE annual general meeting of the Master Builders' Association of Ireland was held on the 15th inst. in the Grosvenor hotel, Westland Row, Dublin, Mr. James Beckett (president) in the chair. The report and financial statement for the past year were considered approved, and it was decided to invest a further sum of the funds of the Association. The election of officers for the ensuing year was then proceeded with. The following were elected:—President, Mr. James Beckett; hon. treasurer, Mr. James Kiernan; hon. secretary, Mr. John Good, 55 Great Brunswick Street, Dublin. Committee, Messrs. R. Denne Bolton, Thomas Connolly, W. Foley, Thomas Mackey, W. Meade, H. Pemberton, E. Warren and B. W. Whyte. It was decided to hold the annual dinner on the 12th prox. A vote of thanks having been passed to the outgoing officers, the meeting adjourned.

A STEP further has been taken in regard to the proposed extension of the Renfrew and Clydebank Joint Hospital at Blawarthill. At a meeting of the Board in Clydebank, the clerk (Mr. Hepburn) submitted plans and estimates for the extension, showing the total amount to be 12,809*l.* The plans and estimates were unanimously agreed to, with an instruction to the burgh representatives on the Hospital Board to exercise their best efforts in hastening on the completion of the necessary arrangements. It was also reported that the district committee of the County Council of Renfrew had approved of the extension, but that the burgh of Renfrew had declined to be a party thereto. It was resolved to ask the district committee to join in a representation to the Local Government Board in terms of the minute of agreement constituting the Hospital Board.

THE Nottingham City Council have just been discussing the erection of working-class dwellings on land belonging to the Corporation, and during the course of an interesting debate on the subject Dr. Milner said the condition of houses in certain parts of the town was very bad indeed. The dwellings were mainly all back-to-back houses, by which Nottingham was very unfavourably placed, having for its population more back-to-back houses than any other city in England. These houses contained four or five rooms, each room often inhabited by six or seven people, and the partitions between the houses were sometimes merely rags stretched over frames. These insanitary conditions caused diseases of the chest, rheumatism and typhoid fever to be very prevalent in the city. In the end the matter was referred to the estates committee, who will bring up a report in the near future.

YORKSHIRE BUILDERS' FEDERATION.

AT the annual dinner, in Sheffield, of the Yorkshire Federation of Building Trades Employers, Mr. J. Dawson (Huddersfield), president of the Federation, was chairman.

Mr. S. Smethurst proposed "The Yorkshire Federation." He said there was a very useful function before these federations. If they were thoroughly well organised they could arrange differences and eliminate grievances without resorting to force and a brutal system of fighting which ought to be out of date.

Mr. Mansfield said the northern section had done much to show that only reasonableness and justice were wanted. Years ago builders were helpless in the hands of the trades unions, but now they had got into the sunshine of liberty. They ought to nurse the institution that had done so much for them.

Mr. E. R. Good said he was not antagonistic to trades unionism, but he challenged any English workman to say that the practice of trades unionism had in any sense approached the ideal of this title in the last fifty years. Instead of being unionism it had been coercion and tyranny under the leadership of unscrupulous men.

Mr. J. Dawson said the master builders had been forced to federate by the unreasonableness of the workmen. By persuasion and talking over disputes they had done good service in preventing strikes or lock-outs, and that was the great end they had in view. For twenty years the men had done practi-

cally as they liked, but as the law had recently been interpreted by the judges those practices had to stop. Indeed, the tables had been turned to some extent, for an employer who was threatened with the black list brought an action against the men and won his case, getting 500% damages. The men filed their petition and the employer got nothing, but it was not a very long step from getting damages against the men to getting damages from the union funds. They need never fear the demands of the men if they held together, were loyal to the local association and made sacrifices for one another's good.

Mr. A. Sinclair proposed "The City and Trade of Sheffield." During the five years' existence of the Yorkshire Federation, he said, no town had given less trouble to the executive than Sheffield.

Mr. W. H. Lancashire said he thought municipal trading was going too far when it went into the building trade. He had never been in favour of the works construction committee, believing that with the large undertakings already in hand they could have dispensed with a committee of that kind. It was undesirable that a Corporation should enter into strong competition with the trades of the city, and they ought to be content with bringing their present schemes to the greatest perfection, and give private traders a fair chance of earning a living.

Mr. Longden said builders preferred to pay good wages if they could only get the equivalent amount of good work done. Unfortunately of late years the pay had increased and the work had decreased. By forming their Association they had got a better understanding between the men and the employers, and where there used to be a score of strikes they now did not get more than two or three.

Mr. Muir Wilson said the works construction committee was the greatest sham, farce and iniquity in connection with the Corporation. He was going to move that it be dissolved, but he doubted whether he should be successful against the blind majority that sat in the Council prepared to deny a fair share of work to a representative of the ratepayers. But there was a time coming when these matters would be placed in a proper light. For a Corporation to build was an encroachment upon the rights of private trading.

Mr. J. Wright submitted the toast of "The National Association." He said they did not wish to interfere with trades unionists in their right to combine and sell their labour at the best price, but they did say they should not interfere with those willing to work for the masters. The reason they

wished for the success of the National Association was that in large disputes and general matters the building trades should be actually represented, and, if necessary, take united action. He suggested that it would be advantageous to appoint a national managing secretary, and have a head office to carry on the Association's business with a continuous policy, with a national building journal edited at that office.

Alderman W. H. Jessop, in response, welcomed the idea of a permanent staff, and said builders would hail with joy the day when a Minister of Commerce was appointed, with a seat in the Cabinet. He regretted the fact that only 20 per cent. of the builders of the land were included in the Association, and urged upon members to advocate the claims of the Federation on those who had not joined.

PAVING OF STREETS.

THE Glasgow Corporation recently appointed a sub-committee to report on the paving of streets and the construction of conduits. Among the places visited were London, Liverpool, St. Helens, Paris, Vienna, Berlin, Hamburg, Hanover and Brussels. The following report is the result:—

We, in view of the widening and improvement of Nelson Street, City, by the City Improvements Department of the Corporation, recommend the Corporation to construct in that street, when it is being widened and re-formed, an experimental and well-ventilated conduit for the reception of all service pipes, cables or wires required for public or private purposes, including those of the gas, water, electricity and telephone departments of the Corporation, as also those of the Post Office and any other service pipes, cables or wires that the Corporation may agree to receive.

In our view such conduit should be constructed by and at the cost of the committee on statute labour, who should have the control and management thereof.

Cross-connections, extending on each side of the street to the kerb, and suitable for carrying branch pipes or wires from such conduit to the properties adjoining the street, should also be made by the committee on statute labour at certain points to suit the requirements of those properties. The whole expense of making such cross-connections should ultimately be borne by the owners of the particular properties for whose use the connections are made, but the connections should, like the

conduit itself, be under the control and management of that committee. The cost of those connections should be paid by those owners when use is made thereof by them in connection with their properties.

For the use of the conduits by the various departments of the Corporation and others annual charges should be made by the committee on statute labour according to a tariff to be fixed by the Corporation.

Sewage should not be introduced into the conduit, but should be conveyed in a pipe or sewer independent of the conduit. Any necessary connection between the conduit and the pipe or sewer should be adequately trapped.

In the event of such a conduit being constructed in Nelson Street, and the Corporation being satisfied with the efficiency thereof, it would be for the Corporation to say in any further widening or reconstruction of streets, or in the construction of any new streets of importance, whether conduits should then be introduced into those streets.

In streets without tramways, in and near to the business parts of the city, and in main thoroughfares through the suburbs, in which there is more or less continuous traffic, and where the gradient is not steeper than, say, 1 in 55, the paving thereof should, in our opinion, be of asphalt. Our view is that there should be throughout the city a very great extension of asphalt paving. Where, in the same class of streets, the gradient is, say, between 1 in 55 and 1 in 40, the paving should be of hard wood, and in such class of streets there should also be a considerable extension of that class of paving. Again, in the same class of streets, where, however, the gradient is steeper than 1 in 40, the paving thereof should, according to circumstances, be square dressed setts, either of granite or of whin. Where, in such streets as have been described, there are tramways, and where the gradient is not steeper than 1 in 40, the paving thereof should, if possible, be of asphalt or hard wood, but the case of each such street would require to be considered on its particular merits. Where, again, in such described streets having tramways, and where the gradient is steeper than 1 in 40, the paving to be used should be that of square-dressed setts.

In the case of those streets in the central and other districts of the city where there are no tramways and where the other traffic is not great, and which are more or less of a residential character, the paving thereof should, according to gradient, be of asphalt or hard wood, unless that gradient is so steep as to render the adoption of smooth paving inadvisable.

In suburban streets of a main or important character, and which may or may not have tramways, the paving should also be of asphalt. In the less important of those streets the paving (where the gradient is not clearly unsuitable) should probably be that of tar macadam, and in the remaining streets having little or no vehicular traffic the paving should be that of ordinary macadam.

As regards private streets, including courts and lanes, the paving to be adopted should, in our view, be as far as possible that recommended in the case of central and district and suburban streets, but each such street must be determined by its special and particular requirements, its situation and its gradients; and, of course, it must be kept in view as regards those private streets that the demand of the master of works for a particular kind of paving by the proprietors is subject to the review of the Dean of Guild Court on the questions of the reasonableness and necessity of the requisition made.

Rubble causeway being, in our view, so insanitary, and otherwise very objectionable, should as far as possible both in public and private streets be superseded whenever opportunity arises. In some cases that course might be economically adopted by covering the rubble with a coating of asphalt.

Where smooth paving is adopted in any street all gullies and manholes therein should be effectually trapped, or otherwise so constructed as to prevent detritus being carried into the sewers. Of course due provision would at the same time require to be made for the adequate ventilation of the sewers.

If the Corporation should see fit to adopt the foregoing recommendations as to the smooth paving of streets, it would, of course, be expedient, if not indeed necessary, that there should be an extensive and frequent sanding of the streets so paved, and that, as in London and elsewhere, accommodation should be provided at junctions of streets or other suitable places for storing the sand or gravel to be used.

Private streets should not, as heretofore, be taken over by the Corporation as public streets on a payment being made by the proprietors interested to the Corporation to relieve them of their statutory obligations as regards the cleansing, lighting and maintaining of such streets. The primary and controlling condition on which such private streets should be taken over by the Corporation as public streets should be that those streets be or be put into a condition satisfactory to the committee on statute labour and in conformity with the foregoing recommendations.

A new street should not be taken over by the Corporation

as a public street until two-thirds, or at least one-half, of the buildings to be erected thereon have been actually erected. Otherwise no contribution, or, at all events, no fair or adequate contribution, towards the cleansing, lighting and maintaining thereof by the Corporation would be made by the proprietors; and, moreover, such partly-built-on street would very probably be afterwards put into serious disrepair by the further building operations therein, and by the necessary heavy traffic in connection with those operations, and such disrepair would have to be made good at the expense of the Corporation.

We are strongly of opinion that in lieu of the present practice of entering into contracts with varying conditions for the paving with asphalt of separate streets, the system should be adopted of dividing the city into districts, and the Corporation entering into contracts with responsible firms for the paving with asphalt of such streets within those districts as may from time to time be determined on by the committee; that is to say, that the existing practice as regards the ordinary paving with granite or whin of streets in districts should be made applicable to the paving with asphalt. Such contracts too should certainly be of some considerable duration as the committee might determine, and in the contracts it should also be provided that the contractors who laid the streets should, on terms to be provided for in the contract, maintain the streets for such period of years as might be resolved on and mutually arranged.

Again, where smooth paving is adopted, all the pipes and cables of the various departments of the Corporation, and those of the Post Office and others should, in some systematic manner, and as far as possible, be laid in lanes or in the footpaths, and not in the roadway as at present. We feel so strongly on this point that we are prepared to recommend the Corporation, under the powers conferred on them by the Glasgow Police Acts or otherwise, to undertake the maintenance of those pavements in which pipes or cables are laid, with the right, however, to the Corporation, through the committee on statute labour, to make a small annual charge against those departments or the Post Office, or companies whose pipes or cables are there laid, to cover the extra cost of maintenance of the pavements.

In our view the Corporation should endeavour to arrange with the proprietors interested, as a condition of taking over the burden of maintenance, for the acquisition of the whole surface and solum of the pavements, on such pavements being in or being put into good order by the proprietors. If in or

after being put into such order and taken over, the Corporation would, of course, maintain the whole of such pavements, subject, however, to their right to make charges, as aforesaid, against any department, the Post Office or any company using part of such solum for placing pipes and cables.

In new streets to be made in the city, the various departments and companies, as also the Post Office, should, where there are no conduits, be taken bound to, as far as possible, lay their pipes and cables in the footpaths thereof, and not in the roadway.

In any street where pipes or cables are laid by such department or company, or by the Post Office, such department or company or the Post Office should be obliged and taken bound to make reasonable provision for the future requirements of or developments in their respective undertakings.

MANCHESTER BUILDERS AND "FAIR CONTRACTS."

THE Manchester City Council, having at the instance of the local trades council adopted a "fair contract clause," it has been introduced in the conditions for a new fire and police-station. The following letters on the subject were addressed by the Manchester and Salford Builders' Association to the Town Clerk:—

Manchester and Salford Master Builders' Association,
Cromwell Buildings, Blackfriars Street,
Manchester:
December 23, 1902.

Amended Form of Building Contract and the Fair Wages Clause.

Dear Sir,—At a meeting of this Association, held yesterday, I was instructed to write and say that my members are of opinion that the new conditions proposed to be introduced into your form of contract will have wider and more far-reaching effects than the Corporation either intend or anticipate.

I have further to say that my members regret they cannot tender for any work under the proposed conditions, and particularly under clause 42, but they will be pleased to confer with your committee or officials on the subject.—Yours faithfully,
JOHN TOMLINSON, Secretary.

The second letter is as follows:—

January 6, 1903.

Dear Sir,—At a meeting of the building contractors interested in Corporation work, held at this office to-day, I was instructed to write and point out the objections the federated employers have to signing any contract agreement containing the new clause adopted by the Corporation at their November meeting, which they consider will have many far-reaching and injurious effects, so far as the building trade is concerned, and which were, perhaps, scarcely foreseen by the Council when the clause was under consideration.

In the first place, I would point out that my members very strongly object to the words, "Contractors tendering for or executing work under this Council must be paying the standard rate of wages to the whole of their workpeople, and observing the hours of labour recognised by the local organised bodies of workers in the various trades affected in the districts where such work being executed," for the following reasons:—

1. By this clause a contractor having a job in Manchester for the Corporation could be required to pay the wages recognised by the Manchester trade-unionists to the whole of his workpeople wherever they might be employed, and whilst a Manchester employer could be required to pay Manchester wages to men he employs in other towns where wages are much lower, an employer at, say, Stockport, Bury or Preston, could be required to pay his local staff at the Manchester rate if he had a Manchester Corporation contract, thereby handicapping employers who are working for the Corporation.

2. The use of the words "local organised bodies of workers" places it in the power of any organised trades society to fix their own rate of wages and hours of labour, and if a contractor has signed the Corporation clause, he could be forced by the Corporation to observe such rates or hours, or run the risk of having his contract cancelled. Thus the employers would have no voice in fixing wages, &c., as trade agreements with operatives in the building trades cannot be enforced at law, and there could be no resisting the men's demands by strikes or lock-outs, as this would practically mean giving up the contract, a position in which very few employers would care to be placed.

3. Most building trades contractors have in their employ a number of old men who are not able to do full work, and who are by recognised custom paid below the standard rate; under this clause these men could no longer be employed except at the risk of a cancelled contract.

My members also object to the use of the words:—"The principal contractor shall be responsible, however, for all work done and for its being carried out under the same conditions as if executed by himself," not as it applies to responsibility for quality of work, but in respect to its application under the first part of the clause previously objected to.

On every building contract there are about a dozen different trades employed, and it would be practically impossible for a sub-contractor who sub-lets a considerable portion of the work, and has to purchase a large quantity of the materials, to ascertain that all workpeople executing such work or manufacturing such materials are paid the rate of wages, &c., that their trade union might demand for them. For ironwork from Scotland, steel girders from Belgium, tiles from the Potteries, earthenware from various centres, locks and screws from Birmingham, granite from Aberdeen, and stone of all kinds from various quarries, &c., you ask the sub-contractor to be responsible, and should any of the producers of these materials be guilty of a trifling offence against trade unionist requirements, you take power to cancel the whole contract, not only involving the contractor in serious loss in the first instance, with a possibility of having to indemnify the Corporation for extra cost of completion, but you lay him open to an action for loss and damages by each and all of his sub-contractors.

Again, my members object to the onus of proof being thrown upon the contractor on any vexatious complaints, made by labour delegates or other responsible persons, for though they might find no difficulties in showing compliance with the conditions so far as their own workpeople were concerned, the trouble in the case of sub-contractors' and manufacturers' employes would be so great that no self-respecting contractor would pledge himself to undertake it on account of what might prove a very trifling matter.

Many of my members also very strongly object to your requirement that their sub-contractors should be approved by the Council, as they consider that they are by a long experience better able to judge of the fitness of a firm to do the work required than even the members of the Council, whilst they think that so long as the sub-contractor is well known and established, and is willing to take the responsibility for the proper execution of the contract, it is undesirable that they should be tied to such sub-contractors as the Council think fit. The Government and railway companies do not make such conditions.

In conclusion, my members altogether object to the ve-

trastie penalty that the Corporation take power to enforce for what might be a very trivial offence, and they hope your Council will reconsider the matter.—I am, yours faithfully,

JAMES TOMLINSON, Secretary.

The subject will be discussed at the Council meeting to be held on February 4.

CREWE MUNICIPAL BUILDINGS.

MR. R. H. BICKNELL, C.E., inspector for the Local Government Board, held an inquiry at Crewe on the 15th inst. into an application by the Town Council for sanction to borrow 18,000*l.* for new municipal buildings.

The Inspector asked what were the outstanding loans of Crewe, and Mr. Cooke (town clerk) said that sanction had been obtained for 138,801*l.*, although all the loans had not been taken up. In reply to a further question the town clerk said that the assessable value of Crewe for general district rate purposes was 136,842*l.* When they took up all the loans for which sanction had been obtained their indebtedness would exceed by 2,000*l.* their total rateable value for one year.

Mr. H. T. Hare, of London, produced plans of the proposed new buildings.

The Inspector reminded the town clerk that ten years ago the Local Government Board sanctioned a loan of 2,500*l.* for new municipal buildings, which were then described as likely to be sufficient for fifty years.

The Town Clerk said that at that time they could not have prophesied the great increase of Crewe. They wanted new provision for the town clerk and staff, the borough accountant, the rate collectors and the sanitary inspectors. Those offices would be on the ground floor. Above would be three offices for the borough surveyor, one for the medical officer of health (with a small laboratory) and a room for the school attendance officer.

The Architect said that the buildings would be lit by electric light and ventilated by an electric fan. The estimated cost, with the furnishing, was about 18,000*l.*; the building would be on the Corporation's freehold land.

The Inspector said it looked pretty elaborate for the money. The Local Government Board, before they gave their sanction for the loan, would require quantities to be got out and tenders from competent contractors. The Council could invite tenders and accept one provisionally, subject to getting the sanction

of the Local Government Board for the loan. The Local Government Board had been driven to that by the manner in which loans had often been exceeded, in some cases by 100 per cent. Excess loan inquiries were most unpleasant. There was no opposition to the application.

THE STRAND-HOLBORN IMPROVEMENT.

ACCORDING to the report of the improvements committee of the London County Council, every effort has been made to expedite the works in connection with the Holborn-to-Strand improvement. The Council is now in possession of the whole of the property between Catherine Street and the Law Courts on the Strand frontage, besides most of the land needed for the new crescent road, and nearly all the houses have been demolished.

The work of forming the new street from Holborn to the Strand and clearing the insanitary area at Clare Market is being undertaken as one scheme. In the Clare Market area about 3,038 persons of the working class were displaced, and the scheme sanctioned by the Home Office was that accommodation should be provided for 750 persons on the cleared land at Clare Market and for 1,500 persons at Millbank. For the new street about 3,700 persons of the working class will be displaced, and the scheme sanctioned by the Home Office is that accommodation shall be provided as follows:—250 on the Duke's Court and Marquis Court sites, 799 in a lodging-house in Drury Lane, 1,681 on the Reid's Brewery site, 680 on the Herbrand Street site and 290 at Millbank.

In carrying out the complete scheme of improvement it will be necessary to acquire in all forty-nine licensed houses, and the Council has decided to continue the policy hitherto maintained and to abandon these licenses.

The widening of Southampton Row between High Holborn and Eagle Street has been completed, and the widening of the remaining portion of that thoroughfare will be undertaken at an early date. The formation of the portion of the new street immediately south of Holborn will be undertaken in the course of two or three months.

The work of widening the Strand has involved the acquisition of portions of the churchyards of St. Mary-le-Strand and St. Clement Danes. The Act requires the Council to undertake the removal and reinterment of all human remains which

may be found in the parts of the churchyards required for the improvement. The Council accordingly made arrangements for the removal of the remains and their reinterment in the consecrated portion of Brookwood cemetery. All the work connected with the widening of the Strand from Catherine Street to the Law Courts has been completed, including the new sewer and the subway for pipes, wires, &c. The work connected with the formation of the eastern portion of the new crescent road, which will commence at the Strand close to St Clement Danes Church and will re-enter the Strand at Catherine Street, has been commenced.

The acquisition of property needed for improvements necessarily occupies a lengthy period. Much as the Council may strive to press the negotiations to a successful issue, the same spirit of expedition does not always characterise the action of the claimants and their agents. The public, observing that the houses are not removed, think that the Council is responsible for the delay, with the result that numerous complaints of dilatoriness are frequently made when the Council has been doing its utmost to carry out the improvements with expedition. When all interests in the property have been acquired the materials of the houses are sold by auction and the premises are demolished. Contract drawings for the paving and other works having been prepared, the sewerage and paving works are at once commenced and pressed on with rapidity.

"From the facts above stated," say the committee, "it will be apparent that we have spared no efforts to expedite as much as possible all the work connected with the very large and important improvements now in course of progress in the Strand and between that thoroughfare and Holborn."

MANCHESTER ASSOCIATION OF ENGINEERS.

THE seventh meeting of the forty-seventh discussion session of the Manchester Association of Engineers was held at the Grand Hotel on Saturday evening, the 17th inst., when an address was given by the president, Mr. E. G. Constantine. Speaking of the developments in engineering science and practice, he said that in the present generation electricity, for instance, had emerged from an abstract science into a concrete practical force. This and the triumphs of Marconi showed that the wildest flights of fancy in connection with electricity might one day be realised. The only limit to the

practical application of the electric current was the cost of generation, and this was gradually being reduced. From small dynamos we had grown to large generators driven by slower-speed reciprocating engines, and the perfecting of the steam turbine was leading to the adoption of still larger units for the conversion of lines of force into electric current. We were already familiar with the idea of 5,500 kilowatt-power turbo-generators. But before it could be generally used the current would have to be generated at a lower cost than now. In this connection a question of interest to engineers was whether the reciprocating steam-engine would be supplanted by the steam turbine. One could not think of an ideal steam turbine without being fascinated by the beauty of a motor in which the moving parts should always be in equilibrium, practically annihilating friction and wear and tear; where the motor only required starting and would run indefinitely as long as the steam supply was maintained. According to data obtained from tests made of two 1,000-kilowatt condensing turbines, working with steam at 140-lbs. pressure and about 25 degrees Fahr. superheat, the steam consumption amounted to only 14.2 lbs. per electric horse-power per hour. With a higher steam pressure, a greater superheat and the experience obtained in the further adoption of this form of motor, it was more than probable that for large powers the economical working of steam turbines would rival if not surpass that of the best design of reciprocating engines, of which it would be regarded as a formidable competitor in the future. Referring to boilers, which he said were too much neglected, Mr. Constantine said he had no hesitation in saying that in stationary boilers it was more than doubtful whether the average amount of heat obtained from the fuel and converted into useful work in generating steam exceeded 55 per cent. of the calorific value of the fuel, or whether the average combined efficiency of the boilers and economisers employed in the industries of this country was more than 65 per cent. There was no valid reason why, with a properly designed plant, 80 per cent. efficiency should not be obtained from the boilers and economisers combined, and yet this result was, to say the least, uncommon. A saving of 10 per cent. of the many millions of tons of fuel which were annually consumed in the furnaces of steam boilers, converted into money, would liquidate the cost of the Boer war. They were all too familiar with the frequent newspaper statements that we were being ousted from foreign markets by American and German competitors. If the writers of many of these alarmist articles had taken the trouble to

study the Board of Trade returns of our exports of steam-engines and machinery, instead of being so ready to jump to conclusions on erroneous data, they would not have found any indications of our decadence. If figures had any meaning at all, Britain had more than held her own in the world's markets for engineering work. This, too, was only part of the story, for in the last few years very large sums had been spent on engineering work in industrial development at home. To whatever causes it was to be attributed, the fact remained that during the last four or five years there had been such a reorganisation, extension and installing of new engineering works as had never before been experienced in Great Britain. Many firms had been thoroughly awakened to the danger of becoming obsolete, realising that "sitting still" spelled industrial extinction, with the result that some millions sterling had been expended in bricks, mortar and improved machinery with a view to increased output at lower cost. Among the progressive firms this district was exceedingly well represented, and he was probably well within the mark in estimating that not less than 700,000*l.* to 800,000*l.* had been invested in this manner within three or four years in the immediate neighbourhood of Manchester, without taking into account the reputed expenditure of 1,700,000*l.* by the British Vestinghouse Company at Trafford Park. A feature in the economic position full of good omen was the change—amounting to almost a revolution—in the attitude of the workmen towards progress. The introduction and acceptance of the "premium" system of payment, the encouragement of workmen to make suggestions regarding improved methods of producing work, the visits of the men and representatives of trade unions to other countries to investigate the conditions of labour were all steps tending to break down the dead level of mediocrity so fatal to advancement, and to stimulate healthy emulation leading to greater efficiency and to that community of interests which should in the future prevent the resort to suicidal strikes as a means of settling disputes. The manner in which the necessities of present-day conditions were being realised and dealt with by an ever-increasing number of those engaged in the engineering industries, the greater attention which was being paid to technical and commercial education, the recent reform in the patent law, principally brought about by the agitation instituted by the Manchester Chamber of Commerce, and other signs of the times, justified him in the confident prediction that we should be able to retain our engineering grip on neutral markets in spite of all comers.

LIVERPOOL INFIRMARY FOR CHILDREN.

THE new out-patient department of the Liverpool Infirmary for children was opened on Wednesday by the Countess of Derby. The building now completed forms only a portion of the scheme which the President and committee hope to carry out in the near future and for which they invited architects to submit designs in a limited competition, particulars of their previous experience in hospital work having to be stated, as well as the list of works they had carried out. The designs of six architects—three from London, one from the Midlands and two from Liverpool—were considered, and finally that of Messrs. Haigh & Thompson were selected as the best. Their design is now on view in the board-room of the present infirmary.

The new "extern" stands alone, surrounded by streets on three sides and a public passage on the fourth; it has therefore been possible to obtain light and ventilation on all sides. The patients' entrance is at the south-west angle of the building, approached from Mulberry Street, and exactly opposite the infirmary. It opens into a space for the accommodation of perambulators, and through this communicates directly with a large waiting-hall. The latter is placed in the centre of the building, and round it are grouped the various consulting, examining and operating rooms. Near the entrance is a registration-room, adjoining which an isolation-room is provided from which infectious cases can be removed without their re-entering the main building. The dispensary is suitably placed opposite the principal entrance, to the right of which are also conveniences for the women and children. At the north end of the building, next Mulberry Street, is the entrance for the staff, near which the various rooms for doctors and nurses are situated, with lavatories and other conveniences. An ophthalmic room is provided, also a store for splints, &c. At this end of the building are placed the heating-cellar in the basement, and on the first floor accommodation for the keeper and his wife, with a small yard.

The building generally is one storey high; the waiting hall being higher than the adjoining rooms (and above the keeper's yard, which is on the first floor) can therefore be lighted and ventilated on four sides, which is an obvious advantage in getting a blow through. The rooms are warmed by hot water, the fresh air passing through the radiators. Provision is also made for admitting fresh air by means of "Leather's" venti-

ANDREW WILSON writes as follows:—"The Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (*i.e.* germless) water, and thus prevent Typhoid and many other diseases."

BERKEFELD FILTER CO. Ltd. 121 OXFORD STREET, LONDON, W.

lators. All windows have opening casements. The various rooms have extract ventilators connected with the trunk in the roof, which is turned into an automatic ventilator fixed in the centre of the ridge to the main roof.

The interior walls are lined with glazed bricks dado high, having round internal and external angles, both horizontally and vertically. All the joints have been finished flush with Parian cement. The wall surfaces above the glazed bricks have been rendered in Portland cement, finished with a smooth surface of Parian, which has been painted in white Ripolin. The floors have been paved with terazzo generally, but some with wood block and "Litosile." The front entrance has an inclined plane without steps. All lavatories, sinks, water-closets, &c., are bracketed from walls, without floor supports. Electric light has been fitted throughout. The building has been built of Accrington red bricks, with Darley Dale stone dressings, the roofs being slated.

The sole contractors of the new out-patients' building were Messrs. Holme & Green; warming, Messrs. Killick & Cochran; terrazzo floors, Messrs. John Stubbs & Sons; metal casements, railings, &c., Mr. George Wragge; electric lighting, Messrs. Harford & Co.; plumbing and painting, Messrs. Cottrill & Beszant; sanitary fittings, Messrs. Doulton; slating and plastering, Messrs. Tanner & Sons; while the furnishing contract was let to Mr. James Parkinson, excepting the benches, which were made by Messrs. Bennet, of Glasgow.

The new infirmary, which is to be erected on the old site, is designed on what is known as the pavilion plan—one pavilion running north and south on the Mulberry Street boundary of site, and the other having a corresponding aspect, parallel to the Liverpool Gymnasium, but 27 feet away. The south gables of both pavilions will come up to the Myrtle Street boundary line. Between these wings is placed the administrative block, facing Myrtle Street, but set well back, with the principal entrance in the centre. The nurses' home is arranged on the St. Mary's recreation-ground boundary, but is connected with the main central block by a "conservatory bridge." The pathological department is situate in the north-west angle of site, and the boiler-house and detached isolation block on the rear boundary.

The following is a brief description of the accommodation:—There will be five main wards in pavilion blocks for twenty cots each, one on the ground floor and two on the first floor for medical cases, and two on the second floor for surgical cases. In the centre of these two latter, in administration block, and

facing the north, is placed the operating-room, with anaesthetic and sterilising rooms adjoining. The ground floor of one pavilion is planned to accommodate three resident medical officers, with sitting, dining-rooms, &c., together with the secretary's office. The board-room and lady superintendent's quarters are situated near the principal entrance.

On the first and second floors over, the playrooms for children occur, with large outside sun balconies facing the south. The various floors of this centre block contain the clinical, ophthalmic, linen and clothes rooms, ward kitchens, food stores, &c. The porters have their sitting and bedroom accommodation in the basement, on which floor is also placed the reception-room, dispensary, stores, linen airing, sorting and folding rooms, and linen and blanket rooms in connection with the sewing-room.

The kitchens, larders, dairy, &c., are on the third floor, and the maids' sleeping accommodation over each ward pavilion. The various floors are served by two staircases, one being the main or principal, in the centre of which is a large lift, which travels from basement to top storey. This lift is for the conveyance of patients, staff, cooked food and goods, ambulance, &c. The cooked food in hot jacketed trollies will be conveyed in this manner to the different wards, dining-rooms, &c.

The nurses' home provides accommodation for forty-two nurses, with separate sitting and bedrooms for the sisters. An infirmary is also provided for sick nurses. The isolation block is planned for four cots, and is in itself a complete, though small, hospital.

Generally the buildings are planned in detached blocks so as to insure a perfect circulation of air all round each, and in no case will a single soil drain pass under the buildings, all being readily accessible for inspection. Electric light will be used throughout. Warming will be by open fires, supplemented by steam or hot-water pipes and radiators. The ventilation is to be on the "natural" principle, all windows opening and arranged so that they can be cleaned from the inside. To the buildings throughout adequate fire escape stairs are provided. All sanitary conveniences are completely cut off by disconnecting lobbies. Fireproof construction will be provided throughout the main buildings, and fire hydrants placed in convenient positions.

Externally the elevations are boldly treated in brick and stone, with slated and leaded roofs, the whole being designed to be complementary to and in conformity with the new out-patients' department.

CABOT'S INSULATING & DEAFENING QUILT

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. D moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING

A fireproofing result infinitely superior that obtained with sheet asbestos, and, tically-perfect sound-deadening, can be in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT"

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17
Double Ply...	1 : 16 : 6	1 : 0
Asbestos ...	2 : 16 : 6	1 : 10

Bales containing 500 square feet of half-bales 250 square feet. Weights: Single ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

THE B. & S. FOLDING GATE CO

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

The Architect.

THE WEEK.

THE fearful fire at the Colney Hatch Asylum, which broke out about 5.30 on Tuesday morning, must excite alarm about the safety of other institutions of that class. The increase of lunacy during late years makes it necessary that flimsy buildings should be improvised. Five huts formed of corrugated iron and wood were the scene of Tuesday's disaster. Similar structures are to be found elsewhere, and one has been lately constructed at Epsom which is to contain 700 women. It is not to be denied that asylum accommodation for London and Middlesex is insufficient. The huts which were destroyed have existed for about seven years. But we suppose there was a continual change of patients in them. The circumstances at the time of the outbreak were unfavourable. The fire occurred at an early hour, and the high wind spread the flames. Colney Hatch is somewhat out of the way, and difficult to approach. An hour had elapsed before an adequate number of engines and firemen were on the spot, and then the tragedy had been consummated. The provision in the asylum for emergencies was on too small a scale to cope with so large a fire, and the water supply was deficient. If it were not for the energy, courage and self-sacrifice of the staff the victims must have been far more numerous. But of 330 inmates in the annexe 52 have perished. The calamity will, we hope, be made the subject of a more far-reaching inquiry than a coroner's inquest. When helpless patients who are deprived of reason, and are therefore unable to extricate themselves from danger, are locked up in frail shanties, it would seem as if the most deplorable consequences were being invited. As yet authorities in general appear to be unable to realise how suddenly fire may break out, and how difficult it is to master the flames. Nowhere are temporary buildings so much out of place as in a lunatic asylum. We hope, therefore, the Home Secretary will give instructions for more care to be exercised in the licensing of huts which in any way resemble those which have been so easily annihilated at Colney Hatch.

THE difficulty of fixing a building line in suburban districts was suggested by a case heard on appeal in the last Quarter Sessions of Liverpool. The West Lancashire Rural District Council summoned a builder for infringement at Formby, and he was convicted. He appealed. It appeared that he sent in plans for the erection of shops and houses in Elson Road and Andrew's Lane as far back as March 1895, but the work was not commenced until last September. Meanwhile a house had been erected in the road and another in the lane, and the builder was notified that he must not go beyond the main wall in either case. The surveyor to the Rural District Council stated that one residence was set back 39 feet 6 inches, and the other 25 feet, and those building lines should be accepted unless there was special authority to the contrary. On behalf of the appellant it was contended that the building line was only an artificial line, and evidence was given that there was scarcely a road in the township where the buildings were in line, and in fact a definite frontage line was unknown in Formby. The magistrates decided to allow the appeal as respected the road, but not in the lane, and the costs were to be assessed respectively.

WE referred a month ago to the decision of Mr. Justice BUCKLEY in *TOLLER v. SPIERS & POND, LTD.*, in which it was decided that the owner of property had no legal right to enter on premises which were leased in order to carry out the provisions of the Factory and Workshop Act. We then said that we considered the judgment to be almost sufficient to render the Act inoperative, for in a large building where there were several leaseholders the opposition of one could nullify the provisions of the Act. The subject was brought before the meeting of the London County Council on Tuesday. The Building Act Committee reported that the effect of the judgment would appear to be

to make it practically impossible for the Council to deal with any "old" factory premises other than those which were wholly in one occupation and those which were tenement factories within the definition contained in the Act, as construed by Mr. Justice BUCKLEY—that is, premises the whole of which was occupied as factories, the mechanical power for which was supplied from one common source. It would be easy for the owner of a factory building, by letting such building to more than one occupier, to nullify the provisions of section 14 of the Factory and Workshop Act, 1901. Already it is extremely difficult to carry out the provisions of the Act owing to the liability to trespass. It has been found that out of 106 cases one in four, or twenty six in all, cannot be effectively dealt with owing to questions of trespass. The Council intend for the future to remit to the Home Secretary all cases with which it is unable to deal effectively under the present law, and the Home Secretary is to be asked to receive a deputation to urge the necessity of the introduction of legislation to remove the difficulties arising from questions of trespass in the administration of the Factory and Workshop Act, 1901.

SEVERAL years ago Mr. E. A. HEFFER was closely associated as secretary to the local society of architects with the architecture of Liverpool. Among his buildings in that city is the church of St. Bridget. Dr. STUBBS, the present Dean of Ely, belonged to it, and he describes it as "a building which, especially as to its interior, for loftiness of conception and nobility of proportion, is acknowledged by all good judges to be one of the most impressive modern basilican churches in England." As Mr. HEFFER continues to be as capable and as enthusiastic as ever, it was anticipated by his friends that he would signalise himself in the competition for the new cathedral. Owing, however, to a misunderstanding of the meaning of the circular, he did not send in a design which he had prepared. It has, however, been published in connection with a sermon which was preached by the Dean on behalf of the project. Dr. STUBBS says that "for originality of design, nobility of proportion, skill in mass-grouping, and general beauty of outline, it is worthy of the very best traditions of the old English master-builders, and one which all Liverpool men would be proud to see taking shape as the mother church of city and diocese on St. James's Mount." One of the features in the design is an octagon, 85 feet in diameter and 165 feet to the crown of the vault. It is pointed out by the author that the angles "do not rise from the walls, as at St. Paul's and Ely, but are free from them, a double aisle coming between the octagon and the circular turrets containing the triforium stairs. This arrangement is probably unique, the idea being to give additional floor-space, and at the same time increase the beauty and importance of the centre of the cathedral by opening it up all round." Dean STUBBS testifies that Ely Cathedral is a much easier building to speak in than many a parish church of a twentieth part of its size. For the style of his building Mr. HEFFER has drawn inspiration from Westminster Abbey. It is to be regretted that so excellent a design did not come under the notice of the assessors. The pamphlet, containing a sermon by Dean STUBBS, with the design, is published by Mr. WALMSLEY, Liverpool.

SOME time ago we published an article on Celtic interlaced ornament which was partly written by an Irish gentleman, Mr. COOKE-TRENCH, who gave much attention to the subject of Celtic art. He was a member of the Council of the Kildare Archaeological Society until his death. At the annual meeting a few days ago a vote of condolence was passed to his family, for he was one of the Society's most distinguished members, and had aided it since its foundation. His theory was that Celtic artists first covered the space they were to decorate with straight lines, crossing one another and woven in and out like basketwork. The ends were then formed. Finally, the crossings were obliterated occasionally. The operation was not entirely mechanical, for much depended on the skill with which the lines were joined in parts while other parts were obliterated. In whatever way it is explained, there is no doubt the process must have been slow.

"IRON WORKING."—By J. C. HORSLEY, R.A.

RUSKIN AS A CRITIC.*

IN the interesting and eloquent lectures which Mr. VAL PRINSEP has just delivered to students of the Academy he referred to Mr. RUSKIN's influence at some length. It is not the first time the critic was dealt with by Academy Professors. Indeed, it would hardly be possible to treat of landscape painting or of some of the old masters without recognising the popular notions on the subjects, and which were derived from his books. It was to be expected that the limitations of the writer's power should be set forth. Mr. PRINSEP says that RUSKIN was never an artist; that he always took the literary view, and that even sculpture was regarded from a purely literary standpoint. Probably the majority of artists are of the same opinion, and it may be worth while briefly to examine how far it is to be accepted. An opportunity to do so is afforded by the publication in a handy volume of the notes on pictures at the Royal Academy and other exhibitions, as well as those on SAMUEL PROUT and WILLIAM HUNT.

It must be allowed that Mr. RUSKIN was, if possible, more amenable to such criticism as Mr. PRINSEP has expressed, if judged by architects. The exclamation wrung from PUGIN, "Why doesn't the fellow build something!" was a summary expression of the discontent which justly arises in an architect's mind when a critic deals with his work as if it were little more than an abstraction or independent of all sublunary necessities. RUSKIN spent so much time in the contemplation of nature, he appeared to think that every building should possess some of the characteristics of the Alps. It might also be concluded from his writings that architects could be as free in the exercise of their creative faculty as was TURNER himself. "Genteel houses" were an abomination in Mr. RUSKIN's sight, but he forgot that the raising of them, in spite of all their shortcomings, was a sign of progress and an attempt on the part of imperfect beings to attain as much beauty as their limited purses allowed. Indeed, in none of his criticisms is Mr. RUSKIN so far removed from this life of ours as when he treats of modern buildings. It is well, however, to remember the class of people to whom Mr. RUSKIN addressed himself. He had the writer's gift, and was eager to appeal to a great number. He wished to be accepted as an authority on art like FARADAY on science. If his books were expensive he believed that self-denial would be cheerfully undergone to purchase them. He altered his style and almost ceased to be eloquent in the expectation of reaching a wider circle. If he confined himself to technicalities which artists alone could understand, the possibility was that he would not be read by the very men for whom he made sacrifices. In his review of the "Materials for a History of Oil Painting" he endeavoured to be more technical than EASTLAKE himself, but

it is to be doubted whether any member or even any student of the Academy has studied the article.

The fact is that in dealing with painting a critic who aspires to be technical, however extensive may be his knowledge, lays himself open to being charged with incompetence. The liability arises from the peculiar secretiveness which is inseparable from the practice of the art in this country. REYNOLDS, to take one instance, might be considered as bound from his position as the recognised chief of the English school to impart all the information possible to other artists. In his "Discourses," however, there is a systematic avoidance of any allusion to the results which he had arrived at from experiments and put into practice. He made careful notes of the processes he employed in many of his pictures, but they resemble the formulæ of the alchemists; they are in a language of his own invention and could not be turned to account by any contemporary or succeeding artist. If one of REYNOLDS's assistants were to criticise a particular painting by the master on the assumption that it must have corresponded with others he had seen him producing, the President would probably be able to say that he was wronged and that the critic was not a painter. ETTY was for some time toiling in the house of Sir THOMAS LAWRENCE, but he had to own that he received little or no instruction from the portraitist. It is very doubtful whether he would have been capable of giving a correct description of LAWRENCE's methods. TURNER also ceased to work if by any chance another painter found entrance to his room. When, therefore, it is objected that a critic deals only with the ethical or literary relations of a painting, it should be remembered that few painters are uniform in their technique, and the changes in process are concealed from their friends. Who would believe that TURNER sometimes used water-colours over oil, and oil-colours over water? There are, in fact, British secrets which are as impenetrable as the ancient Venetian secret, especially in relation to the application of colours.

RUSKIN sometimes attempted to speak of colours as one painter might to another, and it is possible that in each case the artist who was noticed would maintain that he was incorrect, although the inaccuracy might be trivial. It would be easy to give numerous instances from the volume of criticisms. There is much about the relation between colour and light or shadow. RUSKIN objected to J. R. HERBERT's painting of a scene from "King Lear" because of defects in the jewels of a coronet. He says:—"Each stone has a white spot, or high light, upon it. Now, that flash is always the reflection of the highest light to which the jewel is turned, and here, in a tent, it must be of an opening in the tent on the left-hand side. Now, as the jewels are set round the brow, each in a different position, each would reflect this tent door from a different spot of its surface. This change in the position of the reflection would be one of the principal means by which nature would indicate the curve of the coronet. Now, look at the painting. Every gem has actually the high light in the same spot, on

* *Ruskin on Pictures.* A Collection of Criticisms by John Ruskin not heretofore Reprinted, and now Re-edited and Rearranged. Vol. II., Academy Notes. Notes on Prout and Hunt. (London: George Allen.)

the left-hand side, all round the brow!" Microscopic criticism of that kind could hardly come from a mere literary judge. It is the criticism of a pre-Raphaelite artist. Before a picture of the Duomo at Milan he asks:—"But why does Mr. ROBERTS always draw painted windows lighter at the top than the bottom? I have often seen them lighter at the bottom than the top; certainly, I never saw them, as in No. 418, darker at the bottom than the stone of their jambs, the whole breadth of casement telling as a gloom instead of a light." MACLISE was not one of RUSKIN's favourites, and in his notice of *Peter the Great in the Dockyard at Deptford*, he objects to it because the houses on the other side of the Thames appear with blank, square patches of grey for their doors and windows:—"When we look at real houses across the Thames, we see panes in the windows (or rags in them, as the case may be); bricks in the walls (or holes in them); planks in the doors; tiles on the roofs; incidents of all kinds in form and colour, infinitely rich and abundant; more or less confused, indeed, but this confusion is not, with us, the unfortunate plurality peculiar to distant objects. All natural objects are confused to us, however near, however distant, because all are infinite." The sarcasm is the more severe owing to the artist being singularly far-sighted. It may be said that, from their truth, the objections reveal they did not originate with a painter. It would be more correct to say they were not inspired by the conventionalism of that period.

A remark in the Notes on the Royal Academy in 1857 will be perhaps more interesting to the majority of our readers than those on the shortcomings of painters. RUSKIN exclaimed, after writing his single paragraph on the architecture and sculpture in the Academy, "But what a dark sign it is of the state of our architectural schools that there should never be seen in this room one example of sculpture applicable to external decoration or subordinated to an architectural use." If in our day the need of sculptured decoration for buildings is more widely admitted, much of the credit for the change is due to Mr. RUSKIN, who cared little for sculpture when seen apart from architecture.

RUSKIN may not have been exact in his criticisms of figure-painting, but in judging vegetation he was Rhadamanthine. EDOUARD FRÈRE by his tender sentiment captivated him more than any of his countrymen. But it was pointed out mercilessly that "his grass in no wise resembles grass; not a leaf of it is true, nor is it lovely," and that he could not draw a sheaf of wheat. Here we may give his remarks relating to a coast-scene at Blankenburg, which are applicable to a great many French landscapes:—

The French painters always chill the colours of nature as they lower them, by toning everything with grey, and thus not only alter the depth and pitch of the colour, but the colour itself. They do not merely change its key, but debase its nature—that is to say, if they have trees to lower, they turn what is in reality pale, pure green into dark, dirty green, when they ought to change it only into a darker green of the same purity. And if they have pale yellow sand to lower, instead of lowering it to a dark yellow, equally glowing, they lower it to a dark grey, and thus turn sand into slime. It is very curious that, in spite of all the talk about Titian, this simple principle of his colouring has never been understood. When Titian lowers tones, he always lowers them without changing the colours. Pale blue he translates into ultramarine, pale rose-colour into crimson, pale sand-colour into deep brown and pale green into emerald green, but he never pollutes the blue sky with blackness, nor stains pale roses with clay; whereas nearly all the French landscapes in this room represent nature seen through a smoked glass. If the sky had only been half as livid at the last eclipse of the sun as the French landscapists represent it on sunny afternoons, the birds would have gone to roost in a much more satisfactory way than I hear they did.

This may be literary criticism, but many lectures have been delivered by Royal Academicians which have far less definiteness and are less applicable to the needs of young painters. He may have been wrong in adopting nature as a standard instead of an academical code, and in testing pictures by their fidelity to what can be seen before our eyes. But so long as it remains undetermined how far a different standard is to be the criterion, we must at least admit that RUSKIN had logic on his side.

Among all the exhibitions RUSKIN was most at home

in the room of the Water-Colour Society. "What a simple company of connoisseurs we were," he says, "who crowded into happy meeting on the first Mondays in Mays of long ago, and discussed with holiday gaiety the unimposing merits of the favourites from whose pencils we knew precisely what to expect." That was in the forties and early fifties; for in 1859 he had to confess, "I cannot enter with any pleasure into examination of the works of the two water-colour societies." Both were then, he believed, in steady descent, ruined by the endeavour to rival oil-paints and display facility. Or, as he put the change in a few words, "the sponge and handkerchief have spoiled water-colour painting." None of the pages are therefore more satisfactory than the Notes on PROUT and HUNT. He records how PROUT lived in Brixton, where the parish church enabled him to prize Strasburg Cathedral and the Hôtel de Ville of Brussels, while HUNT was only properly at home in the Hampstead Road. He acknowledges that HUNT's choice of subject was sometimes plebeian—not to say vulgar. But there were no drawings produced in modern times which were considered to be at once so sincere and so accomplished. PROUT's influence on RUSKIN cannot easily be measured. It caused him to give a preference to ruggedness in architecture, meaning also open joints in masonry. The confession, "I had almost rather see Furness or Fountains Abbey strewn in grass-grown heaps by their brook-sides than in the first glow and close setting of their fresh-hewn sandstone," is by itself sufficient to explain why he was dissatisfied with modern building.

It would be easy to point to much else in the book which is so inseparable from JOHN RUSKIN as to become almost biographical. The interest in the pages is of many kinds. Why the author did not comprise the "Notes" in the new and more popular edition of his works is not stated; he may have undervalued them, but if they were only to be found in their original states, to be hoarded by collectors, it would be a loss to the literature of art. In his criticisms Mr. RUSKIN was endeavouring to show how the question, "What's in the Academy?" put each year to those who attend private views, could be answered. He brought his principles into application; the wise saws and modern instances were combined. In some cases the pictures which were selected for admiration are forgotten, it may be unjustly, but in others RUSKIN's remarks have been endorsed. Apart from their immediate effect, the "Notes" are a revelation of RUSKIN himself, and for those who have no time for a systematic study of his numerous volumes they will form an excellent companion to the "Selections" and the "Notes on TURNER." They have been produced most carefully by Mr. E. T. COOK, who has added whatever information is required to enable the present generation to understand the circumstances under which the criticisms were produced, and an index which is exhaustive. There are also nine admirable plates.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER IV. (continued.)

ALTHOUGH perhaps not strictly within the province of this treatise, it will not be amiss to criticise at this place the contention that the Greeks translated into stone the original timber construction of dwellings. The arguments are very ingenious, and it would be rash to assert dogmatically that the origin was or was not due to timber prototypes. But, remembering that the Greeks were so artistic and generally truthful in their art (whatever they may have been in other matters), it is curious that they should on all four faces have used triglyphs, if these are supposed to represent joist ends, as such construction with joists would not be feasible.

Again, the use of mutules and dentils below a pediment is similarly unjustifiable on the hypothesis that they represent respectively Principal and Common rafters. Their introduction would be legitimate in the absence of a pediment, for with a hipped roof (in conjunction with which a pediment should not be used) these rafters are

used constructively on contiguous return faces. The origin of guttæ is variously ascribed. On the supposition that they represent rain drops, their introduction on all faces is perfectly legitimate; but on the hypothesis that they represent pins or fastenings for the timbers, their use should be restricted to the same extent as the use of triglyphs, &c., &c. VITRUVIUS has some remarks to make in this connection, which are of interest, and are to be found in Book IV., Chapter 2.

A few remarks may be devoted to Chiaroscuro, as its influence in producing a pleasing result should not be neglected. For the benefit of those who are ignorant of the meaning and derivation of this word, it may be stated that it is of Italian parentage, and refers to the play of light and shade (*Chiaro*=clear, *oscuro*=obscure). Sciography is not much studied in England, nor perhaps is it necessary, but the general effects of light, shade and projections should be known to all. Care should be exercised that light and shade are effectively regulated and controlled. Also the treatment of ornament or of ornamental features should follow on similar lines: delicate ornament would be most inappropriate in positions set in deep shadows or in high lights; half tones will form its best medium. Where there is strong sunlight there should be provided bold projections, not merely in positions where their provision will give welcome shelter from the heat or annoyance of the sun's rays, but also so as to cast shadows where they will be aesthetically approved. The boldly projecting cornices of Florentine Renaissance buildings are well worthy of imitation or adaptation. Porches, balconies and balconettes, detached columns, &c., all help to heighten the effect of buildings, if properly introduced. It must be remembered that in England the sun is more grudging in display than he is in some happier climes, such as Spain, Italy and elsewhere, where there are broad surfaces of sunlit wall alternating with deep patches of restful gloom. In the most general terms it is to be understood that, on the whole, the sun is to be countenanced in England, instead of being hustled out of the way.

In the undercutting of ornament, too, there is great scope for the display of chiaroscuro, but the claims of contrast and variety must be remembered throughout. Generally speaking, strong contrast and vivid chiaroscuro should be utilised in direct ratio of distance from the eye. Where there are different points of view, the most important should be the first considered: of two equally important standpoints, the one nearer the object should receive prior consideration.

Projections, as above indicated, are important factors in the display of chiaroscuro, but their employment is of

not of such extreme rigour as to preclude the use of projections to a greater or less extent. The house shown in fig. 24 has an elevation that may serve all useful (that is practical) purposes, but it cannot be considered in the slightest degree ornamental. Certainly it satisfies (or at least does not militate against) various principles of design, such as expression, emphasis of plan, economy and balance, but it fails in perspective effects, proportion and individuality, and this constitutes a bad failure.

It may be granted for the immediate purpose that a reasonable mean has to be preserved between *carte blanche* and close-drawn purse-strings in the matter of expenditure. Taking the elevation last shown as a basis, it may be well to consider how possible developments may be effected. A low plinth may be introduced and the eaves may be supported on projecting courses of stone or brick; a string-course may be effectively used to emphasise separate storeys. Segmental, square or canted bays are not very expensive features. The elevation subjected to these improvements would appear very much as shown in fig. 25.

Development of previous Façade.

FIG. 25.

It may be urged here by an architectural Fadladeen that this elevation is of a very ordinary "jerry" type, but the criticism would be more severe in intention than valid in

A severely practical Elevation.

FIG. 24.

value for other purposes also, as they impart a corresponding degree of variety into the elevations. Monotony is a foe that should be strenuously fought and overcome, though there are numerous occasions when financial considerations are necessarily given prior place. Under average conditions, however, the question of economy is

Coursed Quoins.

FIG. 26.

effect. The "jerry" type of building implies that a badly-built house is made more or less attractive externally on the

principle inculcated in that charming poem of "The Spider and the Fly." In passing along a street when a range of buildings—terrace or semi-detached—is noted of one general type of elevation, it is expected that the passer-by will immediately label the collection as jerry-built, not on account of the design, but from an intuitive deduction of probabilities; this, however, is *en parenthèse*. To revert to the elevation which was left in process of improvement. The façade can be made more attractive by the use of projecting quoins, either *en masse* or coursed, as shown in fig. 26. A more pleasing treatment of the eaves would be to let the rafter ends show beneath the gutter (instead of being hidden), or else have a series of brackets (see fig. 27) at *a* and *b* respectively.

FIG. 27.

Centrally the eaves might be broken by providing a gablet, or if attics are required, then dormers can be introduced very effectively. As an embodiment of most of these suggested methods of ameliorating an elementary façade

Previous Façade more fully developed.

FIG. 28.

The elevation shown in fig. 28 is most decidedly an improvement on that shown in fig. 24; nor can the latter illustration be styled extravagant in any way. These are simple examples of projections, and only touch the fringe of the

Various Plans of Windows.

FIG. 29.—PLANS OF VARIOUS SHAPED WINDOWS.

for ornamental purposes, and they are capable of very varied treatment. In fig. 29 are given some of the numerous shapes they may be made to assume. Of these, *a*, *b*, *c* and *d* admit of very favourable adaptations; *f* and *g* can be made highly agreeable features, both externally and internally, whilst *e*, *h* and *j* should be condemned by all right-minded folk. The latter shapes are not often met with, fortunately; and even in regard to *f* and *g* a word of caution is due, as it is right to remember that windows at angles tend to give an air of constructive weakness to a building which, though not perhaps justified in fact, is to be deprecated, even if not more than a semblance. Variations on the above forms are possible in many ways, as, for example, the use of oriels in place of continuous bays (see fig. 30 at *a*), or the superposition of one shaped bay over another, such as canted over square (*b*), or square over canted (*c*). The varied effect, too,

Variations & Combinations of Window Outlines

FIG. 30.

on a design, of a one-storeyed or of a multiplied bay is to be borne in mind. A pleasing mode of treatment for the purpose of producing variety is the inset projection; it may sound somewhat contradictory in terms, but this is the effect left on the spectator. This treatment (illustrated in

Inset (or Sunk Bay) Window.

N.B. Sunk into the Room.

FIG. 31.

fig. 31) has been growing in favour of recent years, and has much to recommend it.

Other very effective features in an elevation are balconies, balconettes, verandahs and loggias. Definitions of these terms are at times inconclusive, but the following will best explain them severally (see fig. 32).

A balcony is a landing outside a window, being railed in or balustraded so as to adapt it for use.

A balconette is a balcony front set against a wall merely for adornment.

A verandah is a continuous balcony roofed over.

A loggia is a covered way open in front, and is set back from the face of the wall instead of projecting as a balcony or verandah. To dispose of the *balconette*, in the first place, it may be remarked that it gives an air of freedom from restraint that is sufficiently pleasing; but lacking any utility (or perhaps it should be utilitarianism), it is apt to convey an impression of unreality.

The *balcony*, from the point of view of adaptability to use and ornament, is a welcome feature; care should be exercised that in introducing it it is not only made constructively strong, but is also given the appearance of adequate strength. It may not be out of place to warn against the use of what "Mr. PUNCH" designates as "them handy little balcō-nies"—handy, that is, from the house-breaker's standpoint. Suburbia is often inclined to riot in the use of balconies placed within easy reach from the ground level, and too often inviting their escalade by the brethren of the Appropriation League. It is very different when the balcony is at such a height from the ground as to confine the approach to it from within the house. As regards its ornamental treatment the possibilities are extensive, but it would be out of place here to do more than remark that the design should follow on the lines of the

subject. Though projecting windows have a value for practical purposes, namely, increased light and space, aspect and prospect, yet their main value is undoubtedly

whole elevation, as anything like patchwork ornament is offensive.

Verandahs do not call for detailed mention, but in regard to *loggias* it should be noted that their use should not be tolerated where the rooms in their immediate rear are inadequately lighted.

FIG. 32.

Turrets were first employed in the service of staircases, and are appropriate features for similar purposes at the present day. Their use in conjunction with batement windows emphasises most notably this important feature in a building, and they help to break up the surface of a façade in an entirely pleasing and justifiable manner when so used.

Porches, too, whether projecting or set in, are valuable aids to successful design; they are dealt with in greater detail later in this work. In public buildings it would seem too often to be considered essential, when the Classic style is used, to introduce colonnades, stylobates, pediments and other features for the reproduction externally of the appearance of a Grecian or a Roman temple, seemingly oblivious of the fact that the nature of the edifice may (probably must) call for very different treatment. Colonnades and arcades, valuable where strong sunshine and a clear atmosphere alternating with seasons of heavy rainfall are present, are *mal à propos* for the most part in a country such as the United Kingdom. But the root of the evil does not exist in the use of one "style" or another, but more in the mania for reproducing old forms for their own sake, instead of adapting them on logical lines. Occasions arise, however, when colonnades and arcades may be judiciously and effectively used, as, for example, in the Royal Exchange, London, though its *raison d'être* is now destroyed by the roofing-in of the nave.

The varieties of projections are too numerous to justify any attempt in this work to notice them individually in any detail. It will suffice to mention such varieties as *flèches*, buttresses (often merely ornamental), pinnacles, piers, pilasters, attached and detached columns, cornices, rusticated window and door-dressings, and a long list of etcetera. Some of these will be considered later, in the chapter dealing with ornament.

(To be continued.)

SPIRALITY.*

AMONG the books in general literature which have appeared this season we doubt if there is one which will be so interesting to architects and other designers as the volume on spirals by Mr. T. A. Cook. For it raises the important question whether man was indebted to natural forms for inspiration, not only in architecture, but when designing ornament. His own imagination would then be of little importance. On such a subject naturalists take the affirmative side. They point, for example, to the employment of the lotus in Egyptian architecture as conclusive evidence. But they do not seem to realise that although the plant was utilised for decorative purposes, there is no affinity between the massive columns and the slight and fragile lotus. Even if we suppose the column is suggestive of bundles of the plant, there are still differences of character which cannot be surmounted. In the same way a host of writers have described Gothic architecture as no more than a copy in stone of the alleys seen in pine woods. It would appear that one class of students of science are prevented from studying architecture because the indebtedness to nature is not gratefully acknowledged. Thus we have Professor RAY LANKESTER declaring:—"I feel that architecture, if it is to appeal to all of us, as it should do, must, in the end, be based upon some general morphological principles. I have long looked in vain for any architectural handbook that would not merely suggest the foundations on which building and ornament finally rest, but would also lucidly explain to the untechnical observer the reasons, the faults or the virtues of any architectural example with which he might be brought in contact." It would be easy to attain that end if we were to take for granted that architectural forms were in all cases derived from nature. But so far as the history of the art supplies us with information a contrary conclusion should be arrived at.

In the first place, there can be no question that architecture was well established before there was any close study of natural forms. The Corinthian capital, in which the acanthus leaf has been adapted rather than imitated, seems to have been the latest variety of the orders employed by the Greeks. RUSKIN'S indifference to Greek architecture was mainly caused by the absence of such imitations of nature as are to be recognised in Gothic art. We may allow, if necessary, that Greek architecture would have gained if nature had been drawn upon more liberally. But it is now too late to blame the architects for obeying rules of art which were then accepted.

It does not follow that because they were chary of going to vegetation for principles they were oblivious of the spiral. It undoubtedly appears in many ancient examples. But it should not be forgotten that the spiral, taking the word in a generic sense, is very easily created. We may not believe with SEMPER that architecture and decoration are the outcome of needlework or weaving. It was impossible, however, to twist two coarse threads, or even two thin branches of a tree, without forming a perfect spiral of one kind. Interlaced bands were a very easy production. Undulating lines are common on Greek vases, and, indeed, a large variety of spirals could be extracted from Greek as well as from Eastern and Egyptian art. We do not wish to suggest that in all cases they were independent of natural forms. The wave pattern may have been derived from the sea, and some ornamental bands became also reminiscent of creeping plants. But it is more probable they were the issue of geometrical exercises. The number of explanations which have been brought forward in order to account for the origin of the volutes in the Ionic capital is almost sufficient to show how general is the belief that man could be independent of nature in evolving architectural forms. There is, of course, high authority for the belief that "nature is made better by no mean, but nature makes that mean," and in that way, when man creates, the credit is to-

* *Spirals in Nature and Art.* A study of spiral formation based on the manuscripts of Leonardo da Vinci, with special reference to the architecture of the open staircase at Blois, in Touraine, now for the first time shown to be from his designs. By Theodore Andrea Cook, M.A., F.S.A., with a preface by Professor E. Ray Lankester, F.R.S., director of the British Museum of Natural History. (London: John Murray.)

be given to nature that endowed him with the requisite powers.

In the course of time, when more attention was paid to nature in its manifold forms, the prevalence of the spiral could not remain unnoticed. There are enough Renaissance examples to suggest that it was then employed more often than either in Mediæval or Classic periods. We can see representations of helmets, for instance, which must have been derived from ram's horns. In early etchings men are represented with hair and beards as elaborately curled as those of an Assyrian official or one of the guardian bulls. LEONARDO DA VINCI was from time to time fascinated by the form. The seal or mark of his Academy at Milan presents his name surrounded by a series of spirals of which it is difficult to trace the beginning or end. On other occasions he amused himself by allowing his pen to wander in the formation of the most elaborate convolutions. There are grounds enough to justify Mr. Cook in writing a volume to explain, if possible, the power which the form must have exercised over the great artist's mind. He may have imagined that the complicated series which seem to form knots that could never be untied were adapted to be taken as a presentment or symbol of his own tangled life. The straight line, which is the shortest distance between two points, was most unlike what DA VINCI had to pass through, for in everything he did he was unable to come to the end he aimed at directly, but only by a roundabout course, one spiral being, as it were, transformed perpetually into another. His own epitaph suggests that he believed he had never carried out the purpose of his life, and he appealed for the forgiveness of posterity:—

Mirator veterum discipulusque memor,
Defuit una mihi symmetria prisca; peregi
Quod potui. Veniam da mihi, posteritas!

DA VINCI was engaged by FRANCIS I. not merely as a painter but as an architect and engineer. Mr. COOK says that at Blois there is a staircase "built just at a time when LEONARDO'S presence in Touraine might have enabled him to suggest its plan, built with its external lines corresponding to the outside of a shell, while its internal spiral reproduces the helix on the columella of that shell." This is the staircase in the Château de Blois, which is always viewed with delight by architects, and who, regardless of photography, are often pleased to sketch it with the hope of exploring the mysteries of its construction. In our second volume we published a very elaborate drawing of the interior, by Mr. WATERHOUSE, R.A. It would no doubt have been easy for DA VINCI to have taken a suggestion from the *Voluta Vespertilio* for a winding staircase, just as JAMES WATT imitated the tail of a lobster when laying a conduit with flexible joints beneath the Clyde at Glasgow. The Blois staircase is, however, more likely to have been evolved from examples which were to be observed in many a donjon in France. Staircases were sometimes constructed within the thickness of the walls, and the more turnings to be found in them the more satisfactory they became in a military sense, for they were easily defended. Mr. COOK says:—"The designer of this staircase had not merely a quadruple mathematical line in his mind; he was thinking of a shell, and he was not thinking of *Cymbium*, a shell which has four plaits on its columella, but of *Voluta Vespertilio*, which hides its quadruple helix behind an arrangement of sloping lines growing above slender columns, exactly as these sloping balustrades are built." The supposition is ingenious. But in those days we imagine very few architects could have examined the inside of *Voluta Vespertilio*. Mr. COOK believes that RUSKIN, who counselled his pupils to avoid shells in ornament, had never looked inside them. If that was the case with an ardent student of nature in the nineteenth century, there was less likelihood of sections of shells being investigated at the beginning of the sixteenth century. Why should not the spiral tendency, which is so marked in vegetation, be allowed to become one of the powers in art? Nature does not do her work by short cuts or leaps and bounds, unless when destruction is necessary. The stone-cutting at Blois is no wonderful feat to a student of Gothic architecture. He finds in it only a development of the earlier work in ecclesiastical and military buildings. That it happens to

correspond with nature's principles of construction, as seen in shells, enhances the value of the masonry. Men might have earlier attained success in construction if they had studied conchology; but we must take the world as it is, and overlook a fearful waste of time in arriving at inventions. Mr. COOK's book furnishes new arguments for the study of natural history by men who are engaged in construction, and he has revealed another side of DA VINCI's extraordinary versatility. We may not agree with him in acknowledging indebtedness to natural forms for the spiral and its applications. But we must admire his enthusiasm in following out the ramifications of his subject and for demonstrating a closer relation between art and science.

THE GREATER CORK INTERNATIONAL EXHIBITION, 1903.

THE prospectus of the Greater Cork Exhibition, 1903, the object of which, like the successful exhibition of last year, is to promote the industrial resources of Ireland, has been issued. Since the close of the last exhibition it is stated that acknowledgments have come from far and near of the enormous educational benefits which it has conferred on those who visited it, and of the stimulus which it has given to the trade of the manufacturers and others whose machinery and products were exhibited. In view of this remarkable success, the committee of the exhibition feel that the educational process so happily begun ought not to terminate in so short a period as a few months, but that, on the contrary, it ought to be extended and continued, and they have therefore determined to reopen the exhibition in the summer of 1903. This decision has met with the warm approval of commercial men of all classes, and His Excellency the Earl of Dudley has shown his appreciation of the scheme by becoming its patron, and forwarding the generous contribution of 250*l.* towards the expenses of providing additional attractions for this year's exhibition. Whilst the scope of the exhibition will not be in the slightest degree limited, it is the intention of the committee to make Irish manufactures and industries one of its prominent features, and to devote special sections to the display of the products, raw and manufactured, of the country. The exhibition will be opened early in the summer, and will continue open for six months. It is not intended to issue any awards.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT a meeting of the Edinburgh Architectural Association, held in the Association Rooms, 117 George Street, Edinburgh, on the 21st inst., Mr. A. Hunter Crawford, the president, in the chair, Mr. J. A. Gotch, F.S.A., F.R.I.B.A., Kettering, delivered a lecture on "The Homes of Queen Elizabeth's Courtiers." In the time of Elizabeth, he said, there was a prevalent desire for better homes, partly arising from what people saw abroad and partly arising from an increased desire for comfort, and the presence of considerable wealth derived from the dissolved monasteries. These causes led to an extraordinary amount of building in the sixteenth century, and probably every village in England had some remains of work done in the time of Elizabeth or James. The characteristics of the architecture of the period were largely influenced by what people had seen abroad, and especially in Italy. It was the Italian influence which characterised the work of this time, and the peculiarity of Elizabethan architecture was that English workmen adopted Italian ideas in buildings which really had a Gothic ancestry. The essence of a house was in its plan, and the planning of Elizabethan houses was a matter of great interest. They provided for the increased wants of the time, but they did it, as a rule, in a stately manner and in a manner that was very much influenced by symmetry. In fact, to this quality of symmetry a good deal of what they at present should consider comfort was sacrificed. Another peculiarity of the time was quaintness in design. This quaintness sometimes even affected the plan itself, as in the case of the Triangular Lodge at Rushton, which embodied the idea of the Trinity, and the new building at Lyveden, which embodied the idea of the Passion. There was also a plan extant of a house designed by John Thorpe in the shape of his initials, J. T. The lecturer described the general arrangements of Elizabethan houses, and the methods of design, pointing out that a design was not produced by a single architect as in the present day, but by a number of designers in various trades working in harmony, and proceeded to deal with the external appearance of the houses, their surroundings, their internal appearance, and the treatment of the interior in the various departments of walls, ceilings, staircases, &c. The lecture was illustrated by a number of limelight views.

NOTES AND COMMENTS.

M. EMMANUEL FRÉMIET is a native of Paris, where he was born in 1824. He studied with RUDE. He can claim to have witnessed, if he did not assist in, the revolution of 1830. In his early days his skill as a painter enabled him to obtain employment as an official of the Morgue. His duties were certainly not pleasant, for the principal employment of his pencil was to touch up the bodies which had been drawn from the Seine in order to conceal the stains or bruises, so that they might be more presentable on exhibition to the public. There is a good deal of the *gamin de Paris* in such a work as the *Dénicheur d'Oursons*, which is in the Luxembourg, and represents a juvenile PAN endeavouring to obtain honey from a hive for two young bears. All visitors to Paris know his *Jeanne d'Arc*, which is seen in the Place des Pyramides, and which is the most popular representation of the warrior girl. His *Man of the Stone Age* is in the Jardin des Plantes. There are many animal figures by him, and no one who has gazed on one of his gorilla subjects is ever likely to forget it.

THE decision to remove St. Mark's Library from the hall of the Great Council in the Ducal Palace of Venice to the Zecca, or mint, is an event in an historical sense, and may be regarded as proof of misgiving about the safety of the Palace of the Doges. No books and manuscripts have had more magnificent surroundings. But the great paintings and the sculpture make the collections appear rather unimportant in the eyes of the ordinary visitor. The origin of the library must be ascribed to PETRARCH, the poet, for in return for the hospitality he received in Venice during a plague he presented a number of manuscripts. But the most munificent of the early benefactors was BESSARION, the Patriarch of Constantinople, who in 1468 sent a number of Greek manuscripts copied by himself in his early days, as well as all he could collect when he attained power. During three centuries many collectors imitated, as far as they could, the example of BESSARION, and, in consequence, over 5,000 manuscripts and 65,000 volumes were obtained. Among the manuscripts is a Book of the Gospels about 1,000 years old, a copy of Lombard laws, a part of DANTE'S poems, a fifteenth-century work by RIDEO, with 332 drawings of plants by AMADIO; the manuscripts of CELINI'S treatises on goldsmiths' work and sculpture, &c. Some of the greatest Venetians have acted as librarians, among them being men who afterwards became Doges. The Zecca, to which the collection will be removed, is one of SANSOVINO'S works, and fortunately remains in a sound state. There will be more accommodation for the collections, and although the removal may break a historic chain, it will be an advantage for those who hereafter may have to consult the books and manuscripts.

THE Court of Appeal has given a judgment which we hope will have the effect of preventing allegations of collusion between architects and their clients from being uttered rashly. The plaintiff in the case in question, Mr. CHARLES HOPE, is a builder who sought to recover the balance of an account under a building contract from Mr. E. S. EARDLEY. The plaintiff was not armed with the architect's certificate, which is omnipotent in such claims, and in order to account for its absence he asserted there was collusion between the defendant and Mr. VICTOR SCRUTON, the architect whose plans were to be carried out. At Birmingham the judge, after hearing the opening, suggested that the case should go before the Official Referee as it was merely a matter of account. The defendant, however, appealed on the ground that as he was charged with collusion and fraud he was entitled to a trial before a jury. In the Court of Appeal it was suggested that the plaintiff should withdraw his allegation, when the judge's order could be respected, but his counsel declined. Thereupon the Court allowed the appeal. Lord Justice ROMER said there was a charge of serious misconduct, not to say fraud, on the part of the defendant, because it suggested a want of good faith on his part—in fact, moral fraud. In his lordship's opinion this was a kind of question that the defendant had a right to ask the opinion of a jury upon, so that they might decide it. The appeal would be allowed, but the costs of that appeal and of the first hearing would be left to be decided by the

judge at the next hearing of the action. Lord Justice MATHEW concurred. We cannot, of course, offer any remarks on a case which is before the courts, but it is at least allowable to suggest to future claimants that collusion is always difficult to prove, and a litigant should regard it as a precarious support.

IT is not in London alone the necessity arises for closing churches. A commission was lately appointed in Liverpool to inquire into the subject of church accommodation, and as a result it is recommended that no less than six churches should be removed, and two others sold, in order to obtain funds for the erection of more suitable buildings. The churches proposed to be removed are All Souls, in Eton Street, Vauxhall Road—a modern church, for it was commenced in 1854; Christ Church, Hunter Street, which dates from 1797; St. Mark's, Upper Duke Street, erected in 1803; St. Paul's, in 1769; St. Thomas's, Park Lane, in 1750, and St. Titus's, Portland Street, which was built in 1864. It cannot be said that any of them are remarkable as works of architecture, although some of them cost from 15,000*l.* to 18,000*l.* The principal reason for the removal is that the successors of the congregations which used to worship in the buildings have found residences in other districts. It is proposed by the commission that the proceeds of the sale of the churches and sites shall, after providing for the wants of the parishioners, be carried to a common fund for the erection of churches in other districts of Liverpool.

THE notice to artists respecting the Royal Academy exhibition of this year has been issued. The days fixed for the reception of works are as follows:—Water-colours, miniatures, black and white drawings, engravings, etchings, architectural drawings and all other works under glass, Friday, March 27; oil-paintings, Saturday, March 28, and Monday, March 30; sculpture, Tuesday, March 31. Forms and labels can be procured as usual during the month of March. There is only one slight change in the regulations. It used to be said, "Low reliefs should be framed;" now the rule is, "Reliefs should be framed." No more than eight works will be allowed from any artist. All pictures and drawings must be in gilt frames, but excessive breadth in frames and margins, or projecting mouldings, may prevent pictures or drawings obtaining the situation they otherwise merit.

CATHEDRAL SERIES: WORCESTER.—THE NAVE.

INCH HOUSE, BATHGATE: NORTH-WEST FRONT, SOUTH-EAST FRONT.

TOWN HALL, COLCHESTER: SIDE OF GREAT HALL FROM STAGE.

THE COURT ROOM, BREWERS' HALL, ADDLE STREET, &c.

BREWING is in our time so important an industry, and the leading representatives of it are so prominent, some may be surprised to learn that the Company of Brewers ranks low among those of London. It is true that the Company was incorporated as far back as the sixteenth year of the reign of HENRY VI., but the operation could be performed in any household. It was recognised as an occupation for women. Indeed, for a long time in England the apprehension of the danger from fire was an obstacle to brewing on even a moderate scale, and, according to Dr. HENRY, shopkeepers were compelled to pay for permission. Not until 1643 was beer made an excisable article in England, and Scotland was exempted until 1695. For several years German beer was imported, but the duty of 15*s.* a barrel which was levied in the time of Queen ANNE was a check on the supply. In the same reign a fine of 50*l.* was imposed on any brewer who lent his utensils. It is remarkable, however, that in 1731 GONZALES, who is thought to have been DANIEL DEFOE, hesitated about recognising brewing and distilling among the London industries, although it was said the various kinds of beer were not to be paralleled elsewhere in the world for quantity or quality.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

The following were elected as members:—Messrs. G. P. Bowie, H. W. Sefton, E. J. Walters, Herbert Read and R. F. MacDonald.

The HON. SECRETARY announced that the first spring visit was fixed for Saturday, February 7, when members on producing their passes would be allowed on the works of the Victoria and Albert Museum, Kensington, by kind permission of the architect, Mr. Aston Webb, A.R.A.

Mr. J. D. FORSYTH read the following paper:—

The Attitude of the Architect towards the Crafts.

The question we so often omit to put to ourselves by reason of the familiarity of the term "crafts" is, What is the real meaning of the word, and how many of the applied arts are included in it? We may, I think, safely say sculpture, decorative painting, stained glass, mosaics, pottery, carving, plaster-work, enamels, textiles, wrought-ironwork, furniture and, though perhaps not strictly connected with architecture, printing and bookbinding. These are all generally accepted and embodied in the term.

But, in my opinion, the word "craft" is an unfortunate one, inasmuch as it seems so difficult to dissociate its station and consequence from the word "art." A happier term for any of these crafts would be perhaps "applied art," for they all are undoubtedly "art" when conforming to the true principles of decoration, and possessing the qualities of sound technique and beauty of design. It may seem unnecessary to emphasise the point, but all the crafts I have mentioned, with the exception of the last two, printing and bookbinding, are distinctly "applied." I mean they are in direct relationship to the building they adorn—are, in fact, part and parcel of its conception and completion. The fact is constantly forgotten that architecture is the mother of the applied arts, the parent from whom they spring, and not the stalking-horse on which the so-called "decorator" may hang his wares.

The variety and complexity of these applied arts has naturally led to the evolution of the so-called "craftsman." In other words, the producer of these various arts is at the same time a designer and worker. He is therefore differentiated from the architect who, in the multitude of his duties, cannot be a worker in the same sense that a craftsman can. He may take lessons in modelling, and therefore be the better able to direct and control the sculpture he employs on his building, but he does not and cannot take the place of the craftsman.

One mind should dominate every building—I mean the educated eye should be able to discern that the same master mind has subordinated every part, be it large or small, to make up the perfect and complete building. But the actual means of compassing this end is complicated by the fact that it is a physical impossibility for every architect—indeed, for almost any architect—to gain sufficient knowledge of all the varied materials at his disposal to enable him to design in them with that grasp which the craftsman must have. It seems, therefore, that while the architect must know the limitations of the various materials he employs, and must have a general knowledge of the methods of the craftsman in that material, he must perforce leave the actual expression to the craftsman himself.

The multiplicity and variety of materials now at the disposal of both designer and manufacturer seem to invite their free use, and many excuses are found for their adaptation. A supposed opportunity is found for the use of this or that material. The cheapness of its production will permit of a space being decorated which otherwise would have remained bare. The character and style of such decoration is too often misapplied, and instead of securing a refined and pure adornment to that space it is rendered tawdry and incongruous. It would have been much richer in its bareness. Such results strike a harsh note; they disturb the harmony of refined work, and vex the soul of the conscientious student who by his training and gifts knows that if such work and money had been expended with proper direction and knowledge, a far better result could have been obtained. They must surely also exert a harmful influence upon the good judgment and taste of the public, which, ignorant as it is, mistakes elaboration for beauty and misapplied decoration for art. It should be the aim of all of us to eliminate this misapplication, to bring architect and craftsman into more complete harmony, so that each may realise that under the stress of modern conditions each must work conjointly with the other, never forgetting that the part must in all cases be subordinated to the whole. We must "piece out these imperfections in our minds," or to use a less classic quotation, and put it into the words of, say, a foreman mason, we must endeavour to give each crudity "its back day."

Let us briefly review the province of the architect. The study and practice of architecture in this twentieth century may without any hesitation be said to be one of the most intricate and difficult of professions, added to which there is that indefi-

nite, indefinable something, be it ever so simple, which distinguishes architecture from mere building.

There are so many different branches of study, so many different and new materials to gain a knowledge of, so much to be learnt from both past and present, that the architect is really a student all his life. The architect's part in the decoration of a building is a large one, for he must, in my opinion, be able to direct the subjects and their general proportions and styles. He must be able in designing his building to introduce the various arts for its adornment in places where their introduction will materially assist it, supposing such ornament is not merely the enriching of constructional features, such as the way in which sculpture is often employed, but is only to emphasise the meaning and purpose of the building.

The value of an imposing group of sculpture, the use of other carving, the colour schemes and the kind of materials for their production, the value and use of frescoes and the styles and subjects of them, the treatment of glass, must all be under his direction, and he should know how each is to be treated and made one with the architecture of his building. The architect will know that in introducing his group of sculpture the elevation of his building can be either very materially enriched or ruined. He will therefore direct the exact scale of figure, a certain line in its composition, and the breadth of treatment necessary for its value. The sculpture becomes part and parcel of the architecture, and for that purpose must be architecturally treated; it must have no appearance of being foreign to the general scheme, or as if something just modelled and placed there irrespective of architectural proportions. Therefore the architect alone can know what is best required upon these lines for the adornment of his building. These conditions similarly apply to most of the decorative art, which must be considered architectural adornments. In mosaics and painted panels, frescoes and other features, utility, style, scale, line and the proportions of general massing of colour and subject are the fundamental points to be studied, and the direction of them must come within the province of the architect. He should convey his ideas of them to the decorator by means of rough sketches.

Given that an existing building requires decorating, if that building is of considerable consequence because of its purity and refinement of style, and the architect who produced it was a famous man, it should be an architect's province to direct the character and style of the necessary decoration, because only an architect who has made that style his especial study, and whose experience in construction enables him to appreciate and follow the beautiful characteristics in that style, and who has paid particular attention and studied the individuality of that famous man, can be competent to know the best decorations for it. Even then there is danger in touching the building.

Let us now glance over the province of the decorator, and under that name I include the sculptor and painter and all other workers in the applied arts. Like architecture, decoration covers a very wide field; a field which should have a boundary line marked by an architectural wall to prevent decorators straying from within its precincts into unknown spheres. The decorator usually commences his career by serving a term of years at a special craft in which he obtains a thorough technical grounding. As a sculptor he becomes an expert in modelling and carving, and is able to execute commissions for figures in various materials including bronze. His province in this art allows him considerable scope and freedom, but in carrying out his commission too much freedom cannot be allowed, for he would doubtless be running amok with the architect for whom the figures are being carried out. He will receive general instructions as to scale, breadth of treatment and other views of the architect, all of which are necessary to render his work strictly architectural and to be in harmony with the building. It is the decorator's province to execute the commission on these lines. Experience and efficiency in his own particular material aid him in actually producing the work, and here the architect will not presume to direct. The decorator—if he be a painter—will receive similar directions from the architect, and to him are allotted conditions comprising subject, scale and general scheme of colouring. It is not his province to choose these, because he cannot possess another man's individuality, and cannot, therefore, be competent to know the character and style for the decoration such as were originally intended by the architect. In a case where, given a free hand to decorate a Renaissance building, good or bad as it might be, the decorator is very apt, for many reasons, to go wrong. It may happen that his experiences as a painter of architectural decorations have been mainly confined to the Gothic school, and, no matter how skilful he might be as a draughtsman or colourist, the influence of the Gothic is bound to make itself manifest in his work, and even the rudiments of subject, scale and general scheme of colouring in a Renaissance decoration will not be grasped by him, and a poor scheme will result unless he independently seeks the advice of a competent architect. The

painter may be a man who prefers to ignore character and style, and go for something which is quite the outcome of his own invention and fanciful ideas. Then, provided the building he is to decorate be one which glories in the beauties of a pure order, and as such is a representative example, the result of his labour is deplorable and the building spoilt. The decorator here who is inexperienced in architecture, as is so often the case, will do many foolish things, and unwittingly quite disregard obvious conditions existing in the main and various details in the construction of the building.

Invention of style and fanciful ideas of colour and material cannot lend themselves to be in perfect harmony with this beautiful building. Some of the most delicate features in its architecture, characteristic mouldings, valuable flat surfaces—which were probably never intended to receive much if any colour—will all come in for their share of his paint-brush, or be chiselled away to receive some incongruous and foreign material. A free hand in a case of this kind should not come within the province of the decorator, even though his knowledge of, and respect for, architecture be recognised as experienced. An architect should supervise, but only the united and harmonious endeavours of both will produce true results.

Let us now review examples where the architect collaborates with the decorator. The one who has conceived the main and grand construction confers with the other, from whom is required the actual production of his art for its adornment.

Let me then firstly deal with sculpture, for I consider that art, when applied to architecture, the most difficult to treat. For example, a commission for a group of figures upon a pediment is placed with the sculptor by the architect for execution. The architect will, in conferring with the sculptor, show him the elevation of the building it is proposed to adorn, direct the dimensions and scale of the group, and give the subject for it; and together they will discuss points on treatment in technique and manner of style, and cost. Having clearly understood the views of the architect, and having grasped the necessary architectural requirements, the sculptor proceeds to make rough sketches, to about 1-inch scale, for the composition of his group, which he is often pleased to do in various materials. He may elect at first to sketch in different media upon paper the general lines of his group, or he may—as in my opinion he should—commence right away with a small scale sketch in clay or wax. In this group the most important point which will tax the sculptor's skill is that of composition, and in that particular alone he will find it necessary to make and experiment with many rough sketches for his group of figures. These rough sketches are made to arrive at correct positions and pose of the figures, and they are put in in a very broad manner. In them detail is not considered. The sculptor is mindful of the fact that the group is to adorn a pediment, an architectural feature in the elevation which will require his every consideration. It might be a great distance from the ground, and have much or little projection, conditions which will greatly influence and govern the treatment of the group which is to surmount it. Difficulties of conceiving proportions as affected by foreshortening have to be overcome, and they can be studied in the initial stages of rough sketches together with the composition. A templet is prepared to 1-inch scale to show the general lines of the architectural elevation, the pediment under consideration and a slight indication of the character of detail surrounding.

The object of preparing this templet is, firstly, to be of material assistance to the sculptor in modelling his sketches; secondly, to keep the elevation of the building vividly before his mind, so that he can well realise the conditions and be directed by them.

The rough studies as they progress will be repeatedly placed upon the pediment, and the points of composition, proportion and foreshortening of the figures in them thoroughly considered until they are decided upon. During this stage of his work the sculptor is resorting to the use of the living model, for in modelling the human form, no matter how naturalistic or conventional it is to be, the use of nature cannot be dispensed with. The actual presence and the movement of a limb of the living model will suggest ideas in composition which the most practised mind cannot always conceive, so that in the rough sketches for the composition of the figures in his group, and at every other stage during the process of modelling, the sculptor should always have nature before him.

From the rough composition study the sketch is advanced, and subject, character of costume and other attributes are thought out and designed. The sketch having been carefully worked up and having reached a more finished stage, and being satisfactory to the sculptor, should be placed upon the templet for the architect's inspection. Indeed, the architect should frequently visit the studio and carefully watch the progress of the work, show interest in the sculptor's efforts, and free expression of opinion should be indulged in. The architect must be satisfied with the design at this stage because the group is about to be modelled to the actual size required, and any necessary and important alterations had better be made in

the small sketch. In modelling the large group the sculptor naturally selects the medium of clay because of its pliability and softness. The setting up of a large group for modelling requires considerable skill, for each figure requires to be supported by irons, stout wire and other hard materials which are built up on the stand, and which more or less represent the skeleton of the human body. The vertebral column is set in stout iron, supported by a stronger piece which is fixed to the stand, and to it is attached the cross pieces and angular pieces made to represent the bones of the legs, arms and phalanges of the hands and feet. The utmost care and skill is wanted to build these up so that the pose of each skeleton shall be in its proper place, for it cannot be altered afterwards. The sculptor is able to build this up from the measurement and positions of the figures in his careful sketch. Thus he does not only have technical points been studied, but the general lines of utility and character, in so far as the application to the building is concerned, have guided the artist in his ingenious creation. As yet, however, he has only a fair start and a good and sound basis to work upon; the finished piece from his hands has yet to come. The applicability of his studies and careful sketch, although appearing to the architect and himself as satisfactory, does not obviate the necessity of its more careful study in the full-size model, and no matter how appropriate his work thus far seems, the sculptor in entering upon his next task is, for many reasons, apt to go astray. The style of treatment best suited to its architectural character, the manner of technique most practical and artistic for the material, expression, detail, grace of line and finish, have all to be managed and executed by him upon the large model, and the advice and suggestions of the architect in some of these points will be very necessary. Regarding the style of treatment necessary, the architect previously conveyed in a measure his wishes and ideas, but now, with the full modelling in course of execution, he is better able to define them. He will now find it much easier to express his views upon the kind of conventionality he might require, and how he would like the sculpture kept in the key of bold shadows and otherwise, for the large group is approaching its more definite form, and these points are easier of discernment.

Concerning the manner of technique most suitable for material, much might be said, but to briefly illustrate its importance let it be known that the treatment of modelling for one material will not suit another. For instance, delicate detail of very slender proportions which is practicable in the material of bronze would not be sound in marble and still less so in stone. It would be misplaced labour in either of the two latter materials, because not only might be extremely difficult to carve, but it would be susceptible of damage or soon destroyed by climatic agencies. Again, the texture of surface modelling in the one material must be quite different in the other. The dulness and density of stone allow it to hold shadow which cannot be felt in the more transparent quality of marble. The contrast between both of the materials and bronze is of course very considerable. The colour and strength of the latter are such that a freedom of boldness can be practised in the modelling which would be quite impracticable in either of the former materials. Moreover, expression and effect can be facilitated in this by use of acids, which produce additional colour. It will be seen that the sculptor has to study these materials and model them by executing in his modelling technique and texture which he will require to be carved or cast. It will also be seen that the architect will require to possess a general grasp of these points so that he should be competent to select suitable material for the enrichment of his architecture. I repeat, the sculptor is very apt to go astray when executing his full-size model. Let me suggest where. In the creation of expression, grace of line, detail and finish, the temptation to lose sight of architectural conditions is very strong. With the living model before him, draped in the costume which has been difficult to arrange, attended with splendid detail, attributes of symmetry and trophies and other matter inherent to the subject, the sculptor will see so much that is beautiful and artistic that impulse is to copy it all. He is so fascinated by all expression, detail and grace of line which appear before him that the applicability of his group to the pediment it has to adorn is very apt to be forgotten. He is greatly inclined to introduce too much rather than tax his ingenuity to realise what much can be left out, and in modelling a large subject which is to be applied to architecture these errors are too easily fallen into. The difficulty lies in the distinction that architectural work is vastly different from modelling for the pedestal in a gallery.

It is the architect's province to see that these errors do not fall into, and criticise accordingly, and he and the sculptor must be agreed that the model when finished and cast into plaster will be suitable to be carried out in its final material. But before the final stage is entered upon, the model should be temporarily placed in its position on the building and it should be tinted to resemble as near as possible

material it is to be worked in, so that the architect and sculptor can see the effect. This is a very necessary precaution, and one which should in all cases of the kind be exercised. If the group is to be in bronze, the sculptor has comparatively little more to do with it, having only to touch up the wax impression prepared for him previous to casting in the metal by the foundry. But if the work is to be carved in stone or marble, there will be a great deal that requires his supervision and the personal application of his skill. Commencing the cutting of the block of stone or marble, the first process is that of pointing, and this is usually done by an assistant, who as a rule does little else. Pointing is a process which enables the painter to cut away the material until very nearly within the surfaces required, and it is done by the aid of an instrument which is so constructed with a gauge that any point on the model can be accurately found in the material. Points all over the model are taken and closely put in the material, so that accuracy of measurement is obtained and a guide found for the carver who now follows. For convenience and care this is done in the studio, where the group is generally finished. The technique in carving will require considerable direction. In marble or stone the use of the file or rasp should be avoided, because they are apt to render the work hard. The finest and most artistic effects are obtained by a dexterous use and clean cut of the chisel and clawtool; the latter, for large and bold work, should be very freely used. The architect should have a general knowledge of the methods of carving and ideas concerning them.

I have dealt somewhat freely and at length with sculpture because I feel it necessary to emphasise how intimate must be the relation between the sculptor or decorator and the architect; and it will be seen also how important it is that the architect should have a very definite conception of the methods and difficulties in sculpture, and how impossible it really is for him to design with freedom in a material of which he can but gain general knowledge.

The principles in the application of the art I have attempted to describe are involved in most of the other decorative arts, but in my opinion in a less important manner, for the application of figures in form requires far more skill and study than is necessary in applying figures in colour. The latter has only one aspect in its composition, whilst the former must be correct from every conceivable point of view.

Proportion, scale and disposition of wall-paintings, mosaics,opus sectile, stained glass, carving of ornament, plasterwork, pottery, &c., must be directed by the architect, who should have a general knowledge of the technique of each separate treatment. He should be the better judge in placing these decorations, for he, having designed the building, will know the value of enrichment in his architecture, whether it be in form or colour.

There are probably no two arts more commonly used in architecture than those of the more ornamental carving or stained glass in their elaborate or modified ways. With reference to the former, there are so many good examples to be seen, so much that is ancient and modern which the student-architect can revel in, that the study of it becomes a standard one, and is one of the first which he takes to in his early career. I do not know why he should be set to model or draw from the cast for any other purpose than to obtain facility for freehand drawing, a knowledge of what carving is, how it should be applied, and to become versed in the various styles and orders; but I do suggest that there is an influence attending the study of this art which is acquired thereby, and usually unnoticed by him. It lies in the assumption that, provided the student attains excellence in this art he develops readiness for grasping more easily and freely the general principles of the applied arts. His quickness of perception is, in my opinion, trained more by this influence than any other course of study. The same agent is at work with the professional carver. A carver who is at first trained as a wood-carver very often develops an especial aptitude for doing other things. He possesses an expert and dexterous touch derived from the nature of the material and the use of the great variety of tools necessary. A carver whose early training is on stone or marble does not acquire this facility. There are many men, competent workers in several of the decorative arts, who were in their early days trained as wood-carvers.

There is probably no applied art which, in its manufacture, has more processes and technical stages to go through than that of stained glass, and a word as to its application may not be out of place. Stained glass is the most vivid kind of coloured decoration. In the ever-changing light of day the luminous quality of stained glass powerfully affects the lighting of the interior and its coloured decoration. This should be borne in mind by the architect, who will or should direct that coloured glass upon the south side of his building must not be treated too warm a scheme of colour. In a window the massing of colour and of figure subjects makes very important architectural features in the building; the distribution of coloured masses conveys proportion and the dimensions of figures scale, and a

window might not only in itself be ruined, but the whole interior seriously affected by the want of care and study of these points. It is most essential that the designer of a window should visit the building, carefully study the architecture and architectural conditions attaching, and make rough sketches on the spot. The architect should insist upon these precautions being taken, for a happy coloured scheme cannot be conceived without them. The habit of adapting a figure to a space just because it fits should not be encouraged, because it is invariably found to be a faulty one. The adaptation of a figure designed for one window cannot comply with the conditions of a similar window in a different building.

Throughout the various stages of stained-glass manufacture the worker himself is often perplexed about his results. He is continually experiencing the feeling of uncertainty for the effects he is striving for. So many points in the material and process are apt to play him false. It is also sometimes bewildering to him to know and to gauge the key of coloured glass to use, the strength of painting, and its breadth of treatment most suitable for the building. Experiments and trials are inevitable. A stained-glass window, or a portion of it, should always be temporarily placed in its final position so that its effect and value can be truly realised. To give a thorough description of the art of stained glass would mean an extremely long paper; hence my brief reference to it, for it was only my intention to touch lightly upon the descriptive side of one or two arts, my motive being to point out the difficulties of technique and design in the applied arts, and to endeavour to show how hard the architect's position must be concerning them. Reference to all the arts mentioned is quite unnecessary, because the principles I have tried to mark out which apply to one apply to another.

The attitude of the architect towards the craft is a difficult one. He in turn is apt to stray in the utilisation of this or that craft for the want of technical information. Therefore I think his study of decorative arts should not be neglected, for it is very necessary; also that his studies ought to be confined more to the technical side of them rather than contriving to excel in the artistic productions of draughtsmanship, and I venture to express the hope that such technical studies will be set the students in the Architectural Association's new school. On the other hand, I suggest that the decorator in his early studentship and in later life does not give that thought and study he should to architecture, which is so important for his work. The attitude of the architect should be one of collaboration with the decorator. He cannot possess the sound grasp of technicalities of all the decorative arts which he should have, as I have attempted to show, for the complexity of work of all kinds in his profession renders it impossible. He must have confidence in his decorative artist. I would plead for the more intimate relationship between them, that one shall become used to the methods and feelings of the other. In the production of a noble conception in the art of architecture, harmony and goodwill must pervade the minds of the producers. Each must be familiar with the taste and ideas of the other. The architect who conceives the noble idea must extend personal feelings of consideration to the workers who are to build it up, so that they feel their efforts encouraged and their labours appreciated. Their mutual and friendly efforts will produce happy results, and the structure in stability will be established and in the refinement of beauty adorned.

Mr. Halsey Ricardo, who proposed a vote of thanks to Mr. Forsyth, said he was to some extent out of sympathy with the paper.

Mr. R. H. Weymouth seconded the motion, supported by Messrs. Gregory Collins, W. A. Pite and C. Tucker.

WELLINGTON MONUMENT, ST. PAUL'S.

THE following statement has appeared from the committee:—

Efforts for the completion of the monument had been in abeyance since the death of Lord Leighton, who was the chief subscriber to a fund for moving and completing the monument. On March 18, 1899, Mr. D. S. MacColl, by an article in the *Saturday Review*, attempted to revive interest in the scheme, and draw attention to the danger of further dilapidation to which Stevens's model was exposed. This led to Lord Hardwicke taking active steps in the matter. He questioned the then premier, Lord Salisbury, in the House of Lords, but received no encouragement to the hope that the Government might take action. It was then determined to rely on private effort. It was ascertained that the model was available, that the Dean and Chapter of St. Paul's, whose permission was necessary, were willing to consider a proposal for the completion of the monument, and that funds sufficient to cover an estimate made after careful inquiry would be forthcoming from a body of private subscribers.

The promoters then formed a committee, of which the

Bishop of Stepney consented to be chairman, with Lord Hardwicke as treasurer, Mr. Harold Hodge, hon. secretary, Mr. D. S. MacColl, and Mr. Herbert Trench, who had been independently interesting himself in the matter. At a later period Mr. J. R. Clayton, who had been intimately associated with Lord Leighton in the previous movement, brought valuable help.

The committee then approached the Dean and Chapter and obtained their assent to the scheme on the conditions already enumerated by the Bishop of Stepney, viz. that all indications of Stevens's intentions were to be followed as strictly as possible, that the sculptor proposed should be approved by them, and that he should submit a model and a statement showing what he proposed to do by way of preparing Stevens's group for the bronze-founder. The committee accepted these conditions, which entirely met their views.

They then bought from Mr. Stannus, who had loyally guarded it since the death of its designer, Stevens's plaster model, and proposed to the Chapter the name of Mr. John Tweed, whose ability had been vouched for by high artistic authority, and whose zeal for Stevens's fame was known to them. He prepared a reduced model and drew up the required statement, acting in close co-operation with Mr. Somers Clarke, surveyor of the cathedral, who had been actively interested in the previous efforts to complete the monument and whom the Dean and Chapter consult in all matters pertaining to the cathedral monuments. The Dean and Chapter then declared themselves satisfied and Mr. Tweed was commissioned to proceed with the work.

It cannot be too clearly understood that Stevens's design is in all essentials complete, and that its general effect will in no way be altered by the work that has to be done with a view to preparing it for casting. Several broken or missing details have to be supplied, but ample authority exists for them in the original sketch-model at Kensington. In other details the indication of surface modelling is left in the rough but sufficiently defined, and a competent sculptor will be able to get the surface into a condition congruous with the bronze of the existing groups by faithfully following existing indications. There is therefore no question of a new designer being called in or another sculptor glorified at the expense of Stevens. The criticisms that have already appeared are apparently based on a slight photograph of the model published without the knowledge of the committee in an illustrated paper. It may perhaps be mentioned, as there appears to be a good deal of ignorance as to the facts, that the head of the Duke, which Stevens had carefully finished, does not appear in this photograph, because it had been detached by Mr. Stannus for greater safety. It is now in the possession of the committee.

The committee have throughout desired that all should be done in such a way that the public will be able to judge of the result of their sculptor's work before the model is finally cast, and that he should have the advantage, at that stage, of the criticism of his brother artists; and further, that full evidence should remain of Stevens's design as he left it. The plaster model will be preserved, untouched, for comparison and verification. A duplicate of the cast of it, made for Mr. Tweed's use, may, it is hoped, find a place in some national museum; and Mr. Tweed's model, when his work has been done upon it, will be tried in position before it is handed over to the bronze-founder. Then, in our opinion, when the project is actually before the eyes of the public side by side with Stevens's models and drawings, will be the moment for useful criticism.

The committee were quite unaware that Sir Edward Poynter had made a renewed appeal to the Government in the year following Lord Hardwicke's, and had repeated it since. As he did not approach the Dean and Chapter, the committee had no means of knowing of his action, and regret that his spirited efforts were consequently made in ignorance of their own.

ART A NECESSITY.

AN address was delivered on Saturday by Alderman the Right Hon. William Kenrick at the Central School of Art, Birmingham. He described art as a thing expressed in terms of form and colour. As our common speech was to communicate thoughts, to convey knowledge, to appeal to the emotions and thereby to give pleasure, so it was in art. It instructed and gave delight, and if it were good and healthy art it called forth the best feelings and emotions and gave the purest pleasures. The alphabet of art was borrowed from nature, whose inexhaustible storehouse of beauty in form and colour had been the artist's great source of inspiration from the beginning. Hence it followed that the natural forms and colours of flowers, plants, birds, beasts and of man himself must be studied, and the knowledge gained stored in the mind. How were they to be studied? With the power to draw came the power to observe accurately; it was doubtful whether it could come in any other way. Besides

the assistance which the power to draw would give them in the study of nature they would find it of great service in their business, for a sketch would often explain perfectly what long word descriptions would fail to make clear. But even if it were of no further use it ought to bring great pleasure to them. In these days everyone rode a bicycle. Let them mount their bicycles and get into the country; not with the object of scorching on a dusty highway, but of finding out a cool, retired, pleasant country lane wherein to study the flowers and foliage, to make sketches, perhaps to try a little landscape work. If they did they would never find nature dull or uninteresting, or be at a loss how to employ their holidays innocently and delightfully. If they could not get into the country they might do worse than take to window gardening. If all boys and girls were true art students what a different world this might be. Bank holidays, instead of being the terror of quiet dwellers in the country, and indeed to everybody except the public-house keeper, would be a joy festival in which the most refined and cultivated would delight to take part. Green fields would not be desecrated by streams polluted by the refuse of the villages and towns; even the picnic party would gather up their waste paper and broken bottles, and 'Arry's and 'Arriets would be gentlemen and ladies. How far, alas! were they removed from this Utopia. From their art studies they would also learn what to admire—what was in good taste and what was in bad taste. There was no greater mistake than to suppose that a correct judgment in matters of art came naturally to civilised man and that the faculty did not require cultivation. Of no branch was this more true than of decorative art, in following which it was necessary first to remember the use of the article upon which they were engaged. The ornament should always be subordinated to that. Work became extravagant and offensive when pride and ostentation were dominant. In the present day they were surrounded by so many examples of bad ornamentation of the advertising tradesman order that they might be excused if at times they lost their heads and were led astray. In spite of all the difficulties and drawbacks they must resolutely keep to the right path—the way of simplicity, reverence and humility; though even in that there were pitfalls to be avoided. Though art must be founded on the knowledge and study of nature it was not nature. It was distinct from nature and an exact copy of nature even if it was possible was not art. What the artist had to express in his work were the impressions made upon his mind, the emotions awakened in his heart by the beauties of nature; the tenderness, delicacy and refinement which he saw in natural objects. These must find expression in his work, and the remarks were true even in landscape-painting. The landscape-painter selected, grouped, modified, emphasised as the idea in his own mind prompted him to do. Exact imitation with the intention of fascinating the senses he knew to be a poor and contemptible trial, and he discarded it for the more worthy ambition of uplifting their feelings. The work of the true artist was a creation which he embodied the spirit but not the exact letter of nature's lesson to him. Turning to the Municipal School of Art the right hon. gentleman remarked that the student who went there had opportunities of completing his training whatever branch of art he selected, an advantage which a generation ago did not exist. He urged his hearers to avail themselves of the advantages provided for them by the public spirited founders of the school and the wise liberality of the City Council. Art was difficult—most difficult—and demanded the wholehearted devotion of those who looked to succeed in it. But to his mind success in the production of beautiful things was like wisdom, which they were told was more precious than rubies or much fine gold. To crown them with this exceeding great reward talent and unremitting energy were needed, but he had confidence that in the sons and daughters of this great city neither of these virtues would be wanting.

Mr. Jonathan Pratt said there was a time when it was thought that art could only be included within a gilt frame, but he was glad to find an increasing acknowledgment that art could take all kinds of forms, be introduced into all kinds of articles, and into the most remote corners of the house.

Mr. E. R. Taylor stated that Alderman Kenrick's quart of a century's work on behalf of art had certainly borne fruit and fruit which would be good for the city. A few years ago a number of the certificates distributed that evening would have been prizes, and it was interesting that one of the small branch schools—Cowper Street—had secured fifty-two certificates, a larger number than would be obtained by many schools equipped almost as well as the Central School. Alluding to Alderman Kenrick's bank holiday reference, he said it occurred to him that few art students became rowdy or were seen in the police-court.

Alderman Kenrick, in reply, said he heard among the fathers that art was a luxury, that the extension of the Art Gallery was a luxury that could be postponed. He ventured to say that it was not a luxury. It was no more a luxury than breathing and seeing were luxuries. Wherever they had to

fragmentary record of him, prehistoric man was an artist. Wherever they would find that as soon as man satisfied the wants of his nature he became an artist, and if that were the love of the beautiful were inherent, it was as much a part of his nature as the power to see and breathe. Therefore he thought that art was not a luxury but an essential to the true development of man.

THE GOTHIC REVIVAL.

LECTURE to the members of the Ruskin Society of Birmingham was delivered by Professor C. H. Herford "The Gothic Revival and its Place among the Nineteenth-century Ideals." He said the forces of the revival were at work in the middle of the eighteenth century. At an earlier date Milton, who was regarded as the great classical poet, was not recognised as the great master and head of the English Romantic movement, did a little in his poetry to promote the revival, and his influence, early in the eighteenth century, was one of the most potent literary forces which checked the Augustine ideal. After referring to Gray's "Elegy" as another step in the direction of the Gothic revival, he said that Horace Walpole's Strawberry Hill created Gothic interest in walls, and Scott appreciated it, not on the side of the mysterious, but the picturesque, whilst Keats was more sympathetic to the richness of Gothic colouring. For the non-profound interpretation of Gothic architecture, however, they had to go to Germany. In 1770 Goethe arrived at Strasburg, and his visit published by him forty years later of the month spent at that city was one of the most kindling things in modern biography. He was introduced to Ossian and the "Vicar of Wakefield," and he was greatly impressed with the charm of the smith's ideals, whilst his eyes were opened to the glory of the resplendent. But the glories of Gothic architecture were open to his own observation. In one of his masterpieces the poet immortalised the builder of the cathedral of Strasburg, and the indication of German building craft and German rationalism was firmly aggressive. Goethe, however, opened a page of the Gothic revival which gave it a new and richer development. The lecturer then referred to the inspiration evoked by Ruskin's "Stones of Venice" and his "Seven Lamps of Architecture." Ruskin, like Goethe, was a man of intuition, but he led into his writings an expression of brotherhood. There was to him true brotherhood expressed in the masonry of the Palace. The effect of the new school was the emancipation of the Gothic architect from the sordid builder.

LECTURES ON SCULPTURE AND OTHER ARTS.

THE course of lectures by Mr. Alfred Gilbert at the Royal Academy began on Monday. He said that he had carefully refrained from publishing the customary syllabus of lectures, firstly because he preferred to be free, and secondly because of the great difficulty he had experienced on other occasions in carrying out a previously-arranged programme. They were there that night to discuss the subject of sculpture, and to consider its work, methods and relations to other arts. It was needless for him to define sculpture—all knew what it was—and he would proceed to speak of its relations to other arts. He considered that no form of expression gives the artist a medium so complete and so free as the art of the sculptor. Painters had many advantages over sculptors. But the painter—with all reverence to a painter—though beset with manifold pitfalls in his expression, not one iota of the difficulties of the sculptor. The painter's surface, he has colour and atmosphere to aid him, and he works with the sympathy of those who know nothing. The sculptor a work of art was a tangible work, a blind man could find pleasure in it by touch, and if handed round a blind man it would appeal without words far more than a verbal description of a beautiful picture. Recapitulating what he had said in some of his earlier addresses, Mr. Gilbert sketched the position of the sculptor in the time of the Greeks. The ideals and objects of the artists of that golden period. There was no Greek portraiture, strictly speaking, for to the Greeks it was profane to sit for a portrait. But when the Romans, who had seen other countries and had become conscious of the hideousness of their own surroundings, introduced Greek artists into Southern Italy, we got those portrait busts, wonderful as they were, always showed the sitter's worst features. The Romans lived much as we do, and as we do artists had to depend for a livelihood on personal patronage in portraiture. Hence the decline of the great Greek art of the decline of ours too, because though a hundred years ago we had men possessed of every quality necessary for the making of great artists, they had never seen the work of the

mighty Phidias, but were influenced instead by the marvelous realism of the Græco-Roman portraits. Portraiture, said the lecturer, means pandering to the vanities of often ill-shaped and ill-ordered individuals, who think that because their portraits are made they are patrons of art. This or that detail must be exactly right in their eyes, and such portraiture belonged to realism of the meanest nature. When a Greek made a portrait, as far as he was free to do so, it was the highest expression according to his lights of what his sitter should be, not what he was. Mr. Gilbert drew on the blackboard a design roughly representing a lamp with branches on one side labelled natural inspiration, convention, idealism, archaicism, and near the summit portraiture. This side represented ancient art. On the modern side the corresponding labels were anachronism, affectation, realism, imitation and portraiture. The qualities and aims of ancient art were compared with those of modern times, much to the disadvantage of the latter, and then taking realism as his text, Mr. Gilbert urged the students, when working in the schools, to make their models as realistic as they could. Let them be true so that they should see how ugly truth could be. He wanted them to learn by their studies how to tell a beautiful thing from an ugly one when they saw it. Technique had its uses, but it was only elementary, and its abuse made the student a mannerist. This was a strong argument against over-training in schools. It was bad for students to go on working together for prizes and so forth, all practising the same manner from which in the end they never escaped. Individuality was the thing, and the more inapt the artist's hand, as long as he could realise his ideals, the more charming his work would be.

TWENTIETH-CENTURY ART.

IN his final lecture of the session Mr. Prinsep began by giving the gist of his lectures to students in the Academy schools for the past three years, touching on the influences and styles at different periods in Greece, Italy, Spain, Holland, France and England. He pointed out, says the *Standard*, the patronage of the Church in Italy, of nobles in Spain and of honest citizens of Holland. Then he referred to the forced position of English art in Johnson's time; and after cursory allusion to his two preceding lectures, which dealt with the nineteenth century, he passed to the present one, saying, however, that as he was debarred from alluding to living painters he would leave his hearers to think out what little he could say. He did not believe in schools, but men of the time were striking out their own line as surely as did those of last century, but the influence of an age must in some measure be a continuation of that just past, though the echo got weaker and weaker as its sounds travelled from the starting-point. He saw that execution was higher, there was less feebleness, but he sadly noted a greater display of self work which cried aloud "See how cleverly I express myself," but the mirror held up by such pictures was not one that reflected nature, but the artist. Smart passages in a work that was not good as a whole were like the modern plays, full of quick repartee which would be intolerable as conversation in real life. There should never be personal display. It was better to labour than to affect the freedom of Velasquez. There should be no slurring; it was better to leave out than to slur, letting what was done be done with care and honesty. Slur and want of care were proofs of being bored, and how could the public be expected to like what had bored its author? Achievement and knowledge should be seen but not boasted of, for to show too much knowledge denoted want of balance. Technique, said the lecturer, was of the first importance to a painter, and it could be learnt, but imagination could never be taught, and there was danger in taking subjects from writings, as a man might not then depend enough upon himself. An axiom was that poetry should always be present, but more in treatment than by subject. Great determination should be exercised in selection. There was, however, a saying that a painter was hardest at work when his hands were idle, and he feared this saying was responsible for a great amount of idleness. Referring to prettiness—which he explained as being "beauty without nobleness"—he said it was the most popular, because the most easily understood. It was never original, but came from tradition, and the acme of its feebleness was reached by the female beauties, without life or individuality, in the old "Keepsake," but to this day the French speak of the "beauté kipsake." One form of popularity had always been common, namely, the glorification of the young lady. The high prices attending this cult caused it, and would always be so while the male was the purchaser of art. He warned the students not to fall into the easy convention of the "Keepsake" order, but to give rein to the joys of life, never pandering to pruriency, as was sometimes found in France, and which lowered art and artists. Prettiness came to-day in a thousand ways, by repetition of a successful line, although he knew

painters who groaned at being compelled to repeat themselves, for the treadmill did not tend to nobleness of thought. *Genre* had taken so great a hold it was almost a necessity; and even in history or allegory there was much *genre* introduced. First efforts often had a success due somewhat, perhaps, to generous feelings on the part of other artists, but they must remember it was as difficult to reach the applause of the public as to reach a man's own ideal. They should create their own ideals, not being led by fashion or bowing to false gods, but paint from the heart and without eccentricity, and there would be no fear for the art of England in the twentieth century. Hesitation should be felt to pronounce infallible judgment on contemporary work, for time alone could determine it; but press criticism should do much good, as it helped to popularise art and to make the people think.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE eighth general meeting of the session was held on Tuesday evening, the 20th inst., in the Grosvenor Hotel, Dublin. Mr. C. J. McCarthy (city architect) presided. A lecture was delivered by Mr. A. E. Child, who has recently been appointed teacher in the School of Art, Kildare Street, on "Stained-glass Work." The lecturer dealt with his subject from the point of view of a craftsman thoroughly imbued with the higher principles of design, and in sympathy with that school of thought which, avoiding mere copyism of past accomplishments in art, seeks inspiration from the best elements of such, and goes to nature's boundless garden for the rest. The pictures thrown on the screen included a number of windows recently put up in Gloucester Cathedral, illustrating the best principle which should influence stained-glass work. The lecturer explained in detail the method of painting glass, and advocated the doing of the whole window together rather than in separate bits, as often in commercial work. He showed that the use of enamel as a colouring medium was bad because of the difference between the power of contraction and expansion between the glass base and the superimposed enamel; the pigment should fuse at a slightly lower temperature than the glass so as to become part of it during the burning. It is often necessary to subject the glass to two or three burnings before the right effect is gained. The usual course is to use tinted or white glasses, and by shading them with a preparation of oxide of iron and manganese to obtain the required effects and outlines. The lecturer indicated on one picture a form of Celtic decoration which is at present being taught to the students in the School of Art. He spoke very strongly against the popular way of cutting down the prices allowed for stained glass below that at which it was possible to get good work, and advocated concentrating the effort and expense on one part of the work in preference to carrying out a large quantity of mediocre design and workmanship, and to leave everything else quite plain until it is possible to complete all in harmony with the first.

A hearty vote of thanks was proposed by Mr. Harry Albergy, seconded by Mr. Beckett, and passed with acclamation. Mr. Sykes also spoke.

The lecturer having replied and explained the few points which had been raised, the proceedings terminated.

CRETAN PICTURE PAINTING.

AT the Royal Institution, on Thursday, the 22nd inst., Mr. Arthur Evans gave his second lecture on "Pre-Phoenician writing in Crete and its Bearings on the History of the Alphabet." The first lecture was delivered on January 15. The lecturer said that his investigations from 1894 onwards led to the discovery of early forms of writing, mainly on small objects. But he had always hoped that Knossos would furnish ampler materials; his work, however, was interrupted by the insurrection. In 1902, however, he had found the site of the Minoan palace, and the results of his labours might now be seen in the rooms of the Royal Academy. Before dealing with the script he would illustrate the character of the civilisation, which 2,000 years before the earliest Greek literature had attained high level. The plan of the palace was then shown on the screen, and disclosed great complexity of design and massiveness of structure. The sculpture, in marble and hard plaster, like *gesso duro*—notably in a lion's and an ox's head—was of marvellous vigour and finish. Like excellence was shown in the human frame. In the offices and magazines were found clay tablets with clearly developed linear script. This system presented analogies to what was found in Babylonia, though the writing was widely different. One was struck with the extraordinary method shown in the arrangement of these deposits. The seals placed on the several classified collections bore the signatures of the various officials. Some of these clay tablets were carried off, by a workman probably, to Athens, where he recognised by the formula that they had come from

Knossos, and he was able to assign their proper position. In the reign of Nero, after an earthquake, it would appear that a discovery had been made of tablets which were taken to be Greek, though the letters were not Greek. Hence arose the story of Dictys Cretensis and his history of the Trojan war. These, however, had not been interpreted. To many of the inscriptions pictorial designs were added. The inscriptions, many of which referred to inventories and accounts, disclosed a numerical system which might without great difficulty be deciphered, and showed how deeply rooted the principle of decimals was implanted in the human mind. There were great varieties of the same script in the same temple. Besides the inscriptions on tablets there were others on pictured vases, reminding one of the vases of classical times. There were, too, inscriptions in ink, on perishable materials were sometimes employed, and there have been in Minos's day a larger literature than would have been expected at that early period. Some of the signs had a double signification—in the first instance a sign would indicate a whole word; in other cases the same sign meant only a syllable. The pictorial origin was in some cases shown by these signs and the more lately developed letters pretty clearly in others more obscurely. Some of these inscriptions were of persons, whether of officials or slaves. The personal names were of great importance and showed an interesting variety of termination, indicating sex and also declension. An inference was that the language was not Semitic and may have belonged to the Indo-Germanic family. There were several systems of writing, the pictographic being much earlier than the linear, but existing concurrently with the latter to a comparatively late date. It might, indeed, be found that the systems had a common origin. But it was probable that the time of the later palace—about 1800 B.C.—the linear system was the usual one. There was evidence of the influence of an alien influence from which, perhaps, the linear script was derived. Considering what had been discovered in Egypt and Babylonia, one might well believe that a literature of considerable development existed at this early period, and that much which had hitherto been regarded as legendary might be an historic basis.

THE CARPENTERS' COMPANY.

THE Carpenters' Company, following their action in previous years, have arranged for a series of lectures on matters connected with building to be delivered in their hall, in Lombard Wall, on Thursday, February 19, and the four succeeding Thursdays, at 8 P.M. The subjects will be as follows: February 19, "Ancient Rome in 1903," by Professor R. I. Smith; February 26, "Where Town and Country Meet," by Dr. G. V. Poore; March 5, "Modern Furniture, Movable and Fixed," by Mr. J. Alfred Gotch, F.S.A.; March 12, "Canterbury Cathedral," by Professor T. Roger Smith; and March 19, "The Nile Dam, Assouan, and Egyptian Irrigation," by Maurice Fitzmaurice, C.M.G. The lectures will be illustrated by lantern photographs and in other ways. The Carpenters' Company have recently appointed Mr. J. Hutton Freeman as their clerk, in the room of Mr. Stanton W. Preston, who retires after 25 years' service.

THE ART OF DANTE GABRIEL ROSSETTI.

AN illustrated lecture on "The Art of Dante Gabriel Rossetti" was given in the Midland Institute, Birmingham, by Mr. Whitworth Wallis. He sketched Rossetti's life, his close association with Ford Madox Brown, his intimacy with Holman Hunt and John Millais, and the foundation of the pre-Raphaelite Brotherhood, which particular part of English art he illustrated by the simplicity of the pictures, "The Girlhood of the Mary Virgin" and "Ancilla Domini." The latter, he said, was the most important outcome of the pre-Raphaelite movement. Mr. Wallis described the salient characteristics of many of Rossetti's pictures, drawing special attention to the unfinished "Fanny" the artist's solitary picture of modern life, the "Beloved," the "Bride," the "Loving Cup," "Lady Lilith," "Rosa Triquetra," the "Llandaff Triptych," the "Blue Bower," the "Christ and Carol," "La Bella Mano," together with the "Beata Beatrix" of the National Gallery, painted after the death of his wife, of several drawings were shown. The lecturer also referred to the splendid "Proserpine," which was, as the artist considered, the "very flower of his work," his portraits of Mrs. W. Morris and other ladies who sat to him (dismissing the statement that he always painted from one model, from one type of womanhood), the "Blessed Damsels," which several studies were shown, and finally "The Dream," which a famous artist truthfully said "would be among the half-dozen supreme pictures in the world."

allis also touched upon Rossetti's skill as a designer, notably the drawings for Moxon's Tennyson and the stained-glass windows, the cartoons for which had been lent some time ago to the Art Gallery by Mr. Charles Fairfax Murray, whose selection of Rossetti's work was unequalled, and who had presented to the museum the fine series of Burne-Jones cartoons. The lecturer said that Rossetti would always be regarded as one of the chief intellectual forces in the establishment of the modern decorative school in England. His work possessed a magnetic quality which irresistibly attracted the cultured mind. Rossetti had but one aim in art—to find out something to say, and to say it beautifully. From a popular point of view his types of noble beauty and the treatment of his subjects might often be foreign to common sympathies, but this was the old story of the idealist and the realist, and the latter was often unable to dispense with such symbolism, and scarcely Rossetti's work, without the aid of a printed catalogue. Future generations would understand his work better than the people of to-day. Many of his examples were passionate poems in colour, and the lecturer begged the audience not to judge Rossetti by his later work, with which they were more likely to be familiar, when his drawing was often defective and his colour crude, and which was produced when he was suffering from insomnia, failing sight, and the joy of living was becoming less and less, but rather by those earlier works which would ever secure for him analted rank in the history of English art.

At the close a hearty vote of thanks was accorded Mr. Wallis for his address.

TESSERÆ.

Twelfth-Century Building in France.

THE monastic establishments, so wealthy in the twelfth century, set the example of civil constructions in stone, and the example was followed by private individuals. It must be said to the honour of the builders of this epoch that in adopting ashlar or rubble in place of wood they very frankly took a mode of construction suitable for these materials, and did not attempt while using them to reproduce forms or arrangements which were suitable for timber construction. They were disposed to preserve its real function and the appearance befitting it for the material employed, they did not attempt in the least to dissimulate the nature of the materials. The means employed were, nevertheless, of an extreme simplicity, and those artists who, in their ecclesiastical constructions, from the twelfth century onwards, showed a singular ability, research, and used such complicated methods, contented themselves in civil buildings with the most natural and the least complicated. Economical of materials, which then cost comparatively more than to-day, their dwellings are during the twelfth and thirteenth centuries reduced to what is strictly necessary, without pretending to appear anything more or different from what they really are; that is to say, walls pierced with openings, carrying floors formed of exposed beams and posts, well sheltered on the street and courtyard fronts by projecting roofs, throwing the water well away from the faces. Very rarely, unless it may be in a few towns of the south and centre of France, the ground floors were vaulted, consequently there were no buttresses, no projections on the exterior, most frequently the walls are in exposed scabbled rubble-work with the occasional belt-courses, the jambs and lintels of doors and windows of cut stone; still, these lintels and these jambs are not bonded, but are simply facings on the outside—the belt-courses alone bond together the interior and exterior faces of the walls.

Babylonian Sixties.

While we are lost in admiration before the stone tapestry of the palaces of Nineveh, and surprised at the ingenuity of a Moush, Lassen, Rawlinson, Hincks, Norris and Oppert, who had discovered in these cuneiform inscriptions the real language of Sennacherib and Darius, we are not aware that, to a certain extent, we are all still Babylonians, and that we carry about with us and read every day what is, to all intents and purposes, a Babylonian inscription, namely, the dial-plate of our watches. Why is our hour divided into sixty minutes, each minute into sixty seconds, and so forth? For the same reason, it would appear, for which the Greek talent was divided into sixty minæ, originally each mina into sixty shekels—a Babylonian word, literally translated by the Greek *stater*. It was in Babylonia—and at first in Babylonia only—where, in addition to the decimal notation, there existed for all practical purposes a sexagesimal system. Why the number sixty was fixed upon instead of ten, or twelve, or twenty or a hundred, it is not difficult to see, for no number has so many divisors as sixty. What is important is this, that while even the French, when revolutionising weights, measures, coins, dates and everything, rejected our clocks and watches, the Babylonians, those cautious conservatives of the East, carried their sexagesimal system right through everything, not excepting the high-roads

on earth or the high-roads in heaven, but dividing the sun's passage into 24 parasangs or 720 stadia, and subdividing each hour into 60 minutes, each minute into 60 seconds. Hipparchus, the great Greek astronomer, about 150 B.C., availing himself of the observations of Babylonian astronomers, introduced the hour, with its 60 minutes and 3,600 seconds, into Greece. Ptolemy about 150 A.D. adopted and thus gave still wider currency to the same system. With Ptolemy's work it was carried down the stream of traditional knowledge through the Middle Ages to the cataract of the French Revolution, and after passing safe and sound through that fearful crisis, it will probably be the last remnant of Babylonian antiquity hereafter to be swept away by the decimal system which, revolutionary as it may seem, is nevertheless the most rational, the most natural and the most ancient numerical system of the world. It was known from Greek astronomers that the Babylonians divided the circle into 360 degrees, and the degree into 60 minutes. It was also known, from the fragments of the Babylonian history of Berosus, that their political and mythological chronology was based on a sexagesimal system. They counted by *sossi* and *sari*, the *sossos* representing 60, the *saros* 60 × 60, or 3,600 years. The *neros*, which is mentioned by Berosus as consisting of 10 × 60 or 600 years, might well have been dispensed with, at least for arithmetical purposes, for whenever there are two figures in the row of *sossi*, the former would necessarily represent the so-called *neri*. According to this system Berosus says that the Babylonians counted 120 *sari* from the creation of the world to the Deluge—i.e. 120 × 60 × 60, i.e. 432,000 years. This is an important period in the historical traditions, or rather in the astronomical and chronological fictions, of the ancient world, and it was adopted, for instance, as the duration of the Kaliyuga by the Hindus, who, like the Greeks, became in later times the pupils of the Babylonians.

Sculpture and Painting.

The art of sculpture is a much fairer and more impartial representer of beauty of form than that of painting; for, as it exhibits form only, it can employ no tricks of light and shade to give preternatural distinctness to one part, or preternatural obscurity to another; and, as its imitations are complete as far as they extend, it can leave nothing to the imagination, nor employ any of that loose and sketchy brilliancy of execution by which painting gives an artificial appearance of lightness to forms which, in nature, always appear heavy. The forms, therefore, both of the human figure and countenance, which are peculiarly appropriate to sculpture, require exact symmetry in limb and body, muscles and joints strongly indicated, regular and distinct features, full lips, prominent brows and curly elastic hair, more accurately divided into masses than it ever is by the unassisted hand of nature. Even the most regular arrangement of it into locks and ringlets has been employed, by the great sculptors of antiquity, with the happiest effect, which it never could be in painting. This character, though very different from any that is commonly esteemed beautiful, has, nevertheless, peculiar beauties for eyes conversant with the fine productions of ancient sculpture; whence we may reasonably infer that, had this art been as generally and familiarly understood, and as universally practised, as that of painting, we should probably have heard of a sculpturesque as well as a picturesque, since the one exists in nature just as much as the other. But the imitations of sculpture being less mannered and more confined than those of painting, its process more slow and laborious, and its materials either costly, ponderous, or cumbersome, the taste for it has never been sufficiently diffused among the mass of mankind to give rise to a familiar metaphor.

Remains in Herefordshire.

Herefordshire is a region which has its own very great merits, but in Celtic and other primeval relics it is certainly not rich. And it is singular, especially considering the contrast with the neighbouring county of Monmouth, how poor Herefordshire is in castles. Most of the Herefordshire castles are to be traced in little more than their mounds and a few shapeless ruins. This is as much as is left of Richard's Castle, in the north-east corner of the county, the earliest Norman castle built in England, and whose building helped in 1051 to set all England in a blaze. Nor does the county seem rich in Domestic architecture. The truth is that Herefordshire is one of the timber-building counties, and therefore cannot, in the nature of things, compete in the matter of ancient houses with stone districts like Northamptonshire and Somersetshire. But in this particular department of Domestic architecture Herefordshire contains one precious treasure, though its existence has become almost a matter to be taken on trust. The Bishop's Palace at Hereford consists mainly of a great timber hall of the end of the twelfth century, though so altered by modern casings and divisions as to be pretty well invisible. It is built on the same type as halls like Winchester, Oakham or Westminster itself before the changes of Richard II. That is to say, it is divided by pillars and arches, only of wood and not of stone. But unlike many other buildings which are thus divided

by timberwork, the Hereford pillars and arches are stonework reproduced in timber, and present good examples of the characteristic details of the date and district.

Chipping Wycombe Municipal Buildings Competition.

SIR,—Why do architects enter for such a competition?

Why do corporations, boroughs, town councils, &c., offer such stupid conditions?

And, lastly, why, oh why! does not our respectable Institute institute some safeguard for us poor weak-minded, irresponsible architects?—Your obedient servant, ONE OF THEM.

The Colney Hatch Fire.

SIR,—The fire which took place at Colney Hatch during this week, and the terrible loss of life involved, should surely be a warning once more as to the inadequate means taken by the profession which your journal represents for the prevention of fire. We constantly see fires breaking out in various parts of the country, which are only stopped by the assistance of our brave firemen; but still architects and building owners go on erecting large blocks of buildings, and no adequate means are taken to insure the use of fireproof materials throughout. Surely an Act should be passed by the legislature to insist that in every building, whether public or private, all floors and partitions should be of a fireproof material. I hold no brief for any particular system; there are many excellent ones, and the time has surely come when they should be universally used. We have made great strides in the matter of sanitation; surely it is time we paid more attention to the question of fire prevention. Apologising for encroaching on your space, but pleading the importance of the subject as my excuse,—I am, &c.,

A COUNTRY PARSON.

SIR,—Surely the Colney Hatch disaster will sufficiently stir up public opinion, and impress upon those in authority the great danger of building these hospital annexes and temporary structures in such a flimsy way, especially as fireproof materials can now be obtained eminently suitable for such structures. Can you inform your readers of the address of the makers of such materials, and say where buildings can be seen? It is a matter of national importance.—Yours, &c.,

PRO BONO PUBLICO.

[In our advertisement pages week by week many excellent systems will be found, as, for example, the back page this week.—ED.]

GENERAL.

The Home Office has this week informed the hon. secretary, Mr. Maurice B. Adams, that the King has graciously consented to the continued use of the term "Royal" in the name of the Royal Architectural Museum after its transfer to the Architectural Association. The original consent to use this style was granted by the late Queen in 1869, through the influence of the late Right Hon. A. J. B. Beresford Hope, M.P., then president of the museum.

The Liverpool Academy of Arts has elected the following members:—Full members—Messrs. J. C. Balmer, R. G. Hinchliffe, Alison Martin and Herbert Royle. Associates—Messrs. S. J. Brown, Alfred R. Martin, G. E. H. Rawlins and G. O. Work; Misses May L. G. Cooksey, Lily Day, Aniza McGeeham and Anna Thompson. The executive for the current year is as follows:—President, Mr. R. E. Morrison; hon. secretary, Mr. J. V. R. Parsons; hon. treasurer, Mr. R. G. Hinchliffe; hon. curator, Mr. J. Y. Dawbarn.

Mr. Cherubino Kirchmayr, who last year was elected a member of the Royal Society of British Artists, died last week.

The Hill of Tara is to be sold by auction in Dublin on February 5.

The Swiss Federal Council has issued the programme of a competition, open to the world, for the erection of a monument at Berne to commemorate the foundation of the Universal Postal Union. Copies of the programme may be had at the General Post Office, St. Martin's-le-Grand.

Mr. T. G. Jackson, R.A., has been requested by the Old Radleyn war memorial committee to submit for their consideration a scheme for a memorial at the east end of the college chapel, in addition to the plans for a canopy over the stalls which had been put before them.

Mr. J. Churton Collins will lecture to the Ruskin Union on Saturday, February 14, at 8.30 P.M., at the Dudley Gallery, Egyptian Hall, Piccadilly, on "Ruskin as an Educational Reformer."

The Chancellor of the Exchequer will, on Tuesday next, open the new Stanley Hall, South Northwood. The building has an interest for architects, engineers and men of science for it has been constructed at the expense of Mr. W. Stanley, the inventor of many philosophical and drawing instruments, in order to be presented to the people of the district.

An Order was made on Wednesday that the dispute between Sir Charles Wyndham and Messrs. Kirk & Rann should be referred to an architect and surveyor to be agreed on, or, in default, one to be nominated by the Court.

The British Archaeological Association recently passed a resolution stating that they hear with deep regret of the proposed demolition of All Hallows, Lombard Street. They add: "The richness of the carved woodwork and the subordination of ornament to structural needs render it specially worthy of preservation in the estimation of all who value the products of the master-mind of its architect, and desire to retain the remaining links between past and present times."

The Frinton Urban District Council have decided to promote a Bill in Parliament to enable them to carry out a comprehensive scheme of sea defence work at a cost of 20,000/. The sea has been encroaching on land in this part of Essex at the rate of nine feet a year.

The London County Council have granted an application from the Battersea Borough Council for a loan of 15,000/ for the erection of working-class dwellings on the Latchford allotments. The estimated cost of the scheme was 105,600/ and the present advance was asked for in order that the building might be proceeded with.

Dame Mary Anne Amcotts Ingilby has bequeathed to the National Gallery the portrait by Sir Godfrey Kneller of her great-grandmother, Mrs. Clarke.

Mr. Lorimer, the Scottish painter, and Mr. Goscor John, the sculptor, have been elected corresponding members of the French Académie des Beaux-Arts.

The Royal School of Art Needlework will shortly be removed to the new building at the corner of Imperial Institute and Exhibition roads, the funds for which have been collected by its founder, Princess Christian.

M. Jusserand, the new Ambassador from France to Washington, will bring with him some pieces of Gobelin tapestry for the decoration of the Embassy. Among them will be panels representing Summer and Autumn, which were designed by Audran.

The New Gaiety Theatre in the Strand is not likely to be opened before September owing to the demands imposed on the London County Council.

Mr. A. P. Trotter has reported to the Board of Trade the fatal accidents in the Fulham Baths, and it is expected that the report will soon be published.

The Twenty-first Congress and Exhibition of the Sanitary Institute will be held at Bradford, commencing July 7.

The Bishop of Liverpool stated at the annual meeting of the Diocesan Church Building Society that they required at least twenty new churches at present or in the near future, each with a vicarage and a parochial hall. Reckoning that each church would cost 15,000/., they had before them the prospect of raising 300,000/.

The Proposal submitted by the Architectural Association of Ireland that a qualifying examination should be required for admission into the Irish Institute of Architects has been referred to the Royal Institute of British Architects.

A Special General Meeting of the Liverpool Architectural Society will be held at 13 Harrington Street, Liverpool, on Monday next, February 2, at 6 P.M., and the fifth ordinary meeting will be held at the conclusion of the special general meeting, when a paper will be read by Mr. James Smithies on "Decorated Metalwork."

A Meeting of the Northern Architectural Association will be held at 36 Northumberland Street, Newcastle-on-Tyne, at 7.30 P.M., on Wednesday next, February 4, when Mr. A. Greenwell, F.G.S., A.M.I.C.E., M.S.I., of Westminster, will lecture on "Bitumen: its Application in Architecture and Engineering," with lantern illustrations.

At next Tuesday's meeting of the Institution of Civil Engineers, there will be a discussion on the papers, "The Nile Reservoir, Assouan," by Maurice Fitzmaurice, C.B., B.A.I., M.Inst.C.E.; and on the "Sluices and Lock-Gate at the Nile Reservoir, Assouan," by Frederick Wilfrid Stokes, M.Inst.C.E.

The Agent-General for the Cape of Good Hope, 100 Victoria Street, S.W., has been instructed to notify competitors regarding new Cape University Buildings that the time for sending in their plans, &c., has been extended to the last day of February next.

INCH HOUSE, BATHGATE: SOUTH-EAST FRONT.

CATHEDRAL SERIES, No. 430.—WORCESTER: THE NAVE.

THE

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 15,000*l.* Premiums of 60*l.*, 25*l.* and 15*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

ALDERSHOT.—For making-up a portion of Alfred Street and the Broadway next the Warren, West End. Mr. W. E. Forster, clerk to the Urban District Council.

LEEDS.—Feb. 3.—For formation of new streets upon the Ivy House estate, York Road, Leeds. Mr. John W. Fawcett, 10 Albion Street, Leeds.

PORTSLADE-BY-SEA.—Feb. 3.—For sewerage, paving, kerbing and channelling of certain streets within the district. Mr. Thomas Austen, clerk, Council Offices, Portslade-by-Sea.

SOUTHAMPTON.—Feb. 12.—For supply and delivery of a new 25 nominal horse-power portable engine and boiler. Mr. W. Matthews, M.I.C.E., waterworks engineer, 18-19 French Street.

WALES.—Feb. 9.—For lighting the new portion of the Swansea workhouse building from the Corporation electricity mains. Mr. Llew. Jenkins, clerk, Union Offices, Alexandra Road, Swansea.

WHARFEDALE.—Feb. 13.—For construction of a storage reservoir in the parish of Menston, for the Menston Waterworks. Mr. E. J. Silcock, engineer, 10 Park Row, Leeds.

YORK.—Feb. 12.—For construction of a bridge and approaches at North Lane, York, for the N.-E. Railway Company. Mr. C. N. Wilkinson, secretary, York.

YORK.—Feb. 16.—For sewerage, levelling, paving, metal-ling, channelling, &c., of all private streets required to be made up within the city of York during a period of twelve months. Mr. A. Creer, city engineer and surveyor, Guildhall, York.

ELECTRIC NOTES.

At a meeting of the electric-lighting and power committee of the Liverpool Corporation it was announced that Mr. Arthur Bromley Holmes, city electrical engineer, had resigned his position owing to considerations of health. The salary attaching to the post was 1,800*l.* a year. Mr. Holmes was recommended to be appointed consultant electrical engineer from March 1 next at a salary of 1,000*l.* a year, and the committee further recommended the appointment of Mr. A. Clough,

deputy electrical engineer, whose salary is now 700*l.* per annum, as resident engineer at a salary of 800*l.*

At the quarterly meeting of the visitors to the Bracebridge lunatic asylum on the 22nd inst. the chief subject dealt with had reference to the proposed installation of the electric light. At the last meeting the visitors considered the matter from several standpoints, and finally referred it to the building and sanitary committee to advise as to the expediency or otherwise of adopting electric light and power for the whole or part of the asylum, and to report as to its comparative cost as distinguished from gas or any other form of light. Being empowered to obtain expert assistance, the committee retained Mr. C. S. Vesey Brown as consulting electrical engineer at a fee of 28*l.* 10*s.*, and they now recommended the visitors to provide an electric installation for light and power purposes, both for the existing asylum buildings and those in course of construction, at a cost estimated at 4,500*l.* The committee's recommendation was unanimously agreed to, and instructions given for specifications to be prepared and tenders obtained.

The Bill of the great Ulster electrical scheme has now been drafted, and it appears that the intentions of the promoters are to generate and supply electric current for motive and lighting purposes over a wide area in the counties of Antrim, Armagh and Down, and in the city of Belfast. Large central stations are to be erected in Ballymena, Belfast and Newry, and power is to be manufactured in such quantities, and at such a price, that it is hoped the several local authorities, railway companies, tramway concerns and other large users of electricity will find it to their interest to purchase from the new concern. The greater part of the capital, 1,200,000*l.*, will be subscribed by a syndicate of London gentlemen, practically identical with that which has just carried out a similar scheme in South Wales, and on their behalf it is stated that there is no intention to enter into competition with local authorities already supplying electricity. The project, the first of its kind in Ireland, is calculated to confer great benefits upon power users in the country districts of Ulster, where coal is high priced and steam generation consequently often prohibitive. The many linen mills of the district, for instance, hope to inaugurate a new era of prosperity when the cost of driving the looms is reduced; and a considerable extension of electric tramways and light railways is looked for when the generating plant is in working order. The local authorities are, however, regarding the scheme critically. Newry has already decided to oppose

the Bill in Parliament on the ground that the land sought to be acquired for a generating station may at some future time be required for harbour extensions. It is believed that the County Down railway company will also appear against the measure, and the attitude of Belfast City Council and the Belfast and Northern Counties railway company has not yet been determined.

VARIETIES.

AT the Bethnal Green workhouse there will shortly be erected new dormitories and maternity wards. Mr. Finch, of 76 Finsbury Pavement, London, is the architect.

THE vane of the Dornoch Cathedral steeple, which was seriously damaged by the storm about a month ago, was, during the gale of Sunday night, completely blown down. It is only two years since the vane underwent a complete repair, including the regilding of the weathercock.

As a result of the recent open competition for public free library and technical school at Chadderton, Mr. Arthur R. Groome, A.R.I.B.A., and Mr. J. Lindsay Grant, Manchester, were awarded first premium; Messrs. Woodhouse & Willoughby, Manchester, the second; and the third went to Mr. Richard Holt, Liverpool. The assessor was Mr. A. N. Bramley, F.R.I.B.A., Nottingham.

THE eleventh International Congress of Hygiene and Demography will be held in Brussels from September 2 to September 8, 1903, under the patronage of His Majesty the King of the Belgians. The Secretary-General of the Congress is Professor Dr. F. Putzeys. All information and programmes can be obtained from Dr. Paul F. Moline, 42 Walton Street, Chelsea, S.W., the hon. secretary of the British committee.

THE formal opening took place on the 12th inst. of the new fire station at Rushden. The building is on up-to-date lines, and on the best principles for fire brigade purposes. There is plenty of space for the appliances, and on the east side is a tower for the fire escape. On the west is the caretaker's residence and a hose-drying tower, with an excellent drill and cleaning yard at the rear.

IN order to check further decay, Lord Abinger has decided to carry out certain renovations and repairs to the old castle of Inverlochy, a building which played no inactive part in the history of Lochaber. He also intends cutting down a number

of the trees which now grow so thickly round the ruins, so that the historical structure may be seen to better advantage from the railway.

A REMARKABLE sale is fixed to take place on Wednesday next, when Messrs. Douglas Young & Co. will, within the precincts of Newgate Prison, offer to the highest bidder relics of so gruesome a character that even the most morbid-minded curio hunter is likely to be satisfied. Among the articles to be sold will be the execution sheds, the toll-bell that has sounded the death-knell of many an assassin, the principal entrance door of the prison and the prisoners' interview boxes.

THE Council of the Society of Architects having been asked by the City Churches Preservation Society to express an opinion on the proposed demolition of All Hallows, Lombard Street, has intimated its opinion that, it being understood that by the sale of the site a large sum of money will be available for the provision of churches and clergy in the poorer parts of the Metropolis, the sale of the site is justifiable under these circumstances, more particularly as there should be no difficulty in removing the building and re-erecting it upon some other site, thus preserving the building and its fittings for more extended use and service.

IT is not often a town hall comes under the hammer, but that of the ancient borough of Sutton Coldfield will, in the course of the next week or so, be knocked down to the highest bidder. The town hall was designed by Mr. Geo. Bidlake in 1859, and erected at a cost of 4,400*l.*, part of the expenses being defrayed by the London and North-Western Railway Company, in consideration of their being released from the obligation to make a railway through Sutton to Lichfield. The placing of such an unusual lot in an auctioneer's catalogue is due to the fact that it is not sufficiently commodious for the Corporation, who recently acquired the building which was originally the Royal hotel and subsequently a sanatorium. A new town hall is to be erected on a site adjoining.

THE *Diamond Fields Advertiser* publishes details of the irrigation scheme for the Colesberg district. One hundred and forty thousand acres, fronting the Orange River, have been acquired, and the works will enable 16,000 acres to be cultivated, providing a good living for a thousand settlers and their families. The sum of 22,000*l.* required for the carrying out of the scheme has been furnished by the Rhodes Estate, Messrs. Wernher, Beit & Co., Mr. Abe Bailey and the Agricultural College. Part of the scheme is that after 5 per cent.

is paid on the capital the surplus profits shall be devoted to the requirements of the settlers.

A NEW club and institute was opened at Shirebrook, Derby, on the 17th inst. It is built of brick and stone, with tiled roof, is a two-storey building, and contains a billiard-room (which will accommodate two tables), card and bagatelle-rooms, reading, concert and lecture-rooms, refreshment-room and bar, committee-room and caretaker's dwelling-house. At the rear of the main building and adjoining the Great Northern Railway embankment will be constructed a bowling green and skittle-alley. The whole of the building is illuminated by electricity, and the entire cost is estimated at about 2,500l. The institute affords accommodation for upwards of 300 members. The contractors are Messrs. F. H. & J. W. Moore, of Shirebrook, and the architect is Mr. Joseph Perkin, of the same place.

THE Warrington Town Council have agreed "that the municipal non-trading committee be authorised to appoint two chartered accountants to examine the accounts, books, vouchers and documents of the Corporation for the five years ending October 31, 1901, and that he shall have a right to examine any officials, servants or workmen of the Corporation with reference to all trading with the Corporation by members of the Council, either as principals or partners, or through limited companies in which they have been or are shareholders, or whether the trading has been done direct or indirect, or as contractors or sub-contractors during the said five years" There is much agitation in the town on the subject.

THE new Congregational church on Primrose Hill, Kingsthorpe Road, Northampton, was opened on the 22nd inst. It has been built from the designs of Mr. Alexander Anderson, and is entered through a vestibule supported by high stone pillars, and stretching across the front of the chapel above the vestibule is a stone panel carved with eight life-sized figures symbolical of joyful worship. Over it are carved the words, "Approach with joy His courts unto." Over the radiator inside the porch is a brass tablet with the following inscription:—"The church and school were gathered by the patient love of the Rev. Thomas Arnold and members of Doddridge Church, who began their work in Kingsthorpe Road in 1865" At one end of the vestibule is a deacons' vestry, and at the other is a staircase leading to the gallery which stretches along the bottom of the chapel. The total length of the interior is 90 feet, and there is accommodation for 500, the seating consisting of

pitch-pine pews. The chapel is in octagon shape, the dome roof being supported by four angle arches. The electric lighting and heating arrangements are excellent, whilst the acoustic properties of the building were found to answer admirably. The building was erected by Mr. G. W. Souster, and the total cost is about 2,800l, exclusive of the ground, which only cost the chapel 200l, so that the total expenses run up to 3,000l.

BUILDING AND BUILDERS.

THE War Office has determined to erect fortifications for the protection of the town and port of Barrow-in-Furness. A fort will be built on Walney Island, having complete command of the entrance to Barrow and Duddon harbours, and here a garrison of Artillery will be maintained. Some years ago a fort existed at Walney, but it was abandoned. The interests of Barrow have since that time greatly increased, especially from a shipbuilding point of view, and it is deemed that these interests necessitate protection.

A MEETING of the Flesher Incorporation of the seven incorporated trades was held on the 23rd inst. in Trinity Hall, Aberdeen, Deacon Leiper presiding. A full discussion took place over the unanimous report of the sub-committee appointed recently to consider the question of the remodelling of the present slaughter-house buildings in Wales Street. After prolonged consideration it was resolved that the recommendation of the sub-committee be adopted and instructions given to send the plans to the Town Council for approval. The estimated cost of the whole scheme is slightly under 20,000l.

IN response to an advertisement for competitive designs for the new free library at Workington, seventy-three sets were sent in by architects from all parts of the kingdom. These were on view in the Edkin Street Drill Hall last week and attracted considerable attention. The assessor, Mr. Sidney R. Smith, of London, gave his award as follows:—1st premiated design, Messrs. W. A. Mellon & Geo. Wittet, York; 2nd premiated design, Messrs. Spencer W. Grant & Jas. C. Bowden, London; 3rd premiated design, Messrs. Alfred Co. & F. D. Clapham, London; highly commended (1) Messrs. Wills & Anderson, London; (2) Mr. H. A. Crouch, London; (3) Messrs. Hennell & Son, London. The premiums were 25l., 15l. and 10l. respectively.

THE new military hospital now being erected on part of the site of the old Millbank Prison will afford largely increased accommodation for soldier patients, and will be greatly in advance of the Rochester Row Hospital in respect of compliance with modern requirements. It is part of a considerable scheme of building which the War Office have in process of completion at Millbank. Already the new Army Service Corps Barracks, long wanted in London, are occupied, and the hospital, which will afford room for some 200 beds, will soon be finished. The hospital part of the scheme is estimated to cost 100,000*l.* It includes six separate blocks of buildings, carried out in red brick, with string-courses and dressings of sandstone, much after the style of St. Thomas's Hospital, and as in the case of that great institution there is provided suitable covered communication between the component blocks of the hospital. When the Millbank building is completed, the patients in the Rochester Row Hospital will be removed to it, but the latter institution will still be maintained for military patients, for whom in London the accommodation has long been unsatisfactory and insufficient.

BETWEEN 10 and 11 o'clock A.M. on Friday last an accident of a serious nature occurred in Marlborough Street, Dublin, when portion of a scaffolding erected in the grounds of the new training college attached to the offices of National Education gave way, and several men were thrown to the ground. The injured persons were James Neilan, bricklayer, 27 Thomas Street, thirty years; John Ivors, 30 North Anne Street, thirty-five years; John Regan, 30 Upper Tyrone Street, twenty-eight years; and Michael Casey, 23 Sinnott Row, twenty-six years. The four men were conveyed in the Corporation ambulance to Jervis Street hospital, where Dr. Ryan, house surgeon, decided on detaining Neilan and Ivors, who had fallen

a distance of 30 and 20 feet respectively, as the extent of their injuries could not be ascertained without careful examination. Regan and Casey, who had fallen about 14 feet, were not detained, as their injuries were not of a sufficiently serious nature to render such a course necessary.

MR. W. A. DUCAT, Local Government Board inspector, was on the 21st inst. engaged in hearing evidence bearing on the application of the Penrith Urban Council for powers to acquire part of the Whinfall Holme by compulsory purchase from Lord Hothfield. In consequence of the large sum—10,000*l.*—which his lordship was known to have asked for the land required, the proceedings were listened to with keen interest by a large number of townsmen, including most of the members of the Council. Mr T. Shepherd Little, instructed by Messrs. Scott & Allan, Penrith, appeared for the Council, and Mr. Alexander Glen, instructed by Messrs. Dawson, Bennett & Co., London, for Lord Hothfield. Dr. Craven, medical officer, appeared for the West Ward Rural District Council. Mr W. Little and Mr. C. N. Armstrong watched the case on behalf of interested local landowners. After a lengthy discussion, Mr. Glen and Mr Little addressed the inspector, and the inquiry concluded about five o'clock. The inspector visited the various sites during the afternoon.

A MEETING of the committee of management of the Aberdeen Art Gallery was held on the 20th inst., Mr. Murray, Glenburne Park, in the chair. The secretary, Mr. Hugh Macdonald, S.S.C., read the letter from Messrs. Morice & Wilson, advocates, agents for the trustees of the late Mr. John Clark, advocate, in Aberdeen, who resided at Clifton, Bristol, intimating a donation of 7,000*l.* for the purpose of altering and enlarging the Art Gallery, so as to provide a sculpture hall, any surplus and interest, after meeting the necessary expenses, to be devoted to the equipment of the hall. The committee received the intimation with very great pleasure, and in gratefully accepting the munificent offer of Mr. Clark's trustees, resolved at once to take the necessary steps to enable them to comply with the conditions on which the grant is made, and which the committee considered were in themselves most reasonable and proper. Mr. Marshall Mackenzie, A.R.S.A., the architect, submitted plans of the proposed additions, which were considered satisfactory, and the secretary was accordingly instructed to apply to the Governors of Robert Gordon's College for a strip of ground behind the Art Gallery for the necessary extension.

BEFORE the Glasgow branch of the Incorporated Society of British Decorators, Mr. James Paton, superintendent of the museums and art galleries in the Faculty Hall, St. George's Place, delivered a lecture on "Mosaics in History and Art." Colonel Bennett presided. After defining and describing the various classes of work to which the name of mosaic is given, and limiting his attention to pictorial mosaics made up of small cubes of coloured enamel, Mr. Paton pointed out that mosaic is the most powerful decorative medium which has ever come into the hands of the artist. The practice of mosaic-working is one of high antiquity. It came into extended use at the most interesting stage of human progress, and therefore its history had intimate relation to a subject of the deepest import to mankind—the introduction and the early growth of the Christian religion. Mosaic-working was a costly and difficult art, requiring on the part of its successful practitioner very high artistic and technical skill; but, when composed and properly fixed, a mosaic picture was practically unchangeable and imperishable. The fundamental condition in the employment of a medium so potent was that it be used with moderation, sobriety and reticence, the risk of a mosaic being that it might dazzle more than permanently delight.

TRADE NOTES.

THE Navy League Training Home, Liscard, Cheshire, is being fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd, engineers, Liverpool, who have also in hand the ventilation and hot-water supply.

THE new board schools, Trefriw, North Wales, are being warmed and ventilated by means of Shorland's patent Manchester stoves, Manchester grates, exhaust roof ventilators and inlet tubes, by Messrs. E. H. Shorland & Brother, of Manchester.

A VERY large clock has been erected in the tower of the new buildings for the Royal Masonic Institutions for Boys, Bushey. It shows time on four dials each 8 feet across, chimes the quarters and strikes the hours. The clock has been made to the designs of Lord Grimthorpe by John Smith & Sons, Midland Clock Works, Derby, who have just received instructions to make a large clock with four dials for the Harbour Trustees' Offices, Swansea.

FORD'S SILICATE OF LIMESTONE PROCESS

IN March of last year we were able to give some particulars of a new system, the invention of Mr. Lewis P. Ford, for the manufacture of an artificial building stone of high quality. During the interval which has elapsed since then various experiments and improvements have been made, the stone has been subjected to tests and analyses by experts, from which has successfully emerged, and it is now ready to be put on the market. In connection with the annual meeting and banquet of the National Federation of Building Trade Employers at the Trocadéro, Mr. Ford has opened in the adjacent premises 28-30 Shaftesbury Avenue, show-rooms where may be seen specimens of the stone in various forms, as slabs, blocks, bricks, carved work, a font, &c., from an examination of which an opinion may be formed of the value of the invention. The only ingredients used are pure silicate sand and a small proportion of lime; specimens of excellent quality are shown made from the tailings of the Johannesburg mines, others from sand from Leighton-Buzzard, Glasgow, Birmingham, &c., and all is found equally suitable. Indeed, it is claimed that wherever sand exists works can be set up and stone and (which is perhaps of more significance) bricks manufactured at the minimum of cost. The many advantages that Mr. Ford maintains his stone possesses include its cheapness, durability, immunity from climatic and atmospheric deterioration, its fine colour and texture and its facility for working. The little exhibition at Shaftesbury Avenue will remain open for a few days longer and Mr. Ford will no doubt be pleased to receive visitors and explain to them the manifold merits of his invention.

RETEMPERING CEMENT MORTAR.

IN the construction of the Manhattan Railway Company power station at Seventy-fourth Street and East River, New York City, during the past two years, about 40,000 barrels of cement were used, all of which was carefully inspected, over 3,500 briquettes being made and broken. In the course of the work several special investigations were made, which are described in a paper by Mr. Thomas S. Clark, resident engineer in charge of construction of the power station, printed

Cement and Engineering News for October, from which the following paragraphs have been taken:—

It is to be regretted that the practice of retempering Rosendale cement mortar after it has lain in the masons' tubs over the noon hour is a frequent practice by builders in New York City. It is not a question whether a wall built with retempered Rosendale cement mortar will fail or not, but it is a question of getting the best wall for the money expended. To prove to the satisfaction of all concerned that Rosendale cement mortar is injured by retempering after sixty minutes the experiments shown in the table were made. All briquettes in like sets of same brand were made from the same bag of cement and their treatment was exactly the same, except the retempering, which was done at the end of the hour, and enough water added, as in practice, to bring the mass back to its original consistency.

Effect of Retempering Rosendale Cement Mortars.

Tensile Strength.				
Hours in Air.	Age in Days.	Aver. No. of Tests.	Lbs. per Sq. In.	Remarks.
Neat cement; water, 28 % *

24	112	5	56	Retempered after 60 mins.

* Per cent. of water given is the initial wetting.

The same disastrous results were obtained even when the cement was moistened every fifteen minutes of the hour. Contractors have argued that if a little fresh cement is added the mortar is as good as it was originally. It is quite true that the strength is increased, but the old mortar must be considered as almost inert material. It cannot be supposed that the fresh cement has any life-giving effect

upon the particles of the old cement which has passed through the first stages of set. Builders may be able to point to walls where this practice was in vogue, but there is no question that the wall built where it was not allowed is the better wall, will endure longer and stand more shock. With several brands of Portland cement under the same treatment the machine used failed to show any injury done.

As with Rosendale cement, there must be a limit where retempered Portland will fail, and we are inclined to believe that it is somewhere within the second hour of standing. That the retempered Portland did not fail may be explained by the fact that the time of active set of Rosendale is shorter than that of Portland. The safest rule is to allow no retempering under any circumstances.

It is safe to assume that concrete a little too wet is oftentimes better than that which is too dry, especially when laid in warm weather, but when forced to lay Portland concrete in freezing temperatures the least possible water used the better.

In order to determine roughly the relation between the tensile strength of neat cement, cement mortar, stone and cinder concrete and its so-called modulus of rupture when acting as a beam under a concentrated centre load, briquettes and beams were made, the latter with rectangular cross section, using the same cement and aggregate for like sets and subjecting them to exactly the same treatment. After breaking the briquettes by direct tension, and the beams by cross-bending, it was found that the substances mentioned showed, on a fair average, that the modulus of rupture of cross-breaking was about one and one-half times greater than the strength in direct tension.

The fracture in the beams often showed the place of rupture passed directly through the stones of the aggregate, so the strength of the stone was largely a factor of the strength of the beam.

It has been decided to build a mission church for the Hob Lane district of the parish of Turton, near Bolton. The proposed building will take the place of the Board school, in which services have been held in the past. The mission church will accommodate about 250 persons, and will be placed on a site given twenty-three years ago for this purpose. Towards the cost of erection, estimated at 1,200l., a sum of 610l. has been raised by a bazaar held last October. The new church will provide for a population of about 950.

MATTER-OF-FACT MANCHESTER.

ONE need not be a "canting dilettante" to desire some mitigation of the arid wastes that environ Manchester, of the desolate areas of coal dust and refuse that are within its borders, and of the wretched dwellings that persist through all the efforts of philanthropy. If the commercial and industrial problems were settled absolutely and satisfactorily, greater problems would remain. How are beauty and nobility of life to be made possible for those who live under the conditions imposed upon so many of our fellow citizens? How can they whose material existence is so disordered find compensation in the things of the mind? There are many men in Manchester distinguished for philanthropic works; and one of them, Mr. Charles Rowley, the friend of William Morris and of Ford Madox Brown, speaks with particular authority. In answer to a very general inquiry he writes:—"We hold our own in spite of too much beer and our neglect of specialised education. I can look back fifty years, and having been in the rough and tumble of it all the time, I can assert confidently that there is a change amounting to a revolution for the better in nearly all the conditions of labour—better sanitation, better houses, a lower death rate, fewer hours of work with more wages, and a quite remarkable and rational spending power. The blot is the destruction of the pure country, and the incessant dirt."

There is no great central site of which one may say, "This is Manchester," and if the city were to be burnt down after the fashion of Chicago the citizens would certainly attempt some unity of design in the concentration of public buildings in suitable relation to open spaces. Manchester is matter of fact, utilitarian; it has not concerned itself with architectural fripperies, and when the inhabitants are questioned about their town hall they will tell you how much money was spent on it. If grandeur is attained it is rather through the great volume of effective labour than in anything that appeals to a sense of history or romance. The streets are thronged with workers, with "lurries" creaking under their loads of "greys," and with the heterogeneous combinations of persons and things that are common to large manufacturing towns. It is difficult to differentiate in the general appearance of things. Glasgow and Liverpool have their docks, Manchester, it is true, has its Ship Canal, but its characteristic is rather the central mass of warehouses crammed with goods on the cheapness of which the existence of the community depends. It may seem a

despicable virtue, this virtue of cheapness, but the Manchester man must frankly acknowledge that the future of his depends on it.—From the *World's Work* for February.

EPPING FOREST.

IN their annual report, which is just published, the Epping Forest committee of the City Corporation state that during winter of 1901-2 the thinning operations were very light. In some parts of the forest the birches were too numerous to develop properly, and in other places they were destroying holly, which is one of the features of the forest. The portion of the domain where thinning operations have been carried out are part of Theydon coppice, land adjoining the Copped Hall estate, part of High Beech, south of Earl's Path, Loughton, south of Manor Road, Loughton and part of Lord's Bushey. Reference is made by the committee to the work of enlarging the Hollow Pond, Leytonstone, which is being carried out at a cost of 1,800*l*. The Urban District Council of Walthamstow subscribed 300*l*, and Mr. E. N. Buxton, one of the verger-guards, guaranteed the same amount. The committee subscribed 600*l*. from the capital account, and the balance was taken from the City's cash. The work of restoring the beautiful tapestry belonging to Queen Elizabeth's Lodge at Chingford has been completed by M. Briquolas, an expert, and the tapestry has been placed in prominent positions in the lodge. With a view to meeting certain objections of the players on the golf course at Chingford, the rules and regulations and the fees payable have been revised. Three years ago Sir Edwin Durnford, M.P., with the consent of the Conservators, erected a granite drinking-fountain in the forest, and the committee regret that the donor has since handed over to them 100*l*. towards the cost of the water supply. The committee, after referring the gift by Mr. Gerald Buxton of the greater portion of the Common and the waste land along Ivy Chimnies Road, expressed regret at the fact that the Corporation did not adopt the suggestion that the 800 acres forming parts of Hainault Forest should be purchased for 10,000*l*. The accounts show that 3,000*l*. was received last year by the sale of thinnings, 583*l*. from licenses and tolls and 380*l*. from boating on Connaught Water, the Perch and Heronry Ponds and the Hollow Pond.

VALUE OF HOUSES AT HYDE PARK CORNER.

ON Monday Mr. Undersheriff Burchell and a special jury heard the case of Elliott's Trustees *v.* the Great Northern and Brompton and Piccadilly Railway Company, a claim for nearly 40,000*l.* compensation in respect of the compulsory sale to the company of the two freehold residences, 6 and 7 St. George's Place, Hyde Park Corner, and for damage done to the adjoining four houses in the same ownership, by the opening of a railway station on the site of the two houses. In opening the case, Mr. Boyle said the houses overlooked Hyde Park and afforded a fine view of Rotten Row, and were substantially built and well arranged. They were let on leases at 480*l.* per annum each, or 960*l.*, and were undoubtedly worth a much higher rental as they occupied one of the most fashionable positions in the West End. The rental being so well secured should be capitalised on the 3½ per cent. tables, 31-years' purchase, or 29,760*l.*, to which the customary addition of 10 per cent. for compulsory sale should be made, 2,976*l.*, bringing the amount for the property actually taken to 32,736*l.* The remaining residences could not fail to be seriously depreciated by the proximity of the tube station, with its noise and smell and crowds of passengers, and in respect of such depreciation about 6,000*l.* was claimed. The first witness was Mr. E. H. Bousfield (senior partner in the firm of Edwin Fox & Bousfield), who stated that the houses were worth 31-years' purchase of the present rentals, which amounted with 10 per cent. for forced sale to a total of 32,736*l.*, to which he added 15 per cent. of the value of the remaining four houses, representing 6,649*l.*, for depreciation. His total was thus 39,385*l.* It was almost impossible to obtain first-class freehold residences in that part of the West End. By the opening of a tube station the property would be entirely changed in character. Mr. W. H. Elwell capitalised the total rental of 960*l.* at thirty-years' purchase, and added 10 per cent. for compulsory sale and 6,000*l.* for depreciation of the four adjoining houses. Mr. J. J. Boyd (Grogan & Boyd) and Mr. J. H. Townsend Green (Weatherall & Green) were the other experts for the claimants. A consultation took place between the learned counsel, and the case was settled, it being agreed that the claimants should receive the sum of 30,750*l.* for the freehold of the two houses and all such rights as they

possessed over adjacent land shown in the notice to treat. Mr. Douglas Young (vice-president of the Auctioneers' Institute), Mr. Alexander R. Stenning and Mr. Leslie R. Vigers (members of the Council of the Surveyors' Institution), with Mr. George A. Wilkinson, were among the experts retained for the railway company.

RURAL DRAINAGE.

THE paper by Mr. H. T. Scoble on "Rural Drainage and Sewage Disposal," read at the previous meeting, was discussed at the Surveyors' Institution on Monday. Professor Robinson said it was of the utmost importance that all drains should be subjected to the water test, and he was strongly of opinion that the water-carriage system would prevail. The dry-earth or conservancy system he held to be attended with great risk to the health of the community, however carefully the disposal of sewage might be conducted. The requirement of the Local Government Board for land purification in the proportion of an acre to a thousand population could be modified with proper safeguards. There was no matter for dogma in this or in regard to bacterial treatment; each method was capable of being used under skilled advice, and every case must be governed by its surrounding conditions. Mr. Roehling, agreeing with many of the remarks in the paper and deploring the waste of manurial matter, was not in accord with the remedy proposed by the interposition of an expensive and elaborate intermediate process before disposing of sewage on land. There was no necessity for this treatment; land would do all that the bacterial process would do. Mr. A. R. Stenning referred to the difficulties attending the disposal of sewage in small rural villages. For disposing of excreta there was nothing better than the earth treatment, but difficulties arose in connection with sink water. The question of rural sewage was inseparably connected with water supply, and these difficulties had to be met. Dr. Poore severely condemned the sewage system. He formerly lived in the Thames Valley, when the rates were 4*s.* 2*d.*, but the local authorities in ten years borrowed 133,000*l.* for the construction of sewers, raised the rates to 8*s.* 2*d.*, and had created a filthy quagmire in the middle of the place. He described the system he had followed with success at Andover. For many years he had dealt with the sewage from 100 people living in old cottages. He had shown by his method that excreta should be buried

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Shutes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and Country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—the Anchor.

just below the surface, and rightly carried out this could be done quite near the house, without offence to the senses. He could not see why this system should not be adopted piecemeal in rural villages with an equitable adjustment of a sanitary rate. For the cost of sewers there should be a tax on water-closets. Mr. Beken, Mr. C. J. Mann, Mr. A. J. Martin and Mr. E. W. Booth continued the discussion, and Mr. Scoble replied, defending his view that the proper method to pursue was to purify the sewage and make use of the effluent.

NEW COUNTY ASYLUM FOR LEICESTERSHIRE.

A SPECIAL meeting of the Leicestershire County Council was held on Wednesday at the County Assembly Rooms, Leicester, to consider a report of the asylum committee recommending the provision of a new county asylum at Narborough at a cost of 241,278*l.*

Mr. R. Pochin, in moving the adoption of the committee's report, reviewed the efforts which had been made to provide the county with more efficient asylum accommodation. He pointed out that in 1897 a new asylum was recommended to be built at a cost of 140,000*l.* The finance committee reduced that amount to 120,000*l.*, and the Council authorised the visiting committee to recommend a site. At that time it was thought the asylum might be erected for about 200*l.* per bed. Upon that basis the committee arrived at the estimated cost of 140,000*l.* The demand of the Lunacy Commissioners had now largely increased. In all modern asylums increased accommodation had to be made in administrative buildings for extensions of patients' buildings, and that had been one of the chief causes for the abandonment of old asylums, necessitating entirely new buildings. The estimated share to be provided in the first instance by the Council in connection with the scheme was 208,692*l.*, after deducting the amount payable by the county of Rutland and the Charity, and exclusive of the share of cost of the site, which had already been borrowed. If the money could be borrowed at 3½ per cent. the cost to the county rate would be about 2½*d.* in the pound. Turning to the question of retaining the present asylum and building a smaller one at Narborough, they were advised that a sum approaching 40,000*l.* would have to be expended on the old asylum to make it a suitable institution for the requirements of the present time. In their judgment, they believed that a sum of from 2,000*l.* to

3,000*l.* would be saved annually to the county by the adoption of the scheme for one asylum instead of two.

The report was adopted without a division, and it was decided to apply to the Local Government Board for a loan.

AN AUSTRALIAN CONTRACT CASE.

IN the Supreme Court of Brisbane (Queensland), before Mr. Justice Real and a jury of four, there was heard, from November 17 to November 24, a case in which Felix Edward Barbat, a contractor, sued Richard P. Vincent for an amount alleged to be due for work done and goods supplied in connection with the erection of the railway workshops and power-house at Ipswich. The total amount originally due was 16,221*l.* 19*s.* 2*d.*, but the defendant had paid on account 14,625*l.* 19*s.* 11*d.*, leaving a balance of 1,595*l.* 9*s.* 3*d.*, which the plaintiff now claimed. The defendant, in his statement of defence, alleged that plaintiff had overcharged him for steel supplied to the amount of 410*l.* 12*s.* 6*d.*, and that amount he claimed to be entitled to deduct. He also disputed other items of the plaintiff's claim, and paid into Court 668*l.* 1*s.* 1*d.* as more than sufficient to satisfy the whole of the plaintiff's claim.

One of the claims of the plaintiff was for 90*l.* 6*s.* for the supervision of work, but plaintiff in his evidence said there was no actual agreement between himself and the defendant that he should be paid for services rendered for that purpose, but the work having been done he had charged what defendant would have had to pay if he had engaged a foreman. His Honour expressed the opinion that this sum could not be recovered, and in deference to that view plaintiff abandoned that claim. Evidence was given by a former inspector of ironwork at the Ipswich railway workshops for the railway commissioner as to the quantity of ironwork done by the plaintiff in connection with the contract.

The following were the questions put to the jury by the Judge, and the answers given.

1. What was the agreement between the plaintiff and defendant, as to the price which defendant was to pay and plaintiff was to receive for the due performance of the work done by the plaintiff in connection with the waggon and carriage shop, labour and material, &c.?—22*l.* 10*s.*

2. How much do you find the plaintiff was entitled to receive from defendant for the due performance of his contract with respect to the waggon and carriage shop?—1,438*l.* 11*s.* 7*d.*

3. Did the work which plaintiff agreed to do for the sum of

400l. in connection with the gantry girder include the brickwork and concretework?—No.

4. What was the fair value of the work done by the plaintiff for defendant in connection with the said gantry girder and not included in his contract?—20l. 11s.

5. How much was the plaintiff entitled to receive from defendant in connection with the boiler shop?—847l. 4s. 7d.

6. What sum, if any, is due from plaintiff to defendant for interest in pursuance of their agreement in connection with the waggon and carriage-shop contract?—Six per cent., say 153l.

7. How much is defendant entitled to by way of credit in addition to credit given by the plaintiff?—39l. 18s.

8. What balance do you find due from defendant to plaintiff without taking into consideration the amount paid into Court?—1,266l. 2s. 3d.

His Honour entered judgment for the plaintiff for 1,266 2s. 3d., including the sum of money paid into Court. By consent and at the request of the parties, the time occupied in the hearing of the issues and the matters in respect of which the defendant succeeded he estimated as one day, and gave judgment for the plaintiff with costs of the action as if it had occupied two days less than it actually occupied. He excepted the costs occasioned by the claim for 90l. 6s. (abandoned on the third day of trial), and in respect of such claim gave judgment for the defendant for the costs occasioned thereby, such last-mentioned costs, however, not to include any costs of hearing except witnesses' expenses for the first two days, defendant to be entitled to set off his costs in respect of such claim for 90l. 6s. against such costs as the plaintiff was entitled to in the action.

ELECTRIC LIGHTING OF ABERDEEN.

THE new works which the Aberdeen Town Council are erecting at Dee Village are now practically completed, and will very shortly be ready for inspection by the municipal body on the invitation of the gas and electric-lighting committee. For the following exhaustive description of these works we are indebted to the *Aberdeen Free Press*. The buildings have been arranged to allow of extension in an easterly direction, as the demand for electrical energy increases. They at present consist of a boiler-house, engine-room, battery-room, economiser-house, pump-room, offices, stores and test-room, also workmen's mess-room and chimney-stalk. The boiler-house, which has a frontage to Dee Village Road of 137 feet and a width of

82 feet between walls, is spanned by three iron roofs, having louvre ventilators and large roof lights extending the whole length of the house. The central roof is at a higher altitude than the other two, and will cover an overhead coal hopper, which is to be carried upon substantial steel stanchions and compound girders. The coals are to be raised to the hopper by means of electrically driven elevators and conveyers. The stoking floor is upon a level with the roadway, and under it is a sub-floor, to which the ashes from the boiler furnaces are dropped and thence removed. The boilers at present installed are six in number, and are of the Babcock & Wilcox well-known water-tube type, each capable of evaporating 15,000 lbs. of water per hour, and fitted with super-heaters and electrically-driven chain grate stokers. The present building is capable of accommodating other eight boilers of equal dimensions, and when complete will contain an aggregate of about 7,000 horse-power. The main flues, leading from the boilers to the chimney-stalk, measure 11 feet high by 7½ feet in width, and are arranged at the back of the boilers, alongside the walls of the building; they are then led through the economiser house, in which are two sets of Green's economisers; each set consists of 480 tubes, around which the flue gases from the boiler furnaces circulate on their way to the chimney, and through the inside of the tubes is pumped the feed water to the boilers; the water thus attains a high temperature before entering the boilers, and therefore effects a considerable economy in fuel.

The chimney-stalk is 210 feet in height, and has an external diameter of 26 feet at the ground level, tapering to 16½ feet at the neck ring; it then opens out in bell-mouth fashion to an overall width of 21 feet at the cope. The internal diameter of the chimney is 14 feet, and is almost parallel throughout. It is circular in form, and while one cannot speak of it as a thing of beauty, it is, nevertheless, a piece of superior workmanship, well proportioned and very efficient. The bricks, of which there are about 500,000, were made at Strathathie, and the weight of the chimney is computed to be about 3,500 tons, based on a substantial block of concrete 40 feet square. There is a 24-inch cast-iron pipe led up the inside of the chimney to carry off the exhaust steam from the engines when they are running non-condensing, so that there is no nuisance in the neighbourhood due to condensation of steam, as is sometimes experienced in the vicinity of such works. Over the economiser house, and in reality forming the roof of it, is a cast-iron water tank, 51 feet long by 39 feet wide and 5 feet deep, capable of

holding about 60,000 gallons of water, which is used for condensing purposes; the water is pumped up from the river Dee through an iron pipe laid along the concrete culvert which conducts the Ferryhill burn through the site of the works and down to the river. The pumps are of the centrifugal type, and are placed in an underground chamber built near the river bank, and driven by electric motors controlled from the works.

The boiler-feed pump-room is a brick-built apartment contained within the boiler-house; the walls are lined on the inside with glazed white tiles throughout, and within this house are erected two of Weir's patent vertical direct-acting steam pumps, each capable of delivering 4,000 gallons per hour when working at a speed of twelve double-strokes per minute, against a boiler-pressure of 150 pounds per square inch. The water used here for feeding the boilers is supplied from the Corporation mains, and is pumped from a commodious water-storage tank constructed of concrete, and which is situated directly under the pump-room floor. The engine-room lies parallel with the boiler-house, and has a frontage to Millburn Street of 126 feet, and is 62 feet wide inside. The walls are lined with glazed white tiles, which, together with the large windows on the south wall and the light admitted from the roof, give the building an exceedingly bright and handsome appearance. Five engines are installed, four of which have been running more or less since December 1901. There are two of 300 horse-power each, coupled direct to Messrs. Mavor & Coulson's dynamos, one of 300 horse-power coupled to Messrs. D. Bruce Peebles & Co.'s dynamo, one of 700 horse-power coupled to a Johnson-Lundell dynamo, and one of 700 horse-power coupled to a Westinghouse dynamo. All the engines are of Messrs. Williams & Robinson's well-known high-speed central valve type, and the dynamos are all suitable for either lighting or traction. The whole of the traction load for the tramways has been supplied from these machines since the month of June last, as well as a portion of the lighting. Surface condensers are used in conjunction with the engines, and these have been supplied by Messrs. Alley & MacLellan, of Glasgow. The air-pumps and the circulating pumps are driven by electric motors. The condensers, as well as the air and circulating-pumps, are placed in a sub-floor below the level of the engine-room.

There is at present installed in the engine-room a 120-kilowatt balancing set, the purpose of which is to compensate for fluctuating loads, and maintain an equal voltage on both sides of the three-wire system of distributing mains. The

temporary switchboard in the engine-room is fully equipped with the necessary ampere and voltmeters and other delicate instruments, which are mounted on teakwood slabs. All these instruments are to be fixed upon marble panels to form the permanent switchboard, the erection of which is now being rapidly proceeded with. The switchboard gallery, along the south side of the engine-room, is constructed of steel joists, and the floor is composed of glass lenses in cast-iron frames; the glass stands above the iron frames, and thus forms a perfectly insulated tread, and at the same time does not reduce to any appreciable extent the light below the gallery, and has the further advantage of being incombustible. A 20-ton electrically driven crane, made by Messrs. J. Carrick & Sons of Edinburgh, spans the engine room, and makes it possible to handle the heavy machinery with ease. A gallery is formed at the west end of the engine-room, giving ready access from the offices to the switchboard platform and the boiler-house.

At right angles to the engine-room, and facing Crown Street, is the battery-room, which measures about 100 feet in length and 45 in width. The floor is laid with terra-cotta tiles, and the walls are rendered with cement dado, with plaster above. It is bright, lofty and well-ventilated, and contains two complete storage batteries of 128 cells each, together capable of giving a discharge of 2,200 ampere hours at 440 volts. The batteries were supplied by the Electrical Power Storage Co. Ltd., of London, and have been in operation during the past fourteen months. At the south end of the battery-room is what is called a booster set for charging the storage batteries and raising the town pressure sufficiently to overcome the internal resistance of the cells. The set consists of two dynamos actuated by a 100 horse-power motor. The block of buildings, of which the battery-room occupies the ground floor, is a two-storey one with a basement floor, in which there are commodious cellars—the natural formation of the ground lending itself admirably for the provision of sub-floors throughout. Above the battery-room are the test-room, staff-room and lavatories, also the station engineer's and manager's rooms, which have each a large oriel window immediately overlooking the engine-room.

It should be stated that in arranging the buildings due consideration has also been given to the comfort and convenience of the workmen. On the ground floor to the south of the main block is bath-room and lavatory accommodation, and a room which will be fitted with a gas cooking-stove.

To the south of the battery-room block and adjoining it are

the offices, with a frontage to Millburn Street, where accommodation is provided for a checker and weigher, clerks, draughtsmen, and also a waiting-room and book store. The block is a three-storey one, and is surmounted by a flagstaff, which stands 100 feet from the level of Millburn Street. This building, with the engine-room, which both face Millburn Street, are undoubtedly an acquisition to the architecture of the neighbourhood. The dressings throughout are from Kemnay Quarries, and the rustic ashlar from Rubislaw. The contrast in depth of colour from this combination is very effective. The buildings are entirely of granite, and are built in a substantial manner. The site of the works will necessarily look in a somewhat rough condition until the buildings are carried out to their full extent, which, however, will not likely be for a few years. The vacant piece of ground fronting Crown Street was reserved for a workshop and car repairing dépôt, but nothing meantime has been settled regarding this. The boiler-house and engine-room, when extended other 126 feet towards Wellington Road, will contain plant capable of developing about 15,000 horse-power.

MUNICIPAL WORKS IN BRADFORD.

A COMMITTEE of the Corporation was lately formed in Bradford for the purpose of inquiring into the formation of a works department on the lines adopted in London and other places. A deputation visited London, West Ham and Battersea in order to report on what was being done there, and make a recommendation as to what line of action the Bradford City Council should adopt. The deputation has just completed their labour and presented their conclusions. There are two reports, one signed by Alderman Vint and Councillor H. H. Spencer adverse to the establishment of a works department in Bradford, and another signed by Mr. Tuke Priestman favourable to such a scheme.

In their report Messrs. Vint and Spencer state:—

"The London County Council works department, which we first visited, has been in operation since 1892. All engineering and architectural works decided on by the Council are estimated for by the Council's engineer or architect, from their knowledge of current prices, and are offered to the works department at that estimated price. If the department accepts the contract, the work is carried out by the department. If not, the work is put up to tender and executed by the successful

contractor. . . . Our observation led us to think that the work of the contractors was equal to that of the works department." The report proceeds:—"On the question of wages, both at the County Council and Battersea, it was most strongly insisted on that trade-union wages and no more were paid. The managers were instructed that they were to consider themselves fully in charge of their departments as they would be in private works, and to show that there was to be no interference we were told that Mr. Burns, Mr. Taylor and Mr. Crookes, three labour members, had particularly refrained from sitting on the works committee. Generally speaking, we found that the works department was unable to compete in price in architectural work with the outside contractor, but could do so in underground engineering work; that we had no proof that the work was better done by the works department, and that wages and hours were the same under both." As to the West Ham works department, the deputation found that while trade-union wages were paid certain other special privileges and payments were made, namely, a sick fund, holidays with pay, and an arrangement that whenever at union rates a man's wages did not amount to 30s. a week they should be increased by not exceeding 2s. a week. These payments were not charged to each job, but a special note was kept, and the general rates were charged with them. Generally speaking, they found the departments worked with a great deal of enthusiasm and a desire for their success. The deputation made inquiries as to the effect that the multiplication of municipal workers had in regard to their votes at elections. In London and Battersea they were told that it was a negligible quantity, whereas in West Ham they were told (which was also denied) that the municipal employes would always vote for the men who would make them into a specially favoured class. The proportion of municipal employes was very much smaller to the population than in Bradford. In conclusion, the report states:—"We are compelled to report that we do not consider it advisable to establish a works department in Bradford. From what we saw we do not think that such a department could compete with the private trader; we also think that in cases where the Corporation can do so, the work will be done more economically and with much less friction between committees by the committees responsible undertaking the work. Perhaps the nearest approach we have in Bradford to a department for supplying the needs of the other committees is the Team Labour Department, and in this department we find just the same result as in West

Ham—that whereas the Team Labour Department to compete with outside teamers has to supply horse, cart and man at 8s. per day, the actual loss last year was 1,122/”

In the course of his report Mr. A. Tuke Priestman (the Socialist) says:—“The works committee in the past appears to have been one of the principal battlegrounds of the contending parties, and its non-success financially, so far from being inherent in the system, was only what was to be expected under the circumstances. In Bradford, however, extensions of municipal enterprise, though strenuously opposed at first—as, for example, our trams—have, when once adopted, always received the hearty assistance and support of the members of all parties in the Council; the principal difficulty with which the L.C.C. works department has had to contend is therefore absent as regards Bradford. . . . We had an opportunity of seeing, and in most instances examining, a large number of buildings of different classes erected by the departments. These included artisan dwellings, pumping station (in course of erection), large public baths and washhouse, fever hospital, electricity generating station, coroner's court and mortuary, &c. The workmanship in every instance appeared to be of the first class. There can, therefore, be no doubt as to the ability of a department managed by a local governing body to turn out satisfactory work of any description which may be called for from it.”

URALITE.

THE American Consul-General at Coburg has sent a report to his Government on Uralite. Describing the manufacture, he says:—The process commences in what is known as a “preparation building,” where the crude asbestos is first of all “teased” out and freed from sand and other foreign substances. It is carefully graded and separated and passes on to edge runners, where a small portion of whiting is added to prevent grinding rather than the loosening of the fibres which is desired. From the edge runners it is conveyed by elevators to a floor above, where it is fed into a Krupp disintegrator, which further loosens the fibres. It is again separated by air blasts and by sieving, and is then ready for the next stage. In another building the asbestos is mixed with an equal weight of whiting, if white uralite is being made; or if grey or red uralite is needed this is replaced by carbon black or red oxide. The whiting is first reduced to a cream by beating it up with revolving paddles in a mixer. This is passed through a sieve

for the removal of accidental impurities, and thence into “hollander.” The asbestos is next added, the usual charge being 5½ cwts., and then the colouring matter. The whole worked up into an emulsion by revolving screws and beaten for a quarter of an hour or so, and there is a further separation to remove any sand which may have hitherto escaped detection. The uralite pulp then passes to a machine designed on much the same lines as that employed in making paper boards. The pulp is delivered over riffle boards on an endless revolving blanket, and passing through a series of rolls is partially dried and compacted. It then passes on to a revolving drum at the end of the machine, on which some fourteen or fifteen thicknesses are deposited before the required thickness is attained, this point being signalled by a flash from a red incandescent lamp above. During the process of winding on to the drum a solution of sodium silicate, with a small amount of sodium carbonate insufficient to permit of the immediate deposition of the silica, is passed over the successive fibres of asbestos, and serves as an adhesive.

The large sheets, as they are taken from the drum in the pliable state, are quickly cut to smaller ones, measuring 6 feet 2 inches by 3 feet 1 inch. These sheets are piled up, alternating with sheets of wire-gauze or sheet-iron, to a height of about 40 inches. The pile is then placed under a hydraulic press and the pressure slowly increased, so that at the end of half an hour it is equivalent to about 200 pounds per square inch. This is maintained for 1½ hours, and the pile is then left to harden for 24 hours, after which the sheets are removed to go to the storing-rooms. Here they are placed vertically in racks on trucks and pass through a series of stoves with graduated temperatures. The stoves are gas-fired. They are then steeped in a solution of sodium silicate, washed, left to dry, and again passed through a stove, after which they are steeped in a solution of sodium carbonate, and washed and dried as before. These subsequent operations are repeated as often as required for the final hardening of the sheets, and the entire process occupies several days. The sheets are stacked for some days and again passed through the stove, being then ready for use, though I understand that, like timber, they are the better for a little seasoning. The sheets of uralite thus produced are found to be uniform in thickness, three thirty-seconds of an inch being the standard.

Uralite in its present form is the result of protracted research, experiment and tests, and I was on the occasion of my visit to the works enabled to witness a somewhat unique

demonstration of its fire-resisting and other qualities. I understand, by the way, that tests carried out by the British Fire Prevention Committee have already thoroughly established its reputation with that important organisation. In the tests carried out on the day of my visit to the works I was given a confirmation of these results. Three principal tests were made, and they fully proved that uralite possesses the following qualities:—(1) The material is able to withstand intense heat for a long time without disintegration; (2) its non-conducting powers are uniform throughout; (3) it is capable of entirely preventing the passage of flame from any room where fire occurs; (4) after prolonged exposure to fire it is able to resist water without serious damage; (5) exposure to changing atmospheric conditions does not affect it, and (6) all the materials employed in its manufacture possess substantially the same chemical, physical and thermal constants. It is claimed that no other material fulfils all these conditions.

The uses to which uralite can be put commercially are many. It will probably find its widest field of service in the building trades, and it appears that it should prove equally valuable whether the buildings are of a temporary or permanent character. Owing to its extreme non-conductivity, huts, railway carriages, barracks, hospitals, &c., constructed with it, while absolutely fire and water-proof, are warm in winter and cool in summer. A room covered (walls, doors, ceiling and floor) with uralite three thirty-seconds of an inch thick might have its contents burned, it is claimed, without any danger of the fire spreading. Another great advantage is that immediately after the work is finished the room can be occupied, no time being required for drying as in the case of plaster. The fire-preventive qualities make the material invaluable for warehouses, particularly when these are filled with inflammable materials, since with uralite partitions a fire can be confined to the one compartment in which it originated. For partitions light wooden framework only is required, with sheets of uralite fixed on both sides, or it can be affixed to match-boarding.

THE HOUSING PROBLEM IN GLASGOW.

THE manager of the city improvement department of the Glasgow Corporation, Mr. William Menzies, gave evidence before the Municipal Commission on the Housing of the Poor. The *Glasgow Herald* says that, in his opinion, the tendency of the population is to migrate from the rural districts into the

crowded urban centres. A comparison of the last two census returns showed that the town-dwellers in Scotland—covering only towns of over 2,000 inhabitants—had increased from 2,925,000 in 1891 to 3,367,280 in 1901, or by 442,000—equal to an increase of over 15 per cent. in ten years. During the same period the rural population had increased by 4,153 persons—an advance on the numbers recorded in 1891 of slightly over one-third, or 1 per cent. The county census included towns numbering less than 2,000, and it also included large suburban areas which were almost entirely occupied by citizens engaged in business in the large cities. He quoted as an explanation of the genesis of the frightfully congested and insanitary areas which required the scheduling and demolition, under the Glasgow City Improvements Act of 1866, of 88 acres in central Glasgow, inhabited by over 75,000 persons previous to that year, a paper read by Sir Samuel Chisholm before the Royal Philosophical Society of Glasgow in 1894.

Witness then gave some particulars regarding the work carried on under the City of Glasgow Improvements Acts of 1866 and 1897, since the date when he was appointed manager of the department. Under these Acts 1,269 houses had been demolished since 1891. The houses were of the following size:—692 one-apartment houses, 507 two-apartment houses, 70 larger houses. Regard for the health of the citizens and the necessary preparation of the ground for the erection of the new buildings, which, so far as these have been undertaken by the Corporation itself, were commenced in 1888, required that the insanitary and ruinous buildings in which most of the houses were situated should be demolished. The building policy of the Corporation was carried on continuously from year to year thereafter, requiring the previous demolition and clearance of each site which was to be covered. The houses demolished in eleven years were 692 one-apartment houses, 507 two-apartment houses, 70 three-apartment houses; a total of 1,269 houses.

He made himself intimately acquainted with all the houses included in both the earlier and latest schemes of demolition already referred to, and he could distinguish the following three classes among the occupants of these areas:—(1) A number of thrifty, well-doing people who would gladly be clear of their sordid surroundings and their bad neighbours. These people were held to their dwellings by poverty, the result of weakness, age or misfortune, and no doubt to some degree by the ties of association born of their long residence in the same house. (2) A large number of weak and thriftless persons, mostly living as sub-tenants of the house-farmer. The pre-

vailing vice of this class is a tendency to intemperance. If they have a house of their own, their drinking habits and thriftlessness prevent them keeping up the due payment of the rent, with the result that they become either the intermittent respondents to actions for ejectment in the Burgh Court or permanent victims of the house-farmer, tending all the time to fall into the "third" and most hopeless class. (3) A small percentage living in crime or on the borderland between it and an honest life.

If any areas are to be scheduled for demolition in the future, he should expect to find within them the same classes as he had described, with a larger relative proportion of the "first" class than had hitherto been found. Persons of this class would largely take advantage of the accommodation provided in a rehousing scheme, under these conditions:—(a) That the rents of the new houses be the same or but slightly higher than from those which they remove; (b) that the new houses be situated within one-half mile of their former residence; (c) that the provision of new houses be made a considerable time prior to the term at which they are to be dispossessed of their old houses. The "second" class would not so readily migrate into Corporation dwellings, but if others belonging to private proprietors were not available they would do so. The same difficulty would not be found in removing this class further from the site of their previous dwellings. The "third" class avoided going into any houses where order and the claims of good neighbourhood were rigidly upheld. These persons would not voluntarily be participants in the benefits of a rehousing scheme. They would not abide for any lengthened period in occupation of Corporation houses, even if by some pressure they were placed there. The only method, apart from the personal influence of the caretaker, available to the improvements department officers for enforcing good order among the tenants was the usual statutory powers of a proprietor. This was not sufficient to restrain people of the class spoken of, but was quite effective in sending them out of the houses. He regarded the minimum dimensions of dwelling-houses as authorised by the Act of 1892 to be too small for one and two-apartment houses. The Act requires the following minimum cubic space in small houses:—Dwelling-houses of one apartment, 1,000 cubic feet; dwelling-houses of two apartments, 1,600 cubic feet; dwelling-houses of three apartments, 2,400 cubic feet. He would suggest that the minimum to be allowed for single apartment houses, where the one apartment

is used as living, dining and sleeping room, should be at least 1,200 cubic feet. This would give a room 10 feet by 15 feet with an 8 feet ceiling, which is the minimum height of ceiling, and is only allowed in an attic storey. The minimum size of the two-apartment houses should, he thought, also be increased to 2,000 cubic feet, which would allow of a kitchen or living room being the same size as the single-apartment house, and in addition a bedroom of 800 cubic feet capacity, accommodating two adults. The erection of one and two apartment houses of less than the minimum dimension suggested would, in his opinion, tend to encourage overcrowding of houses. Builders had two paramount considerations in planning and building dwelling-house property:—(1) To provide a house which will let and yield a rent large enough to afford a good return on their capital; and (2) to erect a building which will be put at a good valuation, and so commend itself to the investor who has money to lend on mortgage. These considerations almost of necessity resulted in builders leaving aside the erection of low-rented houses for the poorer classes, and preferring to erect those which would yield the largest rent for the particular size of house built. The Corporation was not hampered by these conditions, and could build houses similar to those erected at Haghill and Baltic Street and let them at the same or lower rents. A charge upon the rates would be necessary during the period of construction, and until the houses were occupied and rent-producing. If after that the Corporation were able to borrow at 3 per cent, and agreed to repay the whole of the capital within sixty years by a sinking fund on the "terminable annuity system," the revenue drawn from the houses would be sufficient to cover the necessary outlays for management and upkeep, and also to provide for the annual payment of interest and sinking fund. If it were deemed preferable to establish a sinking fund on the "instalment system," by which one-sixtieth of the total capital would be repaid each year, and thereby secure in each succeeding year a corresponding diminution of interest payable, the charge in the early years of the scheme being the highest, the revenue from the property might have to be supplemented from the rates for five or six years. After that time the houses would show a profit, which would ultimately be very considerable.

He had not thus far dealt with common lodging-houses, but as sixty-seven of these establishments appeared upon the register, giving accommodation for 9,705 men and 577 women lodgers, account should be taken of them.

ARMoured FIRE DOORS

Telephone,
No. 143 Westminster.

Telegrams,
"Sprinkler, London."

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

Will NOT Buckle or Twist out of Shape.

ALSO MAKERS OF THE ARMoured URALITE DOORS. Full Particulars on Application.

**HOT WATER AND
STEAM HEATING INSTALLATIONS,
HIGH AND LOW PRESSURE. VACUUM SYSTEM.**

**GRINNELL AUTOMATIC FIRE EXTINGUISHING INSTALLATIONS.
FIRE PUMPS AND FIRE APPLIANCES OF ALL KINDS.**

And at Glasgow, Leeds, Birmingham, &c.

The Architect.

THE WEEK.

ONE effect of the new Licensing Act will be that every holder of a license must find it requisite to possess correct plans of his premises. They can be demanded by the magistrates, and if they are not produced without delay the granting of a license can be postponed. Under the new conditions magistrates are expected to be satisfied that structural alterations will not afford increased facilities for obtaining drink or of concealment during any of the inspections which will henceforth be more frequent. Should there be a suspicion of either the magistrates can decline to grant a license, or in case of alterations insist on the premises being realtered to their original state. If plans do not exist and are not forthcoming suspicion is likely to arise, and it will not be advantageous to the tenant. The sooner plans are made the better, and publicans should bear in mind that no mere general outline or sketch will serve. Every detail which might arise in the discussion over a license should be clearly presented. That is the conclusion which must be drawn from the addresses of chairmen of licensing sessions in various parts of the country.

THE late Vice-Chancellor MALINS was accustomed to announce how little he cared about the evidence of experts in light and air cases. He preferred when the buildings in question were not remote from Lincoln's Inn to examine the extent of the obstruction with his own eyes. Technical evidence in such cases necessarily varies, we might say, almost as much as judicial opinion. But the interpretation of legal questions depends to a large extent on the meaning given to words and is therefore uncertain, whilst the scientific problems involved in discussions being supposed to be based on mathematics and optics are presumed to have the utmost certainty. To determine the quantum of sky area shut out by a new building, to take the simplest kind, appears to a judge to be no less easily determined than the area of a field, and when he hears conflicting statements, or is shown geometrical diagrams which do not correspond, he is apt to come to the conclusion that somebody is endeavouring to take advantage of the Court's weakness in science. It is not to be expected that judges will confine themselves to the mathematical or optical aspects of a light and air case, but their lordships are impressed by evidence in which science is employed without being strained to meet a particular purpose. The book lately issued by Messrs. E. & F. SPON, in which "Obstruction to Light" is investigated by Mr. H. B. MOLESWORTH, M.Inst.C.E., affords an example of the class of evidence which is likely to prevail in courts. Generally speaking, it is assumed that light and air are constant in quantity and quality, and that light strikes from one point, although everyone must know they are variable. Mr. MOLESWORTH explains how by the aid of a planisphere or orthographic projection of a sphere far more precision in showing the obstruction of the sun's rays at different times can be secured. In the book this is done by means of very clear diagrams on a large scale, and without their help it would be impossible to furnish a clear account of the author's method. We consider his process to be worth studying by all who are likely to be called on to be witnesses in cases of obscurity through obstruction. The subject is one which has not been treated to excess, and for that reason mathematical contributions are desirable.

THE bay window offers so much relief from the monotony which prevails in the fronts of houses, it is no wonder people endeavour to preserve it at all costs. It has been made recently the occasion for determining an important point of law, and that is, how far official demands can override the stipulations of a lease. The case WRIGHT v. LAWSON came before Mr. Justice KEKEWICH. The defendant in 1888 entered into a lease for a house and shop in Fulham. He undertook among other things to uphold and maintain the premises. In 1900 he received a notice

from the London County Council ordering him to take down or otherwise secure the brickwork of the external walls and bay window, so far as cracked, bulged, loose, sunk, overhanging, out of upright or otherwise defective; also to shore up the bay window and arch over the back door immediately. The lessee obeyed; the window was taken down, but owing to the walls of the house being old and badly built it could not be re-erected without becoming a dangerous structure. A new window was formed in the main wall of the house. The lessor demanded that the premises should be restored to their original condition by replacing the bay window. That could only be done by employing columns or other supports beneath it. Mr. Justice KEKEWICH gave judgment for the defendant, who, he said, had been unable owing to the action of the London County Council to perform the work required. A new bay window resting on columns could not be considered as a repairing of the old one. The case will be found to have a wide application. Local authorities order many alterations which have the effect of imparting a new character to premises. Sometimes lessors will not recognise the new works or will insist on compensation. It is therefore an advantage to have the law on the subject once more laid down with precision.

THE results of the trials of uralite at West Kensington in last December demonstrate that even temporary buildings, when protected by sheets of the material, will resist flames for a sufficient time to enable any inmates or property within them to be removed without risk. When it is remembered that the retail price of uralite is less than 4d. per square foot, it is evident that immunity from danger can be secured without much expense. An ordinary deal door with two thicknesses of uralite was subjected to a temperature which at last reached 2,340° Fahr., and at the end of 30 minutes the uralite, although "porcelained," was still in position. Another door constructed with five thicknesses of uralite, two of deal, the inside being covered with armour, did not in 30 minutes allow the flames to pass. The outer part of the door was in perfect condition. A partition formed of six thicknesses of uralite and two of deal, with upright timber studding, was found to have the uralite next the fire porcelained, but the uralite behind this was in good condition, and the first layer of wood was somewhat charred. A platform was also tested as well as deed-boxes, with no less satisfactory results. Uralite deed-boxes are in request, and they have a special use for those who need to have protection for documents, designs, patterns, &c. The peculiar applicability of the material enables it to be used without elaborate preparations, and in consequence it may be said to be an indispensable adjunct for wooden buildings. It completely changes their character. It compensates for the consumable qualities of timber, and temporarily, as it were, imparts endurance under great heat to the material. At a time like the present, when there is so much anxiety on the subject of improved buildings, the advantages of this preparation of asbestos cannot be too widely known. In order to secure fire-resisting and fireproof doors that will be practically invulnerable, the British Uralite Co. have made arrangements with Messrs. MATHER & PLATT, Ltd., to make uralite doors at their large works, which are especially laid out for their production.

THERE has been a cessation of speech and writing in relation to the gold ornaments found in the North of Ireland and which were purchased by the Trustees of the British Museum. There is no doubt, however, that the Crown lawyers have not suspended their operations, and the subject has been formally brought under the notice of some of the officers of the High Court. In Ireland confidence is still prevalent that the examples will one day be restored. Mr. J. R. GARSTIN, the president of the Royal Society of Antiquaries of Ireland, referred to the controversy at the annual general meeting which has just been held. He demurred to the intervention of the Society of Antiquaries, especially as the official of the British Museum who bought those objects was the Secretary of the Society, and its President was one of the Trustees of the Museum.

"MUSIC."—By F. R. PICKERSGILL, R.A.

THE ARBITRATION CLAUSE.

IF a vote could be taken among lawyers respecting the arbitration clause, which is almost universally introduced in contracts for works of construction, there is little doubt a majority would be found in opposition to it in its present form. Such a mode of ascertaining opinion is, of course, impracticable. Lawyers know that the parties to a contract can set up a tribunal of their own for the arrangement of any differences which may arise, and the agreement once made there is no escape from it. On the other hand, it is realised that so much unrestrained power in the hands of an individual is sometimes liable to abuse. Besides, there is more or less of an anomaly in the fact that an architect or engineer, who is the paid representative of his client or clients, and whose personal interest is bound up with them, should in an emergency cease to be one-sided, and become as impartial as would be an outside arbitrator, or one of the judges of the High Court. In consequence of this view there has evidently been a desire whenever occasion offered on the part of judges to limit the powers claimed by the architect or engineer as arbitrator. For example, it is sometimes held that certain questions in a contract deed are of a legal kind and cannot be determined by any individual other than a trained lawyer. Or if a clause speaks of the manner of executing works and a dispute arises about the quantity executed the clause is not supposed to apply. Many other instances could be given, but the few we have mentioned are sufficient to indicate the tendency of the judicial mind in England.

The judgment which was delivered by Mr. Justice FARWELL a few days ago in the Chancery Division of the High Court is the latest instance of the endeavour to restrict the authority of the engineer or architect within their own province as superintendents of works. The plaintiffs in the case were Messrs. FOSTER & DICKSEE, contractors, and the defendants were the Mayor and Corporation of Hastings. The arguments arose out of an application for an injunction by the plaintiffs to restrain the defendants, or their officers, from acting under a notice given by the borough engineer on the 6th ult., by which the plaintiffs and their workmen were to be dismissed from their works and other persons employed to complete the contract at the cost of the plaintiffs. The contract was for works in connection with a supply of water to the borough of Hastings. It was entered into on December 31, 1898. Three wells were to be sunk and lined as part of the undertaking. Two of them were completed. There were some difficulties about the third well, and it was arranged that the original site should be abandoned. A supplemental agreement was entered into in July 1901, in which it was stated that the provisions of the original contract were to apply to the new works. After a depth of 58 feet had been reached, for the new well there was a sudden inrush of water. Not anticipating such a difficulty, the Corporation had hired out the most effective pumping machinery, and

the plaintiffs were therefore compelled to utilise pumps which were inadequate to the duty required. Delay was unavoidable. The engineer wrote in a friendly way asking the contractors if they could not expedite the work. The reply was that more effective pumping machinery was indispensable, and, owing to the dimensions of the well, was difficult to obtain. On December 23 the contractor wrote to the engineer submitting various proposals. These were considered by a sub-committee, whose decision was that the notice should be given for which the deed provided, dismissing the contractors and announcing that other arrangements would be made for completing the work at the plaintiffs' expense.

The contractors evidently were well advised by their lawyers, for they informed the Hastings Council that the notice was of no avail, and that such questions as were in issue were to be decided by two arbitrators. On January 1 the contractors selected their arbitrator, and asked the Council to name another within seven days. As the Council course was not followed the plaintiffs moved for an injunction.

The clauses relied on by the plaintiffs were, generally speaking, of an ordinary character. The plaintiffs undertook to execute the works to the satisfaction of the engineer, but it was added that if any dispute arose between the Council and the engineer or the contractors as to the mode of carrying out the work, or the interpretation of the contract, or otherwise in relation thereto, or the settlement of the account, the same was to be referred to the arbitration of two arbitrators, subject to the provisions of the Arbitration Act, 1889, and no action was to be brought in reference to the matter in dispute except for the purpose of enforcing the award. The engineer or officer of the Council had the power to dismiss forthwith any workman or workmen found to be incompetent. If work were executed with unsound materials or not in accordance with the specification it was to be reconstructed or restored if the engineer so directed, and the engineer was empowered to employ other workmen or use other materials if necessary. The engineer could also have unsound or unfitted materials removed. The expense incurred was to be deducted from the monies due to the contractor. It will thus be seen that the contract was as rigorous as could be desired. The Hastings Town Council were so much masters of the situation they must well have imagined, as counsel stated, that they could imitate other municipalities, and after taking the work out of the contractor's hands complete it by their own works at a cheaper rate. It had to be admitted that in the last which passed there was no specific complaint against the contractors. There was, of course, grumbling, but it was a contract carried on with nothing but congratulatory on the part of those who had charge of the works?

The only question, therefore, at issue was whether it was necessary to call in arbitrators. Counsel for the defendants contended that unless the engineer had the power to act, then the clause by which he could serve no

the work was improperly conducted or sufficient despatch as not used became futile. Counsel for plaintiffs could not dispute the power to give notice, but said it was one of those cases of dispute between the engineer and the contractor which were to be referred to arbitration.

Mr. Justice FARWELL, in giving judgment, said that if the engineer alone was to be the sole judge the Court could not interfere. But in clause 2 it was stated that disputes between the engineer and the contractor should be referred to arbitration. There was no other provision in the contract to override that clause. Suppose the engineer out of spite dismissed the foreman, were the contractors not to insist on arbitration? Without the arbitration clause the contractors would be delivered bound hand and foot to the engineer. His Lordship said he found more difficulty in determining whether the Court could interfere by injunction. By the defendants' view the Corporation could turn out the contractors if so advised by their engineer. His Lordship considered that it was implied at such a course would not be followed unless it was ordered by the arbitrators. His Lordship therefore granted an injunction until the arbitrators had decided whether the engineer was right or wrong.

It will be seen that the case is not yet ended. When it is necessary for a judge to suppose that something is implied, another judge under different circumstances may take an opposite view. There was no exaggeration in supposing that the contractors could be dismissed. By an exceedingly simple process they would in that case not only lose money, but they would run the risk of being considered unsuitable to undertake similar works, and consequently a grievous punishment would be inflicted on them. So many public bodies now meddle with construction, it was not unwarranted if plaintiffs' counsel to suggest that the defendants were in danger of becoming their own contractors. That is a consideration which should not be scouted by other contractors. The whole system of executing work has been changed in recent years, and it cannot be said that the change has been entirely advantageous to general contractors. Nevertheless, it is still supposed that the contractors' fate should depend on the will of one man. Whatever may be the final issue in the Hastings case, there is more satisfaction when an arbitrary act, although believed to be justified, is approved by two other experts who can make an investigation without having the least interest in the result except the triumph of equity.

HAMPTON COURT.*

FOR the majority of people the interest of Hampton Court is mainly derived from its history. The Manor is known to have been worth 40*l.* a year in the time of EDWARD THE CONFESSOR. In Domesday it is entered as only one-half that amount. Early in the thirteenth century it was bequeathed to the Knights Hospitallers, by whom WOLSEY was granted a lease. It is now impossible to say why he should be anxious to erect a palace in that situation. It was too distant from London for a statesman's continuance of whose office did not depend on the pleasures of an assembly, and if WOLSEY's dreams were of the privacy there could be no special advantages for the realisation of them in the tenure of such a place. But having obtained possession of the land he resolved to build in a new style.

Hampton Court being chiefly constructed of brick, there were architectural limitations imposed by the material which could not be easily surmounted. It is possible that WOLSEY adopted a homely design for the exterior on the intention of creating greater surprise to a visitor when he entered. In the account which CAVENTISH, WOLSEY's secretary, gives of the visit of MONTMORENCI, the French ambassador, there is very little said except about the impressions made on him by the gorgeousness of the interior. Emphasis was given to the cupboards finished with gold and silver plate, the Arras hangings, great candlesticks, the music and entertainments, so that the Frenchmen, as it seemed, "were rapt into a heavenly paradise." Gold and silver abounded in all the

rooms. This view is confirmed by the report of a conversation soon afterwards between FRANCIS I. and the English ambassador. The French king had heard so much about the interior, all his inquiries related to the exterior. According to the account, "He was very desirous to here, and to take great pleasure to commune with me thereon, shewing me He had said that Your Majesty did use much gilding in your said houses, and specially in the rowffes, and that He in his building used little or none, but made the rowffes of tymbre fyndly wrought with dyvers cullers of woode naturall." At this time the palace had been presented by WOLSEY to HENRY VIII., who was engaged in adapting it to his own requirements. A Frenchman would find it difficult to understand why there should be much difference between the interior and the exterior of a building as regards architectural quality. At Hampton Court the exterior corresponded with the English work of the time. But within, the building is a remarkable example of the change which was about to arise. In a general view the rooms will appear to correspond with English work, but when examined closely it becomes manifest that the spirit of the Renaissance had succeeded in gaining admission, and exhibited its power in many of the details.

If the buildings are to be judged by a palatial standard, it cannot be said that they will bear comparison with examples which are seen abroad. The work of the early part of the sixteenth century and that of the end of the seventeenth century were alike mainly derived from domestic buildings. In both cases residential purposes are recognised, but something more is needed for buildings which are to be the scene of grand functions and where State business is transacted. It was in that way Mr. FERGUSSON considered the older and the later work when he said:—

He (Wren) was more successful at Hampton Court, though here the basement is too low, especially in the courtyard, and the dignity of the "bel étage" is destroyed by the circular windows over the principal ones, and, where orders are introduced, they are merely as ornaments, and overpowered by the attic that crowns them. The great merit of this design is its largeness, and being devoid of all affectation. From the possession of the first quality it contrasts favourably with Wolsey's palace, to which it is attached. Neither is of the best age of its peculiar style, nor perhaps the best of its age; but there is a littleness and confusion about the Gothic as compared with the simplicity and grandeur of the Classic which is altogether in favour of the latter. When, however, the earlier design is looked into it displays an amount of thought and adaptation to its uses which is wholly wanting in the Classic. Wren's design looks as if it could have been made in a day; Wolsey's bears the impress of long and patient thought applied during the whole time it was in execution; and though, therefore, the conception of the first is grander, the ultimate impression derived from the latter is more satisfactory and more permanent.

The monarchs who succeeded HENRY VIII. were not disposed to spend money on Hampton Court. ELIZABETH, who was the most favourably placed to incur expenditure, preferred the Thames as seen at Greenwich. CHARLES I., who enjoyed the place and added many pictures to the collection, was for a time a prisoner in the palace. During the Protectorate there was an order made that the palace, with its outhouses and gardens, should be sold. But CROMWELL was able to obtain possession of Hampton Court, and he used it like his predecessors for an occasional residence. CHARLES II. was disposed to carry out many alterations. PEPYS in 1665 describes the king as "mightily pleased with his new buildings there." The sedate JOHN EVELYN, who visited it in 1662, speaks of it as a noble and uniform pile and as capacious as any Gothic architecture could have made it. But he is more enthusiastic about the interior, with its "incomparable furniture." In fact, most of the old accounts of the palace refer to what was to be seen in the chambers and galleries. One of the innovations introduced by CHARLES II. was the painting of the walls and ceilings, a practice which was more common on the Continent than in England.

The staircase at Hampton Court, which was one of the subsequent works, is so tremendous an example of mythological painting, there can be little doubt it has deterred public authorities as well as individuals from giving commissions for mural decoration. It was supposed to be a type of the grandest style, and it was enough to confound

* See Illustration.

the largest manner of architecture. VERRIO, the painter, was a Neapolitan who had settled in France. CHARLES II. brought him to England in the hope of VERRIO's becoming a rival of LE BRUN in the designing of tapestries which were to be produced at the Mortlake factory. Instead of work of that kind he was allowed to be busy at Windsor and Hampton Court, and was paid liberally. He was also appointed as master gardener. But his expenses exceeded his receipts. Out of loyalty to the STUARTS he refused to paint for WILLIAM III., and it was only when persuaded by Lord EXETER he condescended to undertake the great staircase at Hampton Court. There is evidence to suggest that the painter was then irregularly paid. His allowance was 10*l.* weekly for himself and his assistants. Instead of 260*l.*, the amount due for the period between December 1701 and June 1702, he complained that he had received only 50*l.*, leaving a balance of 210*l.* A month afterwards we find VERRIO again appealing for money. He stated it was arranged that he was to receive 400*l.* for painting the great bedchamber at Hampton Court. For the great staircase and little bedchamber his charge was 1,800*l.* All he had been given was 1,190*l.* His necessities were said to be very pressing, and without speedy assistance he was likely to be reduced to an extremity. We find WREN reporting on an appeal of VERRIO for money to pay for colours he needed to finish the great room at Hampton Court. He had been paid only 200*l.*, and 500*l.* was required to pay for his subsistence and charges until the room was complete. Up to 1688 VERRIO was in receipt of 200*l.* a year as chief painter. The office was held by JOHN RYLEY and GODFREY KNELLER during a part of the reign of WILLIAM and MARY.

VERRIO was not the only person engaged at Hampton Court to whom money was owing. WILLIAM ROBERTS, the plumber, who described "Mr. TALMAN" as his substitute, said he was employed to cast and make pipes for the gardens and fountains. After the death of WILLIAM III. the pipes had to be used to repair the main pipe which brought water from Coombe to the house, and he remained unpaid. In another appeal ROBERTS declared the amount owing to him for plumbing at Hampton Court, Kensington and Windsor was 3,971*l.* 5*s.* 2*d.* One ROBERT BALLE, a merchant of London, claimed 600*l.* for seven marble statues and one marble head ordered from him for Hampton Court a little before the death of WILLIAM III. The sum charged was what he had paid in Italy. Queen ANNE and her Ministers appear to have settled all the outstanding claims. VERRIO was also provided with a pension which was similar in amount to the sum he received when chief painter, or 200*l.* a year, but he did not live long to enjoy it, for he died at Hampton Court in 1707.

It will be observed that ROBERTS, the plumber, refers to WILLIAM TALMAN as his substitute. Although so described TALMAN seems to have been an architect, and a busy one towards the end of the seventeenth century. He was born, according to WALPOLE, "at West Lavington in Wiltshire, where he had an estate; was comptroller of the works in the reign of King WILLIAM; though of his life I find scarce any particulars, although he was an architect employed in considerable works." Among the buildings ascribed to him are Thoresby House in Nottinghamshire, Dyrham House in Gloucestershire, Swallowfield in Berkshire, and Chatsworth. It would seem as if his comptrollership at Hampton Court gave some annoyance to WREN, and his aim might be supposed to oust the more able architect from his position. As comptroller TALMAN was succeeded by VANBRUGH.

There were two reasons which may be said to have compelled WILLIAM III. to give more attention than CHARLES II. to Hampton Court. Bishop BURNET records that when the king came to St. James's, the absence of exercise and hunting made him so weak that ill effects were anticipated. He did not wish that the influence of London upon him should be apparent, and the restraint he put upon himself made him peevish, silent and reserved. After a few days he went to Hampton Court, and travelled to London only when meetings of the Council were held. The retirement caused general disgust, for the gaiety and diversions of the Court disappeared. The Bishop tells us that "the king found the air of Hampton Court agreed so well with him that he resolved to live the greatest part of the year

there. But that palace was so very old built and irregular, that a design was formed of raising new buildings there for the king and the queen's apartments. The king showed a resolution to live at a distance from London; and the entering so soon on so expensive a building afforded matter of censure to those who were disposed enough to entertain it, and this spread a universal discontent in the City of London." WILLIAM, however, was not the man to be daunted by popular clamour. Next to hunting he preferred architecture and gardening as amusements. He had erected a palace on a heath in Guelders which was reported to be a wonder of art, and he decided to create a second Loo on the banks of the Thames. A large extent of ground was laid out in gardens in the Dutch style. Trees were transplanted from neighbouring woods. WREN received the commission to make the alterations, and he provided apartments for the king facing the private garden and the Thames. Their length is 320 feet, while the queen's suite facing the Home Park is 2 feet longer. WILLIAM's taste was not very refined. ELMES says that WREN at Hampton Court was under Batavian influence and was never less happy in designing. The king was too just not to assume responsibility for the defects. According to Lord PEMBROKE, when the lowness and disproportion of the arrangement of the cloisters or arcade under his apartments were complained of, the king honestly excused his architects by acknowledging that they were so constructed by his express command.

In those days, when roads were rarely found in proper condition, a journey to Hampton Court could not be expeditiously performed. On the one hand Hampton Court was too remote to allow of consultation with the monarch, and on the other WILLIAM feared that if he lived in London death was not far off. As a compromise Kensington House, which belonged to the Earl of NOTTINGHAM, was purchased for 18,000 guineas, and then followed "more building, more planting, more expense, more discontent." But his preference was always shown for the more rural abode. When WILLIAM returned after his last visit to Holland he gave orders he was to be brought direct to Hampton Court. Three months afterwards he there received through the stumbling of his horse the contusion which his feeble frame could not resist.

WILLIAM III. had no successor as a builder at Hampton Court. The alterations since his time have been of little importance. Indeed, some which were perpetrated a few years ago can only be considered as injurious to the Palace. The first and second GEORGES lived at Hampton Court, but from the reign of GEORGE III. it can hardly be regarded as a royal residence. Some of the apartments are now used as dwelling-places by individuals who have done the State service or by their representatives. But the principal rooms or State apartments have become no more than a museum. The walls are hung with pictures which are not of uniform value. The cartoons of RAPHAEL are no longer to be found there. The tempera paintings by MANTEGNA of the *Triumph of Julius Caesar* continue to make the gallery the most occupied one of the attractions of Europe. The building has also their historical associations, and for many reasons they are now and will continue to be one of the places which are best worth a visit in England.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE third craft evening in connection with the above Society was held on Thursday, January 29, the president, Mr. Butler Wilson, F.R.I.B.A., in the chair. The demonstrator for the evening was Mr. Walter Gilbert, of the Bromsgrove Guild, who discoursed upon "Decorative Metal Work" and exhibited and explained the processes connected with various examples of the art produced by his band of fellow workers. Previous to this he delivered a short but interesting paper in which he traced the history of the ancient guilds from their inception, and dwelt upon the fact that in the days gone by everything manufactured seemed unavoidably touched by the finger of art. He contended that the misleading phrase "Gothic work" should give place to some such term as "guild work." The craftsman in former times made his work as amusing to himself as he could, and lavished treasures of human hope and thought on everything that man makes from a cathedral to a porridge pot.

THE LEGAL RIGHTS AND LIABILITIES OF ARCHITECTS AND SURVEYORS.*

TO anyone at all familiar with matters relating to architects and surveyors, the subject and proper scope of the present address will be indicated with sufficient clearness by the above title. It may nevertheless be not inappropriate at the outset to point out certain limitations to the generality of the title, and to define a little more clearly the questions proposed to be considered. In the first place, some limitation to the generality of the title is required, because there is a broad and obvious sense in which the rights and liabilities of architects and surveyors, or of any other class of professional or business men, are the same as those of any individual members of society, and a consideration of all such rights and liabilities would involve a survey of the entire law as to persons—a task plainly out of the question. It is clear that the purpose of the present address must be limited to the consideration of those rights and liabilities on the part of architects and surveyors which arise from the position in which members of those professions are usually found, in relation to their employers and to other persons who may also be employed in the same matter. It may then be suggested that the subject for consideration should be the rights and liabilities of architects and surveyors as such, but this limitation would be too severe, for notwithstanding the above title it may with safety be stated that neither architects nor surveyors have any rights or liabilities simply as such. They do not, like members of the legal or medical professions, require any legal qualification to practise, and nothing analogous to the Solicitors' Acts or the Solicitors' Remuneration Act applies to them. They are not subject to any legal restrictions or regulations as to their professional conduct or remuneration. They are not, in fact, protected or harassed, as the case may appear, by any special legislation or rule of law, and any person, however ill-qualified, may set up and practise as an architect or a surveyor, or as both, and if being so ill-qualified he can induce the public to employ him, so much the better for him and so much the worse for the public. It is true that as some protection and guarantee for the public, as well as in the interests of the respective professions and for the mutual benefit of their members, societies of architects and surveyors have been formed, and have framed rules as to professional etiquette and remuneration, but these rules only bind the members as a condition of membership. They have no binding legal effect whatever. In this respect the position of architects and surveyors is analogous to that of accountants or engineers, who are alike free from any legislative trammels as to qualification or professional conduct or remuneration.

What, then, are the rights and liabilities proper for our present consideration? for, as already indicated, it is obvious to all familiar with the subject that the position of architect or surveyor does frequently and, indeed, generally give rise to rights and liabilities which may with propriety be described as those of architects and surveyors. They will be found for the most part to depend upon the law of agency, and upon the position in which the architect or surveyor is so frequently placed as the agent of the employer or building owner in superintending works to be carried out for such employer or building owner under what is known as a building contract.

Attention may here be drawn to the fact that a very great part, if not the greater part, of all legal problems and complications in matters and between persons of every kind arise from this law and position of agency. In company matters, for instance, as a company though a "person" in law is incapable of acting except through agents, scarcely any dispute or point arises into which the question of agency does not enter. Disputes or litigation between two individuals or parties simply and not complicated by any question of agency on the part of either of them or of any other parties, are usually of a more or less simple character, apart from the question of torts or wrongs which need not be here considered. Such disputes or litigation are most frequently upon some simple question of contract, the point being whether there was any and what contract, whether there had been a breach of it, and what is the legal right or remedy in respect of such breach, and in such cases the question is usually one of evidence rather than law. So cases with simple questions between architects or surveyors and other persons directly and apart from questions of agency. If I employ an architect to prepare me a plan or a surveyor to measure up a piece of land or get out some other quantities, and he performs the work with the skill reasonably to be expected from a person holding himself out to be qualified for such work, he is entitled to be paid the stipulated or reasonable remuneration, and upon his being so paid the transaction is at an end. Such a simple transaction is in all respects similar to a bargain made, for example, with a portrait-painter to paint a portrait.

I may not like or use the plan prepared for me; I may not like the portrait, and may prefer to hang it in the back bedroom or with its face to the wall, but if it has been done with such reasonable skill as aforesaid I am bound to pay for it, and there is an end of the matter. If the usual transactions with architects or surveyors were of this simple nature there would hardly be more occasion to consider the rights and liabilities incident to the practice of these professions than there would be to consider those of portrait-painters, photographers or the like, and the present paper might almost end here as a sufficient survey of such rights and liabilities. Such, however, is very far from being the case. The terms of their employment usually involve not only the designing or suggestion of works, but their supervision of the works designed or suggested whilst in progress, for the purpose of seeing that they are duly executed in accordance with the plans and specifications. This brings them into relation with other parties, and it is this relationship which gives rise to so many of the rights and liabilities proposed to be considered.

It appears from the foregoing introduction that the particular rights and liabilities so to be considered usually arise under what are known as building contracts, or contracts of the like nature, and that the chief of them are incident to the position of the architect or surveyor as the agent of the employer. Those familiar with such contracts are aware that in addition to his position as agent, the architect or surveyor is for the prevention of disputes invested with certain judicial or arbitral functions which give rise to other rights and liabilities to be considered in their due place. Having thus outlined the scope of the address and the subjects for consideration, I now propose to deal with those subjects in detail, and under the following heads, that is to say:—

1. The proper qualifications of the architect or surveyor.
2. The position of the architect or surveyor under simple contracts of employment not involving or apart from questions of agency.
3. The position of the architect or surveyor as agent of the employer under building contracts or the like; and
4. The position of the architect or surveyor in his quasi-judicial capacity or as arbitrator under building contracts or the like.

Proper Qualifications.

I have used the term proper qualifications advisedly, for it has already been seen that no qualification is legally necessary. Architects and surveyors, however, are in the position of persons holding themselves out as competent to perform certain work requiring certain skill, and they impliedly guarantee that they have such skill. If therefore they do the work so badly or carelessly as to indicate lack of the required skill they will be unable to recover remuneration for it and might be made liable for damages should loss or injury result from negligent or unskilful work. I believe that in France an architect has been held criminally liable for the death of a man killed by the fall of a building owing to its defective design, and though I am not aware of any such case in England, circumstances could be conceived in which under the English criminal law a negligent architect could be so made liable. As regards the matters in which skill or knowledge is required to make a competent architect or surveyor, they may be generally stated as follows, that is to say:—

- (a) Skill in the preparation of plans, drawings or designs suitable for the particular work to be executed, or in the case of surveyors, skill in the measurement or surveying of land or in suggesting plans or ideas for the development thereof.
- (b) Knowledge of the materials to be used and of the proper application or use of such materials.
- (c) Knowledge of Building Acts and the requirements of local authorities and of the law as to light and air, support or other easements.

If through ignorance or neglect of any of these matters on the part of the architect or surveyor the work designed or suggested should prove to be impracticable or fail, that would be evidence of such want of proper skill on the part of the architect or surveyor as to disentitle him to remuneration. But although persons undertaking to do work requiring certain skill impliedly guarantee that they have such skill, yet if an employer deliberately employs for the carrying out of important works requiring high and special skill a person whom he knows has not enjoyed a practice likely to give him the requisite experience and knowledge, he would not in the absence of special guarantee or representations of sufficient knowledge and experience be entitled to recover damages from the architect or surveyor in the event of the work proving unsatisfactory. See Macassey and Strahan on Civil Engineers, pp. 36 and 37, and the case of Henry and Belfast Board of Guardians, cited on p. 39.

As regards requirements (a) and (b) little more need be said. What is expected of architects and surveyors in these respects is pretty generally understood. Of course the amount of skill and knowledge required in each case depend upon the nature and importance of the particular work to be done.

* A paper, by Mr. H. H. Richardson, solicitor, Clement's Inn prizeman, 1879, Hon. M.S.A., read before the Society of Architects on Thursday, January 22.

As regards (c), it is obvious that a lack of acquaintance with statutory or local requirements, or with the rights of adjoining or neighbouring owners may render a plan or suggested works, however otherwise excellent, impracticable and useless, and it is therefore of the utmost importance that architects and surveyors should be thoroughly familiar with such requirements and rights. All men are presumed to know the law—ignorance of it excuses no one—and architects and surveyors no less than lawyers must carry on their practice under the burden of this stupendous presumption.

In this connection it may be pointed out how important it is to architects and surveyors, in their own interests, to know what contracts, in order to be binding, require to be in writing under the Statute of Frauds and what require to be under seal. Under the Statute of Frauds contracts relating to land, and also contracts the performance of which must necessarily extend beyond a year, require to be in writing, signed by the party to be charged, and contracts with corporations require generally to be under seal; and architects and surveyors, in dealing with corporations, should therefore be on their guard against relying on memoranda or writings merely signed by an officer of the corporation.

Position of Architect under Contract.

We may now pass on to the consideration of the position of the architect or surveyor under simple contracts not involving or apart from questions of agency.

In such cases the position in which the architect or surveyor stands towards his employer is that of a skilled servant, and in it he will be expected to possess and properly display such skill and knowledge as has been already indicated, and moreover to perform the duties he undertakes with such care, attention and fidelity as to free him from any charge of negligence. The simplest cases of such position and employment are those where the architect or surveyor is employed to prepare plans or designs, or make suggestions for works without reference to the question by whom such works are to be carried out, or superintended or whether they are to be carried out at all. The simple bargain in such cases is—stipulated work to be done with proper skill on the one part, and the stipulated or a reasonable payment therefor on the other.

One or two points, applicable alike to such simple contracts of employment and to contracts involving agency, may be rapidly noticed. As already stated, the contract may be for a period of employment greater than a year and so may require to be in writing, under the Statute of Frauds, signed by the party to be charged. It may be with a corporation and so require, generally, to be under seal. The plans, designs or suggestions may be ordered for the approval of the employer, and, if this is clear, nothing is payable for them unless they are approved or at any rate used. See *Moffat v. Dickson*, 22 L J C.P. 268.

They may be sent in in response to an invitation to compete, in which case, unless remuneration is offered by the terms of the invitation to unsuccessful competitors, they will not be entitled to any unless their plans or designs are actually made use of. Under this head the question of ownership of plans and designs may be considered. Does the employer, when employing an architect or surveyor in the usual way, purchase the plans, drawings or designs, or only the use of them for the purposes of the designed works? It was formerly considered that by the custom of the profession the latter was the case, and that the drawings remained the property of the architect notwithstanding payment. The contrary, however, appears to be now settled by the case of *Ebdy v. McGowan*—*Times* of July 7, 1870—and whatever may be said with respect to the ownership of plans prepared for the purposes of works to be carried out under the superintendence of the architect, it is impossible to doubt that where an architect is simply employed to prepare a plan or design without more and without definite agreement to the contrary, the plan or design would, upon payment therefor, be as much the property of the employer as a portrait ordered to be painted for him and duly paid for. If the effect of the bargain is to give the property or the plans to the employer, it is clear that he can use them for any purpose he pleases, and need not confine their use to the purpose for which they were originally prepared or intended.

The contract between the employer and an architect or surveyor is a personal one, and the employer is entitled to have the work done or superintended by the architect or surveyor personally. Consequently the death of the architect or surveyor terminates the contract, though that of the employer does not necessarily do so, and his executors may under the contract be entitled to have it carried out for the benefit of the employer's estate. Should the architect or surveyor die before the completion of the work, and before any payment has become due for it, he would not in the absence of agreement to the contrary be able to recover any payment, but if his services had been retained at a salary he could recover so much of the

salary as had become due at the date of the death. See *Stubbs v. The Holyhead Railway Company* L.R. 2 Ex. 311.

Apart from the strict practice of their respective professions, architects and surveyors may, like other professional persons, be employed to give evidence before Parliamentary committees or the like in support or in opposition to some particular measure, or to give expert evidence in a court of law. In such cases they are of course entitled to be paid proper fees, having regard to their standing and reputation. They are also in practice frequently employed as valuers, and although, as before stated, they are not in their ordinary professional capacity hedged about by legislation, yet if they act as valuers or appraisers it appears that they should take out qualifying licenses therefor under 46 Geo. III., c. 42, ss. 4 and 7; or 8 and 9 Vict., c. 76, sec. 1.

As regards protection from libel or slander, architects and surveyors have, of course, the like legal rights and remedies as other people. It would be libellous to write and slanderous to say of an architect or surveyor that he was incompetent, or that he had not sufficient skill, knowledge or experience for the carrying out of any work undertaken by him. See *Botterell v. Whitehead*, 42 L.T., N.S. 588.

Liabilities as Agents.

With this summary survey of the rights of architects and surveyors as skilled servants, we may now proceed to consider the more important and, from a legal point of view, more interesting question of their rights and liabilities as agents or otherwise under building contracts or the like. These come under heads 3 and 4 above mentioned. First then we deal with head 3, that is to say, the position and authority of the architect or surveyor as agent of the employer. In the simple cases dealt with under head 2 the architect and the employer are the only persons concerned. When the architect is employed not only to design the building but to superintend its construction he is brought into relationship with those who are employed to construct it, and it is this relationship and the duties and liabilities arising in connection with it which are now to be considered. The same lack of personal skill or knowledge which usually precludes a building owner from designing the work he wishes to have done precludes him also from seeing that it is done properly by the person employed to do it. He has, therefore, to employ someone to perform this service also for him, and in building contracts this person is usually and properly the architect or surveyor who has designed it. The owner having satisfied himself that a building or work erected or done in accordance with the prepared plans or designs will be what he wants, employs a builder or contractor so to erect or do it, and an architect or surveyor to see that it is so erected or done. He thus constitutes the architect or surveyor his agent for the purpose of seeing the desired work carried out. Now agency is of two kinds. A man may appoint another to be his agent simply for some particular purpose or purposes—as in the case of an agent or attorney appointed to execute some particular deed or deeds, or to give receipts in some particular matters. In such cases the person to whom the deed is to be executed or the receipts given must see that the agent has that particular power, otherwise he may find that the principal is not bound. He cannot rely upon the mere word of the agent that he has the professed power. On the other hand, he may appoint someone to be his general agent to do all such things as may be necessary or proper for some purpose or undertaking. In such cases the authority given is an authority to act in a certain capacity for all the purposes of the undertaking in question. A person put forward to act as such general agent can bind his principal by all acts within the scope of his employment, although the principal may have privately limited his authority in particular matters. The position of the architect or surveyor under a building contract is one of general agency, and his position as such general agent appears from the leading case of *Kimberley v. Dick*, L.R. 13, Eq. 1, where the question of the character in which the architect stood was considered under the terms of a building contract. "I am of opinion that I must treat Mr White (the architect) as the agent of Mr. Dick (the building owner) generally, for all purposes connected with this building, and that without any limitation as to price or anything else." The decision of the case upon the point is thus summarised by Mr. Roscoe in his useful digest of building cases:—"The architect is the agent of the employer generally for all purposes connected with the erection of the structure of which he has prepared plans, and the erection of which he is to superintend."

The general principle is thus laid down and established. The bearings of it lie, like Captain Bunsby's observations, "in the application of it," that is to say, when any question arises as to the employer's liability for the acts or orders of the architect or surveyor, such question will usually be found to depend upon whether such act or order was, in fact, within the scope of the general authority given.

If an agent falsely represents that he has an authority

which he has not, and thereby induces another person to act on the faith of his representation, that is a fraud for which if the person so induced to act is thereby injured he could recover damages. See *Randell v. Trimen*, 18 C.B. 786. Of course as between himself and his employer simply the position of the architect or surveyor under a building contract is still that of a skilled servant, and the same skill, knowledge and care requisite in the preparation of the design must continue to be shown in the superintendence of the work, and for any neglect of his duty in this respect the architect or surveyor might be made liable. Questions as to the extent of the architect's or surveyor's authority under a building contract must frequently arise in respect of the following matters, viz:—(a) Alterations and deviations from plans; (b) extra work; (c) authority to employ quantity surveyors, and (d) certificates.

In properly-drawn building contracts all these matters are carefully provided for, and in so far as they are so the rights and liabilities of the parties will be determined by reference to the particular provisions. In the absence of special provision the authority of the architect as the general agent of the employer does not extend so as to entitle him to permit any alterations or a deviation from the accepted plans, or to order any extra work to be done. If, therefore, he permits or orders any such alterations or extra work he will not thereby bind the employer, and may render himself personally liable to the contractor. Of course, in all these cases the unauthorised order may be accepted and ratified by the employer, but architects and surveyors will be well advised to avoid any risk by keeping well within the bounds of their general authority, as limited or extended by the contract, and in the event of anything appearing desirable to be done, but of doubtful authority, to obtain clear written directions and authority for the execution of any alterations or extra work.

It is usually provided that no extra work should be done without a written order of the architect, and in such a case a written order is a condition precedent to payment for such work, and its mere inclusion in an interim certificate will not prevent the employer from objecting to payment on final adjustment. See *Tharsis Sulphur, &c., Company v. McElroy*, 3 App. Cas., 1040.

In the course of a comparatively short paper like the present, these and similar questions of detail can only be briefly touched upon. It is sufficient to keep in view the position of the architect or surveyor as agents and the main principles of the law of agency, viz. that the agent must not exceed the limits of his authority, otherwise the principal will not be bound, and that persons dealing with the agent must be satisfied that he has the authority he claims, either under the instrument of his appointment or as coming within the scope of authority as general agent for the purpose in hand.

As regards (c), it does not appear to have been anywhere laid down that power to employ a quantity surveyor comes within the scope of the architect's authority simply as agent of the employer under a building contract, and his right to do so if it exists appears to depend upon custom. See *Moon v. Witney Union Guardians*, 3 Bing. N.C. 814.

(d) *Certificates*.—The position of the architect or surveyor with respect to the giving or withholding of certificates is of the highest importance, and may be regarded from the point of view of the architect or surveyor—(1) as skilled servant; (2) as agent of the employer; and (3) as arbitrator. As skilled servant he must have and use the skill necessary to show that the work certified for has been properly done, and failure in this respect will amount to negligence for which he will be liable to his employer.

(2) As agent of the employer he must act in his interest without collusion or any other surreptitious dealing.

(3) As arbitrator he must honestly and impartially exercise the quasi-judicial functions entrusted to him.

In granting or withholding certificates the architect's conduct (apart from collusion or fraud) cannot be impugned, and his decision is final. But wilfully to certify work to be done when it is not done is a fraud upon the employer, for which he would be liable, and collusively to withhold a certificate properly due would be a fraud upon the contractor. But mere negligence or want of skill in granting or withholding a certificate is not sufficient ground for impeaching the certificate, though as regards the employer whose skilled servant he is, negligence in granting a certificate for work not properly done would render the architect or surveyor liable.

The almost autocratic power put into the hands of the architect under the usual terms of a building contract has often been alleged as a ground of complaint on the part of the builder or contractor. Whether such complaint be just or what alterations likely to be accepted are proposed, would be fitting and interesting subjects for discussion in a paper on the rights and liabilities of builders and contractors; suffice it to say here that owing to competition the employer is generally in a position to dictate his terms, and that from the point of view of the architect or surveyor he very naturally claims, not only as agent of the employer, but in the interests of his own

reputation, to be put into a position which will enable him to see that the works designed by his skill are not jeopardised by any want of skill or care or honesty on the part of those employed to carry them out. Even-handed justice to the contractor must be what no doubt in the vast majority of cases is found—the fairness, integrity and high-mindedness of those into whose hands these powers are put.

This brings us to the last of our four heads, namely, (4) the position of the architect in his judicial capacity or as arbitrator. This, as has been seen, arises to some extent in connection with the question of certificates, but what is here more specially referred to is the position of the architect or surveyor as dispute preventer. If it is clear from the contract that the parties have agreed that he shall so act they must be taken to have conferred upon him a judicial capacity.

His decision is final unless some appeal is provided, and cannot be impeached for want of proper care or skill or upon any ground but that of fraud. There is no more familiar legal dictum than that fraud vitiates everything, and so it will vitiate the decision of the most fully-empowered judge or arbitrator. Nor must he do or be party to anything which would interfere with the proper impartiality of his position. Upon this point there is an interesting decision—that of *Kemp v. Rose*, 1 Giff. 258—where an architect having undertaken to his employer that the cost of the proposed work should not exceed a certain sum, it was held that he did not possess a sufficiently unbiassed mind to make his decision against the contractor just and conclusive.

The above survey, though necessarily very incomplete and imperfect, having regard to the many points in the position of the architect or surveyor under building contracts, will, it is hoped, suffice to show the general principles upon which questions relating to such positions must be decided, that is to say, the principles applicable to the relationship of (a) employer and skilled servant; (b) principal and agent and scope of agent's authority; and (c) arbitrator and disputants. Many interesting subsidiary questions remain to be considered—such, for instance, as the position and right of appointment of clerks of the works, the particular duties of quantity surveyors, the position of architects or surveyors with respect to questions of light and air, or the like. These, however, do not give rise to any different rights or liabilities, and are sufficient in themselves for independent papers. Nor has any attempt been made to deal largely with authorities, for a discussion of these to be of any use would leave insufficient time for the setting forth of those general principles upon which all such authorities are based, and which it has been considered (apparently not without reason) would afford sufficient material for the purposes of a single address before this Society.

THE NATIONAL GALLERY.

THE following additions have recently been made to the National Gallery, by bequest and gift:—

By the bequest of Mr. Charles Gassiot, two pictures by John Phillip, R.A., "Gossips at a Well" and "The Prison Window," and a picture by William Collins, R.A., called "Sunday Morning." These are hung in the Tate Gallery. Also a view of "The Severn off Portishead," by Patrick Nasmyth, hung in Room XX. in the Gallery at Trafalgar Square.

By the bequest of Lord Cheylesmore, "An Italian Landscape," by Jan Both, hung in Room X. in Trafalgar Square; "Cromer Sands," by William Collins, R.A., hung in the Tate Gallery; and "The Execution of Lady Jane Grey," by Paul Delaroche, temporarily placed with other pictures of foreign modern schools in the Tate Gallery.

By the bequest of Sir James Carmichael, two small works by Jan van der Heyden, "A Royal Château in Holland" and "A Dutch Church and Market Place," hung in Room XII. in Trafalgar Square.

By the bequest of Mr. George Vacher, a large water-colour of "Rezzonico and the Splügen Range, Lake of Como," placed in the water-colour room at the Tate Gallery.

By the bequest of Colonel John Morland, a small full-length portrait of Mr. Morland of Capplethwaite, an early work by George Romney. It is hung in Room XVII. in Trafalgar Square.

Mr. G. F. Watts, R.A., has completed the gift of his series of ethical and allegorical pictures to the National Gallery of British Art by the addition of his large picture of "The Court of Death," which is now hung in the room devoted to his works.

Another large and important work by Mr. Watts, which was painted for the Cosmopolitan Club and has hung for many years in its principal room, representing the story of the banquet of Anastasio degli Onesti from Boccaccio, has been presented by the members of the Club to the National Gallery of British Art. It is at present in process of being relined, and will be hung ultimately in the large sculpture gallery, opposite the "Isaiah" of Alfred Stevens.

NOTES AND COMMENTS.

AN ingenious attempt is to be made at Liverpool for solving the housing problem in a novel way. According to a description given by Mr. J. B. COLTON, a member of the Town Council, the buildings will be constructed of concrete made from refuse destructor clinker, and the sides, floors and roofs are all made in single individual pieces; they are stamped out in one block, and will be hoisted up and bolted together. The mouldings, fire-places, &c., are also formed in one mould, and stamped out under one pressure. The houses will be three storeys high, and will cost just half what it would to erect them in brick. The Council anticipate that the goal for which they are striving, namely, rents of 1s. per week per room, will be achieved, and they will be able to not only pay off their sinking fund but to make a handsome profit. One house per day could be erected. This is no parable or fairy tale, but an absolute fact. The Liverpool Council have to deal with demolitions on an immense scale. Although much has been done, about 10,000 slum houses remain to be removed. The rule has been made that demolition is to be regulated by the accommodation provided by the Corporation. In the new buildings no tenant will be accepted unless he has been dispossessed, and the rooms will remain empty until slum tenants seek the accommodation. In some of the houses already constructed one-roomed houses are let at 2s. per week, two-roomed 3s. a week, three-roomed at 4s. a week, and the four-roomed house at 5s. a week. For the purposes of a recreation ground 1,900 square yards were set off, and there were seven shops provided for. The land cost 14,466*l.*, and it was estimated that the buildings would cost 76,912*l.*, a total of 90,378*l.*, and upon this they estimated a return of 3 per cent. The rents are below the average charged in Liverpool. The plans are by Mr. TURTON.

THE Chapelle Expiatoire is not known to all English visitors to Paris. It is novel in form, and without much elevation. But it is at once recognised as a true "monumental" building. It was designed by FONTAINE (PERCIER & FONTAINE), who when a youth distinguished himself in 1785 by his design for a sepulchral chapel. After the resignation of PERCIER, FONTAINE became the royal architect, and he held the appointment under LOUIS XVIII., CHARLES X. and LOUIS PHILIPPE. The Chapelle Expiatoire was erected by LOUIS XVIII. as a memorial of LOUIS XVI. and MARIE ANTOINETTE, whose remains were interred in that spot of ground which had been the cemetery of the Madeleine. The title given to the chapel has often offended Republican susceptibilities, and, regardless of the merit of the building as an unique work of architecture, from time to time demands were raised for its removal. Twenty years ago, when an attempt of the kind was made, CHARLES GARNIER wrote that the chapel was a true *chef d'œuvre*, and that its demolition would be an act of real vandalism. Characteristically he asked why there should be so much hate against LOUIS XVI.; for if that king had not reigned it would have been impossible to overthrow the Bastille. A proposition is now before the French Parliament seeking authority for the destruction of the building, which, it is claimed, would afford a site for the new mairie of the district. The chapel may be demolished, but the historical fact that the king and queen of France were executed cannot in that way be obliterated.

READERS of CARLYLE'S "French Revolution" will remember the exciting scene of the arrest of LOUIS XVI. at Varennes. The postmaster DROUET, who was an ex-dragoon, was suspicious of a berline that entered the village of Ste Menehould, and with another old soldier followed the vehicle. When they reached Varennes the pair appealed to patriots, the bridge was barricaded, and when the vehicle arrived there was a demand for passports. Sieur SAUSSE, procureur and grocer, is present, and King and Queen are asked to remain with him until morning. The historian says:—"Procureur SAUSSE gives his grocer-arms to the Queen and Sister ELIZABETH, Majesty taking the two children by the hand; and thus they walk coolly back over the market-place to Procureur SAUSSE's, mount into his small upper storey, where straightway His Majesty 'demands refreshment.' Demands refreshments,

as is written; gets bread and cheese, with a bottle of Burgundy, and remarks that it is the best Burgundy he ever drank." SAUSSE's house is now known as No. 28 Rue de la Bas-Cour. It consisted in 1791 of two rooms on the ground floor and two on the first floor. The interior arrangement is unaltered. Recently the grocer's house was acquired by the Curé of Varennes, who wished to transform it into an expiatory chapel. The Government, however, would not permit of the change. The Curé had since died, and his representatives have decided to sell the little historic mansion where "imperial MARIE-ANTOINETTE was near kneeling to Son SAUSSE and Wife SAUSSE, amid candle-boxes and treacle-boxes," and from which the hapless LOUIS and his Queen departed prisoners for Paris, and eventually the Place de la Révolution.

SKETCHES AT HAMPTON COURT.

CATHEDRAL SERIES: WORCESTER.—EAST END OF PRINCE ARTHUR'S CHANTRY. DETAILS OF PRINCE ARTHUR'S CHANTRY.

THERE was no English ruler stronger in kingcraft than HENRY VII. One proof of it was seen in his dispensing with Parliaments, for during thirteen years only once was summoned. He took care so unusual an independence should not give offence by keeping the expenses of his court within the limits originally fixed. His first son was named ARTHUR, in memory of the ancient British race of which the king considered himself to be the representative. ARTHUR was born at Winchester in 1488, and in 1492, *i.e.* when he had hardly reached his fourth year, a treaty was entered into by his father with the king of Castile and Aragon for a marriage between the young prince and CATHARINE, fourth daughter of the monarch. Another treaty was concluded in 1496, when FERDINAND promised to give to the princess a portion of 200,000 crowns, and HENRY engaged that his son should endow her with one-third of his income at present, and one-third of the income of the crown, if he should live to wear it. The marriage was postponed on account of the youth of the bridegroom. When he had completed his twelfth year a dispensation was obtained, and he was married by proxy at Bewdley. Two years later the princess was demanded. She came to England and was married in Old St. Paul's. At the door of the cathedral before the people ARTHUR endowed her with one-third of his property. The festivities which followed were on so magnificent a scale as to bring ruin on many of the nobles. Lord BACON, writing on the subject, said:—"In all the devices and conceits of the triumphs of this marriage there was a great deal of astronomy, the lady being resembled to HESPERUS and the prince to ARCTURUS, and the old king ALPHONSUS (that was the greatest astronomer of kings and was ancestor to the lady) was brought in to be the fortune-teller of the match. And whosoever had those toys in compiling, they were not altogether pedantical. But you may be sure that King ARTHUR, the Briton, and the descent of the Lady CATHARINE from the house of Lancaster was in no wise forgotten. But (as it should seem) it is not good to fetch fortunes from the stars. For this young prince (that drew upon him at that time not only the hopes and affections of his country, but the eyes and expectation of foreigners), after a few months, in the beginning of April 1502, deceased at Ludlow Castle, where he was sent to keep his residence and court, as Prince of WALES. Of this prince, in respect he died so young and by reason of his father's manner of education, that did cast no great lustre upon his children, there is little particular memory. Only thus much remaineth, that he was very studious and learned beyond his years, and that beyond the custom of great princes." Two years after the death of the prince the chantry chapel was erected. It will be observed that in style it is characteristic of the Tudor period; the Tudor badges are frequent as ornamentation. The tomb of the prince, within the enclosure, is plain in style. There is an inscription around it, which no doubt was painted when the memorial brass was removed.

WESLEYAN HALL, EDINBURGH: LARGE HALL.

COUNTRY RESIDENCE RECENTLY ERECTED.

DESIGN FOR FONT AND DECORATION.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, A.R.A., president, in the chair.

Royal Gold Medallist.

The PRESIDENT announced that the Council had decided to submit the name of Mr. C. F. McKim, of New York, to His Majesty the King as a fit recipient for the Gold Medal.

Wellington Monument.

The PRESIDENT said the proposed completion of this monument had aroused general interest, but there were few people who were more interested than architects. The work had a quality which was specially appreciated by architects. The Council of the Institute had had the matter under consideration, and that afternoon he was requested to express the hope at the meeting that if the equestrian model of the Duke was in such a condition that it could be placed on the monument for examination and consideration before anything further was done that that course would be adopted, so that, if possible, to insure that the work might be completed as far as possible without the intervention of any other hand than that of Alfred Stevens.

The PRESIDENT then read the following

Address to Students.

Brother Students,—Ever since I undertook the responsibilities of this chair it has been present to my mind that it would be my duty and privilege to address you this evening, and I have wondered if there was anything that I could say that would be of use or help to you.

The experience of one man, valuable to himself, is seldom of value to another, especially if the other be a younger one, and in art, perhaps, this is more true than in any other career; each must work out his own salvation, and a stranger cannot intermeddle with his joy.

I am not speaking to-night especially to those who have just entered for the various prizes and studentships yearly offered by this Institute. This has been kindly undertaken by Mr. Walter Millard, who is especially qualified for the task and sure to fulfil it conscientiously and generously. I am speaking to students generally, students of what I think we might consider the greatest and noblest of the arts, the art of architecture, the most abiding and the most useful of the arts. Those of us who heard Dr. Evans's recent paper on his exploration of the Palace of Knossos in Crete must have felt as he laid bare before us the work executed by men some 3,000 or 5,000 years ago.

In addressing you students I shall endeavour to give you in the briefest and most condensed manner possible the main lines on which, as it appears to me, a student of architecture should endeavour to prepare himself for his work.

One thing I would first ask you on the threshold of your career, Are you quite sure you have chosen aright? No one can tell this so well as yourself, and you will probably, by this time, have had sufficient experience of what this career means to form a sound opinion, and I advise you deliberately, if you have any doubt, to throw it up now; you will be none the worse, but all the better for the training you have had, and you will find it useful in other careers. If, on the other hand, you determine to go on, decide at the same time never to look back again. It is a career beset of course with difficulties, and one that requires a lifelong training to enable you even to keep your place in it. Remember, this training must be irksome to you who have not their heart in the work, and it will shut you out of many pleasures you will see others enjoy; it is so encompassing that you will inevitably find yourself becoming, to some extent at least, a one-sided man, a contingency which certainly should not by anyone be lightly assumed.

But, on the other hand, if your heart is in it you will find an ever-varying character of your work a never-ending delight, trying you to many places and bringing you into contact with all sorts and conditions of men, a delight which cannot be equalled, and indeed can hardly be equalled, I think, in any other calling.

But to arrive at this you must follow it with patience. The young men seem to expect to attain success as soon as, or even before, they are out of their articles; the majority are necessarily doomed to disappointment. Work, you will find, is necessary, and that work must be lifelong; there is no rest or happiness without it. When a young genius was brought to Ruskin, his first question always was, "Does he know?" A clever man, he says, may be indolent, but a great man never. It is probably the ten years succeeding pupilage that are the most important in the life of most architects, and these must be the all-important ones in yours. How will you use them? Then you will begin to rely upon yourself and teach yourself, and cease to rely upon others, a very important principle. Mr. John Morley said a little time ago, in a speech, "What a splendid thing a man might make of his own life." He did not add, because I suppose it is so evident,

"What a poor, miserable thing he often does make of it." It is for you to decide to make a splendid thing of yours. Start with high ideals, for they will be sorely tried. A famous painter told a gathering of students a short time ago that he never painted a picture that realised the ideals he had started with; and if this is true of a distinguished painter, how much more true of lesser men?

Many years ago I read a paper on "Pupilage" before the Architectural Association, and after the paper a gentleman got up and was kind enough to say I had given them many useful hints as to how to do their work, would I now give them a few tips as to how to get it; but that was not part of my subject then, nor is it now. I will only say this, that if you take care to prepare yourselves and do the work that lies nearest to you as well and as thoroughly as you can, the work will come to you and you will not even have to trouble how to get it; the way you do what does come to you is the all-important thing. Remember Carlyle's description of common journey work well done for want of better. I shall take it that most of you here to-night have completed or are nearing the completion of your articles, and are about to commence your professional life in one capacity or another. You have been therefore through a course of systematic instruction, most necessary and most useful if a little dull, and you are now about to take a higher flight, urged, let us believe, by an ideal impulse. Do not clip your wings; the head has been educated, now it is the turn of the heart.

We will assume you have got knowledge. But with all your getting you must get understanding, get to the bottom of things and understand them. A well-stored memory is not the chief essential for an artist, though it is of great value to him. Cultivate curiosity and observation, and leave nothing unexplained. Now is your time. Some grow old without gaining any experience, through never having learnt to observe. Learn now how to learn, or you will never do it, and lead the "strenuous life." Don't be afraid of overwork; the number of people who overwork themselves is infinitesimal; the chances that you will be one of them are hardly worth taking into account.

I would recommend you, for one thing, to know as many artists of about your own age as possible, architects, painters and sculptors; meet together as often as you can, talk what is called "shop" with them, visit buildings, paintings and sculpture, old and new, together, criticise these things together, admire where you can and give your reasons, and when you must condemn, give your reasons also; get all you can from your friends, and give them all you can in return. The Royal Academy schools, this Institute, the Architectural Association and your own office will give you ample means of doing this, and you will make friends that will last your lifetime, and as difficulties arise in your work you will go to them for advice and counsel, and as occasion arises they will come to you for the same.

You will read, of course, "a lot." A very successful artist friend of mine (not an architect) once told me he had always made a rule of reading not less than five hours a day, and he was a very busy man. Few of you can do that, perhaps; but start with a high ideal and map out a certain time every day for the purpose.

You will have already read your text-books, your Fergusson, your Middleton, your Viollet-le-Duc and so on, and now you will read more of the romance of architecture, the story of the building of St. Sophia, of the Duomo at Florence, of St. Peter's at Rome and St. Paul's in London; the lives of great architects, painters and sculptors of all generations and countries; how they looked at their art and the principles that guided them in the execution of their work; you will read your Ruskin and in fact all the literature in connection with your art that you can lay your hands on (and there is no difficulty in that respect nowadays), for remember that your clients will expect you to know a great deal more about art in general and your own in particular than they do, and you must not let it be said of you, as a late Bishop of London said of a certain architect, "that he had sat next to him at dinner and was astonished to find that he (the Bishop) knew more about the Parthenon than the architect did himself."

Then, of course, you will sketch existing buildings, new as well as old, and try to get at the principles of their design and construction. In my day we used to sketch and measure an arcade, a doorway, a font, or other detail easily accessible, draw it out prettily and publish it in the "Architectural Association Sketch-Book," and, I am afraid, remain oblivious of the points in the plan, elevation and section of the building which produced the result we admired but did not understand. You will, I do not doubt, make a rough note of the plan, elevation and section of the building you are studying, and put on the leading dimensions, noting the thickness of the walls, the amount of lighting area, &c., and any distinguishing features this analysis brings out. Thus you will learn the real vertebra of the building, although you will probably have no notes fit for publication; but you will know

your building in its three dimensions; and you will be surprised, if you continue this plan, how it will give you a grasp of the general conception of buildings, which is what an architect should endeavour to arrive at. The detail is important—vitally important—but the conception is the principal thing; and as you come to design buildings yourself you will think of them in the same way as cubes, not as planes, and, having learnt what feet look like in existing buildings, you will at once understand what they will look like in your own buildings when they come to be realised from paper structures to real brick and stone. The great buildings of the world are admired because their dimensions are noble and proportionate the one to the other. You will, therefore, never rest till you have obtained this rhythmical music of dimension.

Then you will not think construction beneath your notice. It is at the root of all great architecture. Wren was a great constructor, the founder of the Royal Society, an inventor of scientific instruments and a scientific man. Go into St. Paul's and stand under the dome and think; go up into the spire of Salisbury Cathedral and think a little, and realise how greatly daring were the men who designed and erected these structures so that they have withstood the thrusts, the storms and natural decay of centuries, and remain the admiration of mankind.

Then you will also study materials—those that look well in work from colour and texture, and that weather well and improve by time. It is impossible, again, to exaggerate the importance of this towards a satisfactory building. You will also (if you are wise) keep a commonplace book and jot down dimensions of things as they come under your notice, because it will save you much time and trouble later, when your hands are full and your time can be better employed than in hunting these matters up.

And with regard to the drawings you send out to the works, you will remember that what you show is far more important than how you show it, and so you will make your drawings as practical as possible, and write all instructions on them the workmen are likely to require, and you will be comparatively unconcerned as to how your building looks on paper, provided you can see in your mind's eye it will look well in reality. An architect's work is his building, let him produce it how he may. The beautiful drawings of the late J. F. Bentley, shown here a short time ago, had never been seen before, his one desire being—so Mr. Ingress Bell, who knew him well, tells me—that he should be known by his work and nothing else.

I have not even now enumerated half the branches of study in which you will have to instruct yourself; but, lest you should feel it an impossible task, I may say that you will find, as you master first one and then another, these subjects will dovetail one into another so that you will gradually, perhaps almost unawares, become a well-informed man.

Then you will travel, of course, when the opportunity occurs. The caution given in this room by Sir Laurence Alma-Tadema a short time ago did not apply, you will see, to foreign travel generally, but to travel undertaken too early in your career and before you know your own country.

And then, in addition to all this, you will practise scrupulous integrity towards your employer, employed and professional brethren, and you will never do anything you would prefer your client not to know about (for that is a safe rule when you are in doubt). You will, I am sure, endeavour to be courteous, upright and modest in all your work, not always seeking your own advantage, and so you will raise yourself and your calling and become what we call an English gentleman.

You will not, if you are wise, be content to let your art stay where you found it, but you will go on and on and carry it, as far as in you lies, a step further; you will become a "true lover of the past who does not scorn to take good heed to what the future saith," and so you will not work in vain.

It is easier I know—no one better—to say all this than to do it. Nothing worth doing was ever yet easily done; lifelong work is required, and I end as I began. You will do no good thing without it, and get no enjoyment either without it. The possibilities of life are nearly endless, and they depend mainly on yourselves.

Remember that the pursuit of architecture is a serious pursuit. Some buildings seem as if put up for mere fun; you will not treat your art so I am sure. Play and fancy in the detail there may be, but the main structure must be sober, with an evident idea to impress or to attract.

Ruskin tells us "it is sympathy and imagination that make the artist." Cultivate, therefore, both, and you may leave behind you something that has been worth the doing. And doing is the principal thing—don't think over much, but try.

Mr. WALTER MILLARD read a

Review of the Designs and Drawings submitted for the Prizes and Studentships, 1903.

In compliance with a request from the President, which I take as a command, I will endeavour to give in the form of a short criticism some of my impressions on making an exami-

nation of the designs and drawings submitted this year for prizes and studentships. Whilst deeply sensible of the honour of being invited to follow those who in former years have discharged this most responsible duty, and keenly conscious of the extreme delicacy, to say nothing of the difficulty of the task, I will nevertheless waste no vain words on misgivings concerning my own fitness for it, but will proceed forthwith to the expression of thoughts provoked by the exhibition we have been holding. I may say that my opinions on this were formed independently of the prize awards, and indeed, I think, by any awards had been made.

Following the printed syllabus of prizes and studentships we find the Essay Medal put first. The subject set for it is "A comparative review of the various past and present systems of architectural training at home and abroad," has a special interest—we might almost say a vital interest for us, now in particular; and one can only hope it may have attracted competitors qualified to treat it adequately in spite of the rather vast and comprehensive nature of the title. I have not had the opportunity of reading the essays; but I would point out that any review of the subject could scarcely fail to note the far-reaching fact that as a corporate body, "for the general advancement of architecture and for promoting and facilitating the acquisition of the knowledge of the various arts and sciences connected therewith," this Institute bears no direct or active part in the work of teaching and training recruits to our profession; leaves them, in this respect, to the ministrations and management of anybody who undertakes "to teach and instruct to the utmost of his skill and knowledge in the art and profession of an architect—in consideration of, &c." Rightly or wrongly the Institute does not train; it provides the course, the hurdles, the water-jumps. In the exhibition just held we have brought up before the Institute for trial and judgment the results of architectural training obtained elsewhere—and where, training for which the Institute as a body assumes no responsibility; acting rather, so to speak, as a fountain of honour.

For the Measured Drawings Medal three sets only are submitted, none of them illustrating a subject earlier in date than the seventeenth century. Considering the immense value of more respects than one, of the faithful delineation of existing examples of our old architecture, of all dates, might not be worth while to increase the sum of money awarded with this medal, from ten guineas to something nearly approximating to the bare value of the labour of draughtsmanship required to portray worthily a good subject as in the case of most well-conducted competitions nowadays. The author of the drawings of Craigievar Castle, Aberdeenshire, neatly lays open for us by his plans and sections inside of a delightful-looking residence. In rather sharp contrast with his geometrical drawings are his pen-and-ink perspective views of a subject that deserved drawing, marked by peculiarities of penmanship which he should hasten to un-

What a lesson to us all in the quality of restraint in architectural excess do these Scotch castles afford. How they seem to do without much detail externally, and happily the detail that is used is concentrated exactly where it means most and tells best in the composition as a whole, whilst internally how home-like and cosy everything seems with thick enclosing walls and a good blanket of rough-cast to the weather face. The two other competitors illustrate respectively Ball's Park, Hertford, a square, brick-built house about A.D. 1641, apparently much modernised inside, and a church of St. Martin-in-the-Fields, London—its tower excepted a rather large omission. Neither set strikes one as a convincingly faithful rendering of its subject; and of what is an unfaithful rendering? I would ask. The author of the former, whilst ruling innumerable lines to denote brickwork, ignores all jointing in what appears to be masonry, whilst telling us if it be only stucco; the author of the latter, in full-size mouldings, fails to indicate a single bed-joint where he happens to cross one in section—a point in masonry altogether negligible. His longitudinal elevation and section of the church in one or two small points do not agree quite the same story—a minor matter, perhaps, but significant.

The subject for the Soane Medallion being a "Design of a town church" on a corner site of 140 feet by 90 feet, attention of competitors was called to the remarks on church planning in Sir William Emerson's Presidential Address of 1901. This, alas! seems to have proved, indeed, what Butler would have described as "strong meat for babes;" at any rate about one-third of the twenty-one competitors, several of whom, ablest among them, appear to have considered themselves thereby licensed to arrange for the choir of a modern church—presumably a parish church, whose choir would hardly consist of individuals "in orders"—to sing away by themselves up at the extreme east end of the building, having in cases interposed between them and the congregation the backs of one instance by a high redos, and surmounting others by a big, four-legged baldachino. But waving discussion of this question, let us view the designs themselves.

There is still scope for "Advance," to act up to his motto. He has allowed himself to be dominated by the idea of an octagonal octagon for his plan rather than by the real conditions of the problem of designing a church for that particular site.

In like manner "Bee" goes astray on different lines. He needs at all costs pile up a soaring central tower and, borne aloft over the middle of his church on four thick piers, perhaps the least convenient plan of all others for a town church. After indulging to such an extent as he does in such Gothic detail, he ought now to pledge himself to abstain from detail for awhile. "Como," taking a wider base, also goes for a good central pile-up, resulting in a terribly tall interior. He may fear it would not result in a good church for working purposes, if that be of any consequence. "E Natura architectura" means at least to be practical, with his concert-room falling eastwards, his steel-framed roofs and extract ventilation tubes. At first sight the general lay-out looks well; yet after all his interior would prove gloomy, even if his neighbours did not block his northern lights. "Fides" produces a church plan without indicating any site, so it is difficult to say how it would do. The design by "Fioretto" shows some largeness of idea, and is altogether cleverly executed, but his building is crowned by a needlessly ungainly dome, all out of scale, both internally and externally, with the rest of the architecture, which is too good to be so handicapped. The painting he proposes might doubtless do something to help matters internally. The sort of work shown by "Dien" is hardly deserving of encouragement, the more so as it looks like the result of bravado than of incompetence. Freehand drawing in his perspective view amounts to little more than an affront to the beholder. "IXΘΥΣ" has done an admirable thing in Byzantine planning and detail, showing in a good set of drawings much careful contrivance, no slight knowledge, and a real architectural ability that commands respect. Whether he could add to our happiness to see it all built to-day is another question. "Lauda Finem" strikes one as a man who knows his own mind and has the power of giving effectual expression to his ideas. We may question a few points in his design, but must allow that he handles his architecture like an expert. He can draw, too, his perspective view surviving the uncomfortable-looking background of furnace vapour in which it is relieved. "Medici" is one of several who waste their site-area in attempting, more or less ineffectually, to make some pet idea work; so the real problem of designing a church on that site, and that alone, is evaded, not solved. "Neni" wastes his main area by a barrel vault so wide in span that he is short in the other direction that he might have made a dome of it at once. "Ne oubliez" plants a fairly tall tower in the wrong position, on the external angle of the site, thus swamping his church. He is too bold with his tower and too modest with his church. "New Era" makes a well-made effort to put into good form, in his own opinion, the particular site lessons learnt—in the best sense—from Bentley's Westminster Cathedral; learnt from a building rather than from books, the way good work ever was done. He skilfully utilises every inch of the site, and, but for his debatable position of the choir, would work admirably, producing a striking and even impressive interior in spite of the unavoidable shortness of the whole building. Evidently the author has had the happy audacity—and he is the competitor who has—to treat us to a pair of towers: a sure way of obtaining a telling effect in a building mass, and stamping it with distinction. This almost sets one at fault—though it may be heresy to say so—that such a scheme might have been carried out in the case of the Westminster Cathedral itself. With two towers you get the emphasis, and something more. The play of light from one to the other, is a charm to count on. The design by "FOINIE" fits the site, but fails as architecture. "Everando" produces a working plan, filling the site and giving an interior that would have some scale and mystery to it. He hampers himself by the fancied necessity of a central tower and of supporting this by transepts, as well as such only externally with any effect. He has learnt to unlearn in the use of detail as well as in manner. "Rodari" too obviously attempts to squeeze a circular church on to a plot of building land not selected for the purpose. The exact purpose of his tower is not clear, seeing that there are no belfry openings to speak of. "Sanctus" might have tried twin towers with advantage in his design, and at the same time, perhaps, have better escaped recalling quite lately a published design. One is checked in smiling at "Seres" and his legions of columns by his evident nervousness. "Xa" and "Xb." base themselves somewhat on Pearson and Sedding respectively, and afford an interesting parallel of stone-vaulted churches. The main disadvantage of "Xa's" building is on right lines for appropriate unified effect, though no tower appears worth mentioning. His massing of parts is good, but the repetition of book tracery and other detail would be wearisome in execution. He and also "Medici," perhaps with some pro-

phetic insight, put their choir and organ at the west end. "Xb's" is, on the whole, a consistent and well-threshed-out design, with just a tendency to fussiness in detail in too many places at once. A little might be left out with advantage. His east front would have risen still more majestically above a quieter treatment of the low building at its base. The tower, planted exactly in the right position for it, is quite a noble feature—a good tower for a town church. Lastly, "Patriarchal Cross" plans a church for the site, and tries to solve the old problem of how to reconcile and make the best of both aspects of a cupola, the interior and the exterior.

For the Tite Prize this time it may be said that the authorities did "a stately pleasure-dome decree," setting as the subject "A pavilion in a public garden." Competitors might go as they pleased with regard to conditions of site and surroundings, certain accommodation only being required; but the designs must be in accordance with the stipulation that the trust fund be applied "in such manner as the President and Council shall deem best calculated to promote the study in England of Italian architecture," as that slightly ambiguous term was understood by Sir William Tite. So, altogether, there is rather less air of stern reality about the fourteen designs for this competition than about those for the Soane.

"Altiora," "Archivolt" and "Ariel" play with architectural forms more or less prettily, but not to exceptionally good purpose, though "Archivolt" has some good points in a disproportionate whole. "Caber Feidh" has designed a building that holds together consistently and has marked character. Why he should think it necessary to put a row of glazed windows in his frieze above a range of open arches is a mystery, his section showing how futile they would be for lighting purposes and how needless. "Forum" has composed a group too fussy to be fine architecture. "Le Nord" produces a straightforward piece of architecture, soberly and sensibly designed. "Lindisfarne" secures apparent unity in his design, which, however, will not bear close scrutiny. "Lux" has had a big cupola to work off—not a bad one, by the way, to look at; but, would it stand, especially on the ground-floor supports shown? Otherwise his architecture is well handled. "Mime" and "Muciber" have done exercises in the grouping of architectural forms radiating on plan from a central cupola. "Pax" denies himself a perspective view, so that full justice is scarcely done to the merits of his thoughtfully laid-out piece of architecture. In the same way, of course, some of its weaknesses too may escape disclosure. The design by "Phoenix" is unassuming and so far welcome, whilst that by "Queen of Hearts" comprises too many different ideas to be quite happily combined and to hang well together as one thing. "St. Winifred's" design would not make good architecture if it could get built as shown.

The Grissell Prize, "For the encouragement of the study of construction," attracts eleven competitors, most of whom seem to consider that the solution of a constructional problem cannot be complete without involving an exercise also in the art of manipulating purely architectural features and detail. Can it be that the display of this latter accomplishment is thrown in as a make-weight?

In working out the "Design for a stone dome over a porte-cochère to a large public hall" "Blunderbuss" indulges in some sculpture as well as architecture, after attempting a version of Wren's cupola construction at St. Paul's, all in stone, without getting sufficient room between the inner and outer shells to enable the cone really to carry the lantern. "Red Rose" is far less ambitious of showing any ingenious system of construction, whilst giving us architecture so charming that I think Wren himself might have put his name to it and not been found out. "Duomo" conceives a simple dome, and then proceeds to hide it all up externally by architecture of the Ionic order. In addition he provides and sets a statue on plan. "Golden Horn" draws a bare outline section of a dome with no visible means of construction about it—not a joint; which is the more remarkable because his architecture below it is depicted more or less as it might be built. He is careful to specify the arrangement of the electric lighting. "H.I.M." is one of two competitors who venture to complicate the constructional problem by introducing daylight into their dome above the springing. His architecture itself hardly justifies its intrusion into the question. "Notts" sticks closer to the problem of constructing a dome, and determines that it shall carry a stone lantern on the crown. To make doubly sure as to this he thoughtfully provides and shows, outside, at the springing, a "tested steel cable, coated with Dr. Angus Smith's solution, and afterwards well tarred." "Quercus" also carries a stone lantern, and at the same time pierces his dome for light. He makes some show of architecture. "Civic" goes into the constructional question with calculated diagram of stresses, line of pressure and specification of mortar. "Wrot iron ties," as he calls them, help to ensure that his stone lantern at the crown shall remain *in situ*. "Sepia" tackles the rather awkward problem of draughtsmanship, if not of construction, involved in the

crossing and impenetration of arches to form pendentives, such as we see in illustrations of certain domes in India. His dome proper, raised above these arches on a pierced drum, forms another problem, over the solution of which he expends far less effort. "White Rose" has a double-shell dome carried by architecture of no mean order, ably delineated. Finally, "Z" would have timid visitors received, on alighting from their carriages, by four semi-draped human figures in stone of colossal size, standing up in the gloom of the four inner angles of the porch, performing the office of pendentives by carrying on their bowed necks and shoulders the circular cornice, from which a simple dome springs.

Three men compete for the Owen Jones Studentship, "Founded for the encouragement of the study of architecture, more particularly in respect to ornament and coloured decoration." Mr. Guthrie shows useful studies from St. Mark's, Venice, St. Vitale, Ravenna, Granada and elsewhere. His original design for the decoration of a domed chamber suffers in the first place from too many sources of inspiration. It lacks unity among other qualities to be desired. Mr. McLachlan, in a slight but illuminating sketch to scale, lays open to us from end to end that wonderful interior of the Capella Palatina, Palermo. It sets us asking for more. The mosque at Cordova and Sta Anastasia, Verona, afford him subjects for other clever drawings; whilst it is satisfactory to find our own country also represented by examples from Canterbury and Ranworth, in Norfolk, and by the ceilings of that great Suffolk church of Blythburgh. Mr. McLachlan does not venture on a design of his own. Mr. Percy Nobbs relies mainly on one, viz. "A scheme for the mosaic decoration for a church of the form and scale of Sta Fosca, Torcello," a most appropriate subject to choose. It is easy to imagine that his scheme might be made to work out even more successfully and impressively than his slightly inadequate representations of it would warrant one in supposing. His treatment of broad belts of gold-ground mosaic below the blue-ground mosaic of the main vaulting surfaces seems a happy combination. Evidently he knows what mosaic decoration is, and has found how difficult it is to illustrate by small-scale sketches.

The Pugin Studentship, "For the promotion of the study of the Mediæval architecture of Great Britain and Ireland," is awarded, on conditions, to the author of the best selection of drawings and testimonials. Mr. Harold Gibbons goes the right way to work in his survey of Cheetham's Hospital, Manchester, which, as regards a good portion of the place, he takes up as a whole and dissects for us, showing its anatomy and its build, all illustrated intelligibly, if not exhaustively. Likewise he lays hold of the interesting, stone-roofed church porch, of two storeys, at Leverington, Cambs, making a fairly complete study of it as a self-contained piece of architecture. His quarter-full-size pencil drawing of the Heckington sedilia, finished, as he tells us, on the spot, is a thoroughly good study, so far as it goes without a section, of a fine subject. Mr. Gordon's sketches and drawings have about them rather too much the air of having been made for show in the first place, and, secondly, for the purpose of study of the work itself. Nor are they conspicuously good even for the former purpose. Mr. Hamp pursues his outdoor studies in architecture as so many of us have been guilty of doing, viz. by making a great variety of little perspective views of buildings and bits of building. He should, at any rate, make better ones, to justify his procedure. Of this particular line of study Mr. Milne is also a devotee, though, like Mr. Hamp, he grants some slight concession to possible prejudice by submitting a scale drawing or two. Mr. Mears has much more to show on similar lines; but besides some needlessly muddy sketches, he gives us, to 1/4-inch scale, drawn rather slightly, the steeple of St. Mary's, Oxford, from bottom to top, as well as several interesting coloured drawings to scale of Norfolk screens. Mr. Muir's strainers are mostly filled by measured drawings; and, as drawings, very taking one or two of them are, touched up by skilful brushwork, with shadows deftly cast and high lights cunningly left, all at the draughtsman's own sweet will. Other drawings of his look more workmanlike. He might now go on, with advantage, to studying works of architecture rather more *in toto* and a little less in tit-bits. Mr. Myrtle Smith has a good, miscellaneous show of regulation sketches, with a sheet or two of measured work thrown in—for propriety's sake, perhaps. Mr. Westwood does give, besides many little pencillings, pretty and otherwise, a set of measured drawings of a whole church; not, indeed, one of first-class importance architecturally, but possibly with more of real interest in it than one might suspect from a glance at these neat-looking but not quite exhaustive drawings of his. For instance, he blacks in his plan throughout, as though the entire church, as it stands, were all the result of one building effort, which is improbable.

I have deemed it a matter of some importance to try and notice, however briefly, the work shown of every competitor for a prize or studentship. Of our winners of studentships the holder of the Godwin Bursary is surely the one most to be envied by men of his own time, since he goes forth to study

and report on the real thing, the work of to-day done by his men. To think of our sending out one student only a year, such a mission. To be sure, the study of the work of to-day in our own country is barred to him by the conditions of the bursary, for which any British subject is eligible.

To sum up, I cannot help wondering a little with what feelings would some of the pious founders of our prizes studentships have viewed the exhibition, and in what way would they have given expression to their feelings? As it is, from questions of architectural style, would they have been content to observe a large proportion of the designers starting with some preconceived idea and a stock of architectural trimmings to dispose of, to evolve designs apparently without intelligently grasping anything like the full significance of the problem to be solved, as set forth by the conditions; going the wrong way to their work from the first and often gratuitously creating difficulties for themselves, perhaps for the purpose of getting over them, but then failing to do this, as Mr. I suggested was the case last year also? Or would the founders have been any better pleased in looking at certain of the representations of old work, wherein some facts are distorted and others left doubtful, when they might be clearly told, evidenced not only of slipshod ways of drawing old work, but, furthermore, of a superficial way of regarding it? I must not just a single instance of this want of thoroughness because it is typical. One competitor begins to treat full-size, in elevation and section, a moulded arch-bar; but so far from going through with the thing and telling us the depth of the bar by giving its complete section, he is satisfied to give the moulded edge only, with going even so deep as the plane of the glass itself which the bar is designed to hold. This is characteristic of much of the draughtsmanship in vogue, professing to be workmanlike. What is an architect, or a student of architecture, if he be not really workmanlike in his methods of work and study? The root of the evil I fear we must go further back than to individual students themselves. To a quite considerable extent these are yet untaught and untrained in right method of study; how to learn they have never been taught.

In other callings the cry goes up for efficiency; is this less needed in ours? But an architect of whom it could be said that he was efficient would not thereby necessarily be entitled, in the fullest and highest sense, to recognition as an architect. For this he must add to his indispensable practical qualifications something that we try to describe by some term as artistic ability, but for which term I would prefer to substitute another, viz. the appellation of that rather indefinite quality which in parallel branches of human knowledge, human endeavour is generally understood by the word scholarship; a quality based on sound knowledge, yet compounded also with something more than mere knowledge—the crowning result of a process of training rightly applied to draw out to best advantage those finer instincts with which every student may have been endowed by nature. If I may presume to suggest for the architectural student two words, these would be scholarship and efficiency. Without one he can be no true architect, without the other he will be a sorry architect indeed.

The PRESIDENT then distributed the prizes and awarded the successful competitors. The list has already appeared in *The Architect*.

Mr. SOLOMON J. SOLOMON, A.R.A., proposed a vote of thanks to the President for his address, and to Mr. Milla for his criticism on the drawings.

Mr. JOHN BELCHER, A.R.A., in seconding the motion, spoke of the importance of sketching buildings *in toto* and said that if buildings were studied as a whole the student would not fail to grasp the meaning of the various parts and to acquire a faculty for rhythm and harmony of detail and a sense of proportion.

CRETAN PICTURE WRITING.

IN his third and last lecture at the Royal Institution on "Phœnician Writing in Crete, and its Bearings on the History of the Alphabet," Mr. Arthur Evans said that by the two definite systems of Cretan writing—the pictographic and the linear—there was a variety of isolated signs or marks on pottery and other materials. Similar marks were found in Egypt distinct from the hieroglyphics, and going back to historic times. These signs were of geometrical form, anticipating alphabetic shapes, and stood really nearer to the origin of letters than the elaborately carved hieroglyphics of a more civilised age. The Cretan evidence supplied a standpoint for examining the vexed question of the origin of the Phœnician alphabet. The earliest Phœnician monument like the Moabite stone, went back to about 900 B.C. The earliest traces of the use of Phœnician letters by the Greeks might be traced from the eighth century. On the other hand, the recent discovery of Sabæan and Minæan inscriptions in South Arabia tend to throw back the date of the origin of the Phœnician alphabet.

We might suppose, then, that the Phœnician system was already in existence by about 1200 B.C. From what source, then, did the Phœnician alphabet originate at some time about this approximate period? De Rougé attempted to derive the Phœnician letters from Egyptian prototypes. By an eclectic process he sought these in certain hieratic forms of a much earlier period, making the Phœnicians rename their letters according to a fancy system. This theory was popularised in England by Dr. Isaac Taylor, and still might be said to hold the field there, though the objections to it seemed to be unsurmountable. Even less happy had been the attempt of Peiser and others to derive the alphabet from cuneiform characters. These early quasi-pictorial characters of old Chaldæa had vanished some 3,000 years before. The old simple theory of Gesenius and his followers that the Phœnician letters were derived from the pictorial objects suggested by their names seemed on the face of it more natural than the artificial theory of De Rougé. A table prepared thirty years ago by Sir John Evans for the Royal Institution showed how easily the derivation from these pictorial originals might be effected. It was, therefore, highly interesting to find among the Cretan characters a whole series of pictographic forms answering to the prototypes of the Phœnician letters as conjecturally drawn in accordance with the meaning of their names, so far as could be interpreted, and in some cases accompanied by similar linear simplifications. A still more interesting question arose—Did the Cretan evidence supply something more than a parallel example? There was an agency at work which brought Crete and the Ægean world that it dominated into a direct relation with Canaan during the very period of alphabetic incubation. The Biblical and Egyptian records both agreed in bringing the Philistine tribes from the "Isles of the Sea." The Southern tribe of Philistines, the Hebrew Cherethim, were translated "Cretans" in the Septuagint, and their chief city, Gaza, preserved the Minōan name and the cult of the Cretan Zeus to classical times. New Egyptian evidence made it almost certain that the mysterious Kaphtor was really Crete, the Egyptian Keftō, and the Kefts, the highly civilised people who bore offerings to the Egyptian kings, had now reappeared in the wall-paintings of the Palace of Knossos. The Philistines derived from this side must be looked on as representatives of what was in many respects a higher intrusive culture from the West, and the Cretan evidence showed that they must have brought with them a highly developed system of writing. Much must still remain hypothetical, but in the absence of any other satisfactory source for the elements from which the Phœnician letters were selected, the identification of the Philistines with a highly civilised Ægean race far advanced in the art of writing became an extremely suggestive fact. Nor was it without significance that during the same period another parallel wave of colonists from the Ægean implanted the Mycænæan culture into Cyprus, and introduced there a syllabary showing points of conformity with the linear script of Knossos.

NORTHERN ARCHITECTURAL ASSOCIATION.

At a meeting of the Northern Architectural Association held at 36 Northumberland Street, Newcastle, Mr. Ralph Hedley, R.B.A., gave an address on the subject of "Sketching in Charcoal." Mr. Frank Caws, Sunderland, the president, occupied the chair, and briefly introduced Mr. Hedley, who made the remarks he was about to make on sketching and designing in charcoal were principally addressed to students. He did not pretend to tell them anything new. Charcoal had been appreciated by artists for ages, but he did not think it had been quite sufficiently appreciated by architects. The reason why he advocated charcoal so much for drawing details whatever kind of decoration was required was because it lends itself so readily to what one desires to express. Delicate, soft or sharp lines, broad and delicate tints, broad and decided shadows could be produced with charcoal with much more ease than with ink or pencil. With charcoal they could give all relative planes, any required depth or strength, quality and feeling. This was of the utmost importance, and would enable details to be understood at once—that was, projections and sinkings—if great care was taken to imagine a light coming from either the right or the left. In showing relief in a design if they got the light full on it was rather deceptive when it was handed over to be executed. It was often very difficult to know whether the signer of some piece of ornament intended parts to be concave or convex without showing a section, and it was quite impossible to show sections in delicate parts of foliage. If a detail was thought was displayed in drawing it could be expressed and understood almost as well as working from a model in relief. It was extremely difficult to express with pen or pencil full-sized drawings. By the pressure required and the trouble involved in drawing a great number of thin lines all freedom was lost, and with freedom certainly individuality

must be lost, and he thought every drawing of decoration should have individuality. The easiest way of getting individuality was by working with something that expressed their thoughts, and they could not help themselves if they used charcoal freely. Their own feeling was bound to crop up. He would show them, as well as he was able, what he thought was the best manner and how to get at a workable drawing, say, of a caryatid. Mr. Hedley then made sketches from a living model, with explanations, and at the conclusion of his demonstration he was accorded a very hearty vote of thanks.

ART IN SCOTLAND.

THE Scottish Arts Club entertained at dinner Mr. James Guthrie, president of the Royal Scottish Academy, and Sir R. Rowand Anderson, H.R.S.A. The chair was occupied by Mr. W. D. M'Kay, R.S.A., president of the club.

The Chairman, in proposing the health of Mr. Guthrie, said that he had recently been raised to the highest position the art world of Scotland had to bestow. Amongst all the great men who had occupied that position, he (the chairman) made bold to say that not one had been better equipped by nature, by training and by culture than Mr. Guthrie. Mr. Guthrie was a painter of European reputation, and already possessed more honours than most men attained to in a lifetime. Mr. Guthrie was first known among them as the leader of a new school, having its headquarters in the west, and, as was inevitable both from the novelty of the movement and from its local habitation, there was at first some friction. But within a dozen years or so of its first appearance, most of the leaders of the Glasgow school were on the roll of the membership of the Academy. It would have been an evil day had it been otherwise, for an art which was not from time to time revived by new influences was doomed. There had been times when the honour conferred on the President more than balanced the duties and responsibilities imposed—times when all things were going smoothly and well—but assuredly the present was not such a time. It was just because it was a time of stress and strain, when the art-future of Scotland might be said to be in the crucible, when the most careful steering would be necessary if they were to weather the shoals and cross-currents which seemed to be all about them, and that Mr. Guthrie's qualifications seemed to fit him for the task, that they had called on him to take the helm. In responding to their call Mr. Guthrie had taken upon himself no light burden, and gave at least as much as the Academy had to confer.

Mr. Guthrie, P.R.S.A., in replying said he was extremely grateful to the Club for the honour which they had done him. The position to which he had been called was one of considerable responsibility, and he doubted if he was very well qualified to fill it. He felt nothing but gratitude to his fellow members, not merely for having put him in the position of President, but for all the kindness that had been extended to him since he was asked to take the chair. However much he might succeed, or however much he might fail, no one could have started on the arduous work that lay before him with greater good feeling and goodwill than had been extended to him by his fellow members of the Academy. The Chairman had spoken of him as representing a movement with which undoubtedly he had had a great deal to do. He did not think that they in Edinburgh would think any more of him if he were in the least degree to repudiate his connection with it. He was extremely proud of his association with those men in Glasgow, but he felt that he had been the one whom the force of circumstances in connection with it had brought most to the front. He could tell them that with the position he now occupied he would do his very best not merely as one from Glasgow but as one who had the interests of art in Scotland at heart. It would be his endeavour not only to do justice to anything that might be done in Scotland, but to try to link the art of Scotland as far as possible to the art of the world outside. He would try to do that, feeling that if they were not linked to the art of the world at large they would lose their proper status. He wanted to bring the art of the world into their exhibitions. They could only do that to a small extent, but if they got a few pictures from the greatest masters, putting them beside their own pictures, they would at least learn how they stood. And if they stood well, it would disillusion people and prevent them from speaking of everything outside of London as merely local.

Professor Baldwin Brown proposed the health of Sir Rowand Anderson. He congratulated him on the royal favour which had recently been bestowed upon him. He hoped that the result of the investigation now proceeding would be to lead to the preservation and extension of what was good in the existing institutions.

Sir Rowand Anderson said that what they had heard from the President that night must convince them that a most fortunate selection had been made, and that Mr. Guthrie

would maintain the institution over which he now presided in that high state in the public estimation which was necessary for it to fulfil its mission. He (Sir Rowand Anderson) had always put before himself a high ideal of the art he followed, and had endeavoured to translate these ideals into realities. He could look back on a fairly long professional life, and if he was asked to state any particular point that had characterised the history of architecture during that period, he should feel inclined to point to the rapid and successive changes of one phase of art in favour of another. These, to his mind, were making their art rather too much of a fashion and less of a tradition. They now spoke in many languages, and sometimes the confusion of tongues was very great. They had arrived at a period of what they might call free trade in art. The public must get what they chose to pay for, and, added to that, a school of artists had arisen who, rejecting all tradition, looked upon themselves as apostles of a new revelation in art. Their output had been considerable, and much of it was made in Germany. He believed their mission would be a barren one. They must, however, put up with their eccentricities and their cult of crudeness and ugliness, but the public, he believed, would soon come to recognise that art, like everything else in this world, was governed by the laws of evolution, and was not the product of invention. In spite of all that confusion there was much good work being done, and one very hopeful sign was the increased desire there was to bring the arts of sculpture, painting and architecture together, and by their co-operation to produce greater and more complete works than they had hitherto known. Referring to the applied art school, Sir Rowand said that the education of the rising generation of architects and all engaged in the decorative and industrial arts had been long a subject to which he had given much attention. He could truly say that the work of the committee had been a labour of love to all its members, and the success of the school had been owing to the very practical system of teaching they followed, and the soundness of which had been demonstrated by its results. He expressed regret that the municipality, which in former years generally supported them, had withdrawn the subsidies given to the school and to others in order to apply the money to an infinitesimal relief of the rates. The intervention, however, of the Parliamentary committee now dealing with the Board of Manufactures had, of course, very much altered the situation, and as soon as their report was published he trusted that a united and vigorous effort would be made to establish in Edinburgh one fully equipped and comprehensive art school by the amalgamation of all that was best in the existing schools. They should then be able to offer the best education that could be given to painters, sculptors, architects and all engaged in the decorative and industrial arts, and he appealed to this representative company to aid such a movement, so that they might have for Edinburgh an educational institution for art the same as they had for law, divinity or medicine.

ALL HALLOWS CHURCH.

THE Commissioners appointed under the Union of Benefices Act (23 and 24 Vict. cap. 142) to inquire into and report upon the expediency of uniting the contiguous parishes of All Hallows, Lombard Street, &c., with St. Edmund the King, Lombard Street, have sent their report to the Bishop of London. Such commissions are composed of two clergy nominated by the Bishop and one nominated by the Dean and Chapter of St. Paul's and two laymen nominated by the Court of Common Council. After giving details of the population, church accommodation, expenses of Divine service, patronage, parsonage houses, &c., of the two benefices, the Commissioners report upon the income of the respective incumbents. The gross income of the two benefices is 4,121*l.* (St. Edmund 1,404*l.*, All Hallows 2,717*l.*). On the first avoidance of the rectory of St. Edmund a sum of 614*l.* a year out of the rector's income passes to the Ecclesiastical Commissioners for church purposes. The income of All Hallows is now reduced by deductions in favour of poorer parishes amounting to over 1,450*l.* a year. The Commissioners, who recommend that the union should take effect, suggest that 750*l.* a year, with a residence in Finsbury Square, will be sufficient for the incumbent when the present life interest lapses. They also recommend that St. Edmund the King, Lombard Street, should be the church of the united benefices, with Canon Benham as incumbent, All Hallows being vacant by the death of Canon Rawlinson; and add that, if their suggestion of 750*l.* is accepted as the figure for the stipend of Canon Benham's successor, there will be a further sum of 1,300*l.* a year to allocate to poor parishes, while 470*l.* which All Hallows has received for the upkeep of Divine service can be applied elsewhere where it is more needed. As to the church and site of All Hallows, they recommend that these be sold by the Ecclesiastical Commissioners and the property developed in connection with the frontage premises in Gracechurch Street, which are also ecclesiastical property.

The proceeds, they suggest, should go to the building of churches in poor districts under the direction of the Bishop of London. The first of these should be called All Hallows, should be built on lines as nearly as possible similar to those of All Hallows, Lombard Street, and should be furnished with the splendid carving and fittings of Wren's church; as other churches are built, the names of the other five parishes comprised in the union should be attached to them in succession, and wherever possible parsonage houses should be provided for the new benefices. The report is signed by all five Commissioners, but one of them adds a reservation that in his opinion the Commissioners have not been sufficiently informed of the relative values of the St. Edmund's and the All Hallows' sites, so as to be able to say which could be the more profitably disposed of. The report is now being considered by the Dean and Chapter of Canterbury, and in due course the Bishop of London will present such proposals as he may think fit to the respective vestries.

EDINBURGH CITY CHAMBERS.

ACCORDING to the *Scotsman*, Mr. W. Hole, R.S.A., has just finished the first of a series of panel pictures for the decoration of the new banqueting-room of the City Chambers. The series, as was stated at the time the scheme was arranged, is to consist of representations of prominent historical incidents in the life of the city, and the first that has been selected for execution shows the crowning of King James II. at Holyrood, 1437. This was the first-recorded coronation of a Scottish king which had taken place at Edinburgh, and in a manner it set its seal upon the city as the capital of the country. Stone was the palace where former monarchs had been crowned, but for the time it was much too near Perth, where James I. had just been so brutally murdered by a section of his discontented nobles. The queen, who belonged to the Royal House of England, had, after the king's assassination, escaped with her young son to Edinburgh, and the coronation ceremony had been hastily performed there in the Chapel Royal of Holyrood. In the picture the youthful James, who was only six years of age at the time, is represented not in the act of being crowned, but of receiving the homage of the prelates and nobles. The chair of State is set upon a dais at the junction of the chancel nave and transepts, and the grey stone pillars, arches and other architectural accessories make an admirable background to this courtly scene. The covering of the dais is of rose colour, with emblems in gold wrought upon it; the chair is of Gothic type with three finials. The king is a sweet, chubby-faced boy, with fresh complexion and fair hair, the flowing locks of which escape from below the crown which is upon his head. He is attired in a red silk tunic and ermine cape, while the royal robe of purple escapes in graceful folds on the right of the chair, and spreads itself over the dais. He wears the Collar of the Thistle. Between the crown and his brow is what looks like a kerchief tied around his head. This is the "amice," which was worn for a certain time after coronation to preserve from being rubbed off the sacred chrism, with which in the crowning ceremony the forehead was anointed. Kneeling in front of the youthful monarch is a venerable prelate with mitre on head, and wearing a cope of cloth of gold. The contrast between the boyish king just entering life and the aged ecclesiastic who must soon quit it is very impressive. The group on the left includes the queen, a young maid of honour, and a number of prelates and nobles waiting their turn to tender their homage. Over their heads are carried croziers and crosses, the emblems of ecclesiastical authority. The queen is a prominent figure in her royal robes, on which the arms of England are impaled with those of Scotland. She wears a quaint head-dress, and her maid is also distinguished by a striking, high-pitched coiffure. Behind the kneeling archbishop is the figure of a young noble in the elaborate wide-sleeved dress of the period in blue and gold, who comes well into the picture. In the group on the right, placed behind the chair of state, the leading figure is that of the Lyon King in his herald's surcoat, and wearing his crown, proclaiming the names and titles of the prelate and nobles as they advance to the royal presence. Beside him is a kneeling herald or pursuivant, with white wand, and behind him the bearers of the sword of state and of the golden spurs. In the background on the right, under an arch, is a venerable figure carrying a cushion on which rests the sceptre. In a gallery on the same side, between two of the pillars, with the front draped in soft colours, is a sprightly and interested group of the ladies of the Court. The picture is an excellent example of what a historical painting should be. It is happily and vividly composed, the figures, well drawn, are imbued with life, the details of costume, of furniture, and of armour belong to the period in which the incident occurred, and the group altogether has a gracious and regal aspect. From the decorative point of view the picture is also a success. The colour is of pure and delicate tint, forming a most agreeable

harmony, and giving to the work the feeling of a beautiful piece of tapestry. Executed in spirit fresco the tints are necessarily flat; and the work when in position should form an admirable piece of decoration to the end of the banqueting-room. In size it is about 8 feet square.

TRANSVAAL ARCHITECTURE.

THERE is no cosier spot for conversation, says Mr. E. Strangman in the *Rand Daily Mail*, than the stoep of a Dutch farmhouse. Alike in Cape Colony, in the Orange River Colony, and in the Transvaal, the Dutchman, when building his house, seems to have been influenced by climatic considerations to a far greater degree than his British rival. The walls of the Dutchman's house are thick, the rooms are cool, the stoep extends that view which, with variations, is the same throughout South Africa, where veld and mountain and a gigantic arm of sky commingle in one vast scheme of opal tints and subtle shadows.

It is curious to note that one of the lessons Dutchmen were competent to teach us, namely, that of the architecture of farm-houses and village dwellings, has been borne in mind but little by British settlers throughout South Africa. In Capetown and its suburbs, in the villages throughout Cape Colony, in the townlets of the northern States where Dutch influence has been unfettered, the Dutch dwelling is almost invariably the happiest combination of comfort and simplicity, built with an admirable adaptability to considerations of wind and weather. The argument here, let it be observed, is that of the superiority of Dutch dwellings over those of purely British architecture in villages and country only. The moment a Dutch village ceases to be the centre of a purely pastoral population, the moment it becomes a centre of business and commercial activity, the inconvenience of one-storeyed buildings, of houses fifty yards apart, of streets many miles in length, becomes at once apparent. Before the Transvaal knew of its gold reefs Pretoria was a smiling village, embedded in willows and water streams. The streams of water and the willows are still there, but a mass of incongruous architecture has grown up, showing egotistic influences and contradictory minds, and the original harmony of the capital is to a great extent destroyed. Of the architecture of towns the Dutch knew little. But we can afford to imitate them as far as the building of homesteads and hamlets in this country is concerned.

About the laying-out and architecture of Johannesburg what can be said? Much, but much by way of criticism. When the Dutch planned out a hamlet they planned it with a view, firstly, to the interests and comfort of the community as a whole, then, secondly, to the comfort of each individual. When Johannesburg was planned out very little thought appears to have been given to the comfort or convenience of the community. In the early days of the Rand, during the periods of uncertainty regarding the fixed continuity of the reefs, and throughout the long excitement of political strife, it is pardonable, perhaps, that individuals and companies should have thought only of themselves. As a result the architecture of the city bears the imprint of flagrant egoism. Palatial buildings rise beside squalid hovels or open on the squares that reek with filth. Sumptuous offices abound in every street and there are clubs as comfortable as any in Pall Mall, but to pass from office to club and from club to home many a sun-stricken and much-attacked square and many a foul and dusty street have to be traversed. Now that the war is over reform in these matters can only be a question of time. It should be remembered, though, that Johannesburg is situated close to the 26th degree south latitude, and therefore in seeking a model as a basis of improvement attention may well be directed to the architectural features of towns in the northern hemisphere near the same degree of latitude, allowance being made for differences of altitude.

As one passes through Johannesburg there is nothing, either in its public places or in its general features, that is reminiscent of Barcelona, Madrid or Cairo. On the other hand, there is much that reminds one of Aberdeen and Glasgow. A charge that is constantly preferred against the Anglo-Saxon is that of want of adaptability to new surroundings. The architect from Aberdeen will go on building houses just as he built them in Aberdeen, and the man from Chicago can think of nothing but skyscrapers. As to the public squares of the city, it is hard to say precisely what model would best suit them. But nothing is easier than suggesting improvements on their present state. In the central and most active portions of Johannesburg shade and protection from dust are sadly needed. It is pleasant to conceive the Market Square—with the market moved elsewhere—converted into one great promenade, circled by wide-lying arcades, and connected by wide and airy colonnades. Here what are known as continental cafés might be built and cool reading-rooms and bath-rooms, without in any way interfering with the present business houses. One of the most beautiful spots in Paris is the Palais Royal Gardens,

and these same gardens for more than a century formed the centre of the whole commercial life of France. Perhaps the wanted model is found in the Palais Royal Gardens. Johannesburg has special and exceptional advantages, which should make it not only the healthiest city in the world, but one of the most pleasant to live in. For many years, unfortunately, the percentage of mortality in this city has been somewhat high. Hitherto faulty municipal regulations and the want of a good improvement committee have been to blame for this. I am not sure that the ordinary private dwelling-house has not something also to do with it.

The usual type of dwelling-house in Johannesburg takes the form of a one-storeyed chalet, with a narrow stoep running round two sides of it. Now, nothing is finer than a stoep from which a fine perspective stretches, and which stands some distance from a public highway. Nothing, at the same time, is so trying as sitting on a stoep that overlooks a dusty road. In Madrid to-day, as in not a few of the towns of Southern Europe, many people live in buildings that have much in common with the habitations of ancient Rome. The rooms are built around a square or succession of squares. These squares are paved with marble or granite, and a fountain rises in their midst. They are open to the sky, although an awning is stretched across during inclement weather. In these places the inmates of the house pass their time. They are made cosy with rugs and conveniences of every kind, and are cool on the hottest days.

But, above all things, what is wanted in Johannesburg is a shady and well-paved square, which, though it rival not the architectural splendours of the piazzas of Spain and Italy, may at least rival them in comfort and suitability. So that, æons hence, when the reefs around shall have yielded their last ounce of gold, and Johannesburg become a city of the past, some keen-visioned archæologist, happening on the site and beholding its admirable disposition and its noble ruins, may exclaim:—"Those wonderful Johannesburgers who planned this city, history tells what extraordinarily active men they were." But to find that amongst them were men of great thought as well—that is a real discovery.

A SUSSEX "MINT" HOUSE.

THE Rev. H. M. S. Bankart, curate of St. Nicholas Church, Pevensey, who is now resident in the Old Mint House, has succeeded, says the *Sussex Daily News*, in exposing some curious frescoes in the "king's bedroom." The walls, which are of oak beams and plaster, are being cleaned and scraped with minute care, and already satisfactory results have been obtained. The Mint House itself dates from the year 1542, when it was built by Dr. Andrew Borde, the original "Merry Andrew," a quack physician and court jester to king Henry VIII. In his capacity of medical adviser, and we expect, of cheerful companion as well, he accompanied the young king Edward VI. to Pevensey, and entertained him for some time in his house there. It is in the large bedroom, then occupied by the youthful sovereign, situated above the oak room, that the frescoes have been discovered. Probably all the walls were at one time thus decorated, for traces of red ochre and other paints are visible on the beams. Mr. Bankart hopes by care and patience to find others.

So far, a painting of the same age as the house, and representing cherubim and conventional foliage, has been found in the south-east corner of the room. Another is to be seen in the centre of the same wall, but this is of more recent date, for the portion of wall on which it is executed was originally a doorway leading from the king's bedroom to a smaller one, no doubt occupied by the worthy doctor himself during His Majesty's residence. The design displays a curious motto, "Give of of that little (to) my bretheren also," in black letter, with a crown and wings beneath. The first "of" is evidently a mistake for "ye," and the spelling of "bretheren" is original, though not without precedent. The word "to" was unfortunately destroyed by accident while exposing the fresco. There is a rumour of a large blue cross having been discovered some years ago on the west wall, but all traces of it have disappeared. In the small room adjoining, a store of coins was found hidden behind one of the beams of the wall. Even before Borde's time the Old Mint was in existence, and it is believed that coins were struck here during the Roman occupation, and afterwards. The great chimney of the Mint furnace is still standing, though the fireplace itself is bricked up, and the old copper, also used in smelting, has been replaced by a modern one. The ancient pump is to be seen against the north wall, and was in use up to thirty years ago, while a small, filled-up well in the floor on the east side is said to be connected, by an underground passage, with the well in Pevensey Castle.

Behind the big chimney are two small chambers, as yet unexplored, and roomy lofts with concealed entrances, used in

former years by the local smugglers for storing "run goods." The house is built directly on the ground, the floor being only 9 inches above the soil, and the low ceilings and doorways are very quaint and old-fashioned. The oak room was discovered some nine years ago by Mr. Kelsey. An accidental blow on the whitewashed plaster revealed the wood beneath, and immense pains were taken to clean and restore the valuable panelling. The entire room was found to be lined with oak, ornamented here and there with diamond-shaped carvings. Over the fireplace was a fine carved oak overmantel, divided into two, each panel representing a leviathan, with an elaborate heraldic tail, approaching a hook or spear, on a stippled ground. The overmantel is probably 150 years old, but the rest of the woodwork is considerably older, 200 years possibly.

A small room on the ground floor, which can be entered only by going through the house—an important point—has the reputation of being haunted. Quite recently a gentleman who was sleeping there related that he was disturbed in the dead of night by a female form in a white headdress, who peered at him through the diamond-paned window. On his remonstrating with her, she "instantly"—so he described it—appeared at his bedside, having entered through the locked door. He gave up his room in consequence. The Mint House is close to the Old Court of Pevensey, which possesses two cells and a spiked wall, with an iron-studded door abutting on the roadway. A story is told of the trial here of a man who was accused of stealing a pair of leather breeches. The jury found him guilty—of manslaughter. Yet there was wisdom in their foolishness; manslaughter was punishable with imprisonment, while in those bad old days stealing was a capital offence. Pevensey is still officially a "town," though it no longer boasts a "chief magistrate" and "jurats" of its own.

EXHIBITION OF IRISH BUILDING STONES.

THE Department of Agriculture and Technical Instruction for Ireland have taken steps to place on view for a period of three months, at the Imperial Institute, London, the extensive collection of Irish minerals and building stones which formed one of the most interesting and valuable of their exhibits at the recent Exhibition in Cork. The exhibit will embrace samples of the varied and excellent building materials and marbles in which Ireland is particularly rich, and it is expected that the opportunity of examining these samples will be of advantage to those who are concerned in the many large building schemes now in progress in London and elsewhere in Great Britain. The beauty and excellence of the Irish granites, sandstones and limestones, as well as of the red, green and black marble and the other ornamental stones of the country are well known, and when shown at the Department's exhibit at Cork were much admired. The exhibit also includes specimens of clays, cement-making materials and fine sands. In the mineral section of the exhibit are a series of prospectors' samples of the metalliferous deposits of the country and samples of Irish coal and other minerals now being worked.

The Department of Agriculture will take steps to place the fullest information on the subject of this exhibit at the disposal of inquirers. It is intended to open the exhibition about the middle of February.

ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.

A REGULAR meeting of the Council was held at the Institute rooms on Monday, the president, Mr. G. C. Ashlin, in the chair. There were also present:—Mr. J. Rawson Carroll, Sir Thomas Drew, Mr. A. E. Murray, Mr. F. Batchelor, Mr. W. G. Gilliland, Mr. W. J. Fennell, Mr. F. G. Hicks, Mr. C. J. McCarthy, Mr. C. A. Owen, Mr. R. C. Orpen, Mr. W. Mitchell, Mr. G. P. Sheridan, and the honorary secretary, Mr. W. Kaye Parry. A communication was read from the Ulster Society of Architects informing the Institute that they had appointed Mr. Gilliland and Mr. Fennell to act as representatives of the Ulster Society on the Council of the Institute for the present year. The Council received a report from the honorary secretary with reference to the establishment of a qualifying examination for membership. It was decided to have the usual annual exhibition of the prize drawings of the Royal Institute of British Architects. The Council had under consideration the rules of the Master Builders' Association with reference to tendering, and the honorary secretary was instructed to address a communication to that body on the subject.

Mr. R. W. Perks, M.P., in his speech at the meeting of Methodist delegates in the Royal Aquarium on Monday, said that they hoped before very long to erect on that site "a building which, in its beauty, its simplicity, its utility and its permanence would be typical of their great church."

GENERAL.

The British and South African Exhibition at Ca Town will open in November next as arranged. The death of Mr. Baker, the secretary, will cause no alteration.

The Assessor, Mr. Aston Webb, A.R.A., having declined to assent to an extension of the time originally fixed for the delivery of the plans, &c., for the Cape of Good Hope University buildings, the Agent-General states that the original date—namely, January 31—for sending in all such plans, will be adhered to.

The Lancashire County Council offer twenty monetary prizes for the purpose of encouraging technical students to show originality in designs for woven fabrics.

The Delegates of the Common University Fund, Oxford, have appointed Lewis R. Farnell, M.A., and John L. Myres, M.A., lecturers in Classical Archaeology, to hold office for three years from January 1, 1903, and to lecture under the direction of the Lincoln and Merton Professor of Classical Archaeology and Art.

The Surveyors' Institution junior meeting will continue on the 16th inst. the discussion of Mr. Latham's paper "Dilapidations," which was adjourned on the 19th ult. owing to want of time. On Monday, February 9, a paper will be read by Mr. William Woodward (Fellow) entitled "Some of the Difficulties which present themselves to the Architect and Surveyor practising in London."

The St. Petersburg Academy of Fine Arts now admit women as students of architecture and house-building.

Mr. C. W. Green, of the firm of Messrs. Holme & Green, at Liverpool, has been elected president of the National Federation of Building Trade Employers of Great Britain and Ireland.

The Earl of Rosebery has presented to the Hawick Archaeological Society a collection of arms and articles from Somaliland. The articles number between thirty and forty and include sandals, spears, tanned hide, a prayer mat and riding saddle. The Society recently presented Lord Rosebery with an apothecary's bronze mortar of the sixteenth century the property of an ancestor of his.

Sir William Emerson has been nominated by the Lord Mayor as one of the nine members of the committee of inquiry as to the proposed enlargement of St. Bartholomew's Hospital on its present site, or whether any better scheme of rebuilding than that suggested by the Governors can be devised.

The International Exhibition at Athens will be opened on April 7, and will continue for six months. All descriptions of manufactured articles will be admissible.

The "Tablet" states that four ancient Byzantine holy water fonts, from an old church in Treviso, near Venice, have been purchased and presented to the Roman Catholic Cathedral at Westminster. One of them is very large, carved in *rosso di Verona*, with characteristic animals climbing down the outside of the basin; the others are equally curious for their Byzantine artistic decorations.

Mr. Fletcher Moulton, E.C., has made his award in the arbitration between the London County Council and the Great Northern Railway Company. A part of the goods station and stables in the East End was taken for a new approach to the Tower Bridge, and the sum of 230,000*l.* was claimed for the property. It is understood that the amount to be paid has been fixed approximately at 150,000*l.*

The Market Hall, Northwich, demands costly reparations owing to subsidence which prevails in the district. The Council cannot seek compensation, and the Local Government Board are unable to sanction loans for the repair of any building which was erected by means of a loan.

A Meeting is to be held at the Guildhall in order that expression may be given to the opposition of the various wards of the City of London to the London Building Act Amendment Bill which will be introduced into Parliament next session.

Mr. Charles Walter Radclyffe died in Birmingham on Tuesday in his eighty-seventh year. He was a landscape painter, both in water-colours and oils. Mr. Radclyffe was one of the oldest members of the Birmingham Society of Artists.

A Commission has been appointed to take steps to secure the walls of Nuremberg, which are falling into ruin.

The Protection of Children Bill now passing through the German Reichstag provides that children under thirteen years of age must not be employed in building operations, brick-kilns, quarries and mines.

The Annual Exhibition of the Glasgow Institute of Fine Arts opened on Tuesday. Several pictures which were seen at the Royal Academy last season have been contributed, as well as some that were at the last Paris Salon.

Mr. William Ballard Cockrill, architect and surveyor, Gorleston, Great Yarmouth, has been returned as town councillor for St. Andrew's Ward for the county borough of Great Yarmouth.

The Architect, February 6, 1903.

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—April 14—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 5,000l. Premiums of 60l., 25l. and 15l. will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Arrott. Mr. W. T. Baker, town clerk, King Square, Bridgwater.

BRISTOL.—Feb. 9.—The Bristol School Board invite designs for school premises at Moorfields, St. George, Bristol. The competition will be restricted to Bristol architects. Mr. W. Henry Adams, clerk to the School Board, Guildhall.

CASTLEFORD, YORKS.—Mar. 31.—Designs are invited for a free library. Premiums 15l. and 10l. respectively. Mr. H. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

CHEPPING WYCOMBE.—March 4.—Designs are invited for the erection of a town hall and municipal buildings. Premiums of 100 guineas and 25 guineas will be awarded for the designs placed first and second respectively. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, Wycombe.

FENTON.—April 30—Designs are invited for a public free library. Premiums of 60l. and 30l. are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300l., 200l. and 100l. are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

SUNDERLAND.—April 30—Designs are invited for proposed alterations and additions to Victoria Hall, Sunderland. Premiums of 100l., 50l. and 25l. will be awarded for the first, second and third designs respectively. Mr. F. M. Bowey, Town Hall, Sunderland.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000l. Premiums of 50l., 30l. and 20l. respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C.E., borough surveyor, Council House, Sutton Coldfield.

VICTORIA (HONG KONG).—Governor invites designs, accompanied by reports and estimates of the cost of erecting a building to contain the Post Office and other Government offices in this city. The author of the design placed first in order of merit will be engaged as consulting architect for the work, and will be paid a commission of 3½ per cent. on the actual cost of the building, exclusive of any moneys paid in respect of supervision, which will be provided by the Government. A further sum of 1,500 dollars is offered for the design considered second in order of merit. Particulars may be obtained on application at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CONTRACTS OPEN.

BASFORD.—Feb. 6.—For erection of stabling, &c., for thirteen horses at Basford, for the Midland Railway Company. The Secretary of the Way and Works Committee, Midland Railway, Derby.

BATLEY.—Feb. 23.—For erection of new central stores in Commercial Street, Batley. Mr. Harry B. Buckley, architect, 85 Commercial Street, Batley.

DE LAVAL STEAM TURBINES.

WE have received from Messrs. Greenwood & Batley, Ltd., of Albion Works, Leeds, one of their new steam turbine albums. This album is a really artistic production containing a description of the various uses to which the De Laval steam turbine has been applied. It contains some fifty full-page blocks showing examples of works where the De Laval steam turbine is in use. These include many electrical installations for power and light, engineering works, telephone exchanges, saw mills, steam laundries, collieries, chemical works, dockyards, public institutions, steamships and waterworks. Some of the applications of special interest to architects, apart from the generation of electricity, are for driving pumps and other machinery, in sinking of foundations and general power in buildings and civil engineering works, where owing to their high efficiency, portability, small weight (no foundations being necessary) they are very suitable. The De Laval steam turbine may be direct coupled to dynamos, centrifugal pumps, gas exhausters, fans and in fact any high-speed machinery, as well as being suitable for belt or rope driving. Every architect concerned in the application of steam-power for any purpose should, before deciding on the type of plant, obtain from this firm the album in question and general particulars of this steam motor, which has advantages in simplicity, economy of capital cost and working expenses over ordinary (reciprocating) steam-engines for many purposes.

WATER SUPPLY AT A PUBLIC INSTITUTION.

THE importance of having a proper supply of water cannot be over-estimated for a public institution, and it is necessary to have available a large volume of water at a moment's notice in case of fire. There appears to be a considerable difference of opinion as to the supply available in the case of the fire at Colney Hatch asylum. It may be of interest to mention in this connection that in one large institution of a similar nature improvements with the water supply have recently been carried out. Water is stored under a pressure of 60 lbs. per square inch, equal to 130 feet head, the hydrant mains being kept charged and the hoses connected to the hydrants, so that an attendant can at a moment's notice bring a hose into operation to reach a fire at any part of the buildings—even on to the roof of the highest block. This can be effected before the alarm is sounded and the other members of the staff arrive.

The new arrangements are capable of supplying in case of fire 18,000 gallons of water in the first hour and 10,000 gallons continuously. There are two deep wells, thus avoiding the risk of failure of supply during repairs, and another well is now being bored. In addition, the water company's high and low-pressure mains are in the buildings, from which in the event of fire the Fire Brigade could draw on its arrival should by any possible chance the independent service be insufficient. These arrangements have been carried out under the advice of Mr. F. J. Warden-Stevens, A.M.I.M.E., A.M.I.E.E., consulting engineer, of Westminster.

STANLEY HALL, SOUTH NORWOOD.

THE Chancellor of the Exchequer opened on Monday the new hall which has been erected at the expense of Mr. W. F. Stanley, long known as a maker of drawing and scientific instruments, and which is to be presented to the district. In this building Mr. Stanley desired to embody some of the conclusions he arrived at during his long connection with architects, engineers, surveyors and contractors. The professional assistance he sought was limited to what was necessary in the preparation of the plans required by the builders. Solidarity is the characteristic feature of the premises, and the foundations rest upon a bed of concrete 16 feet thick. The hall is entered from a handsome foyer, the walls of which are lined with white marble, while Aberdeen granite, and grey and black marble enter largely into the composition of a magnificent proscenium, the panelling, capitals and other ornamentation of the same being modelled in gilt. There is a parquet floor, and the simple principle adopted in the construction of the roof secures excellent acoustic properties. An art gallery adjoins the assembly-room, and it is the desire of Mr. Stanley that the building shall be vested in a trust for the permanent use of the inhabitants of South Norwood and Croydon, as a centre of education, recreation and entertainment. No conditions of a restrictive character are attached to the gift, and Mr. Stanley's only object in wishing to be personally associated with the administrative body is that he may have the opportunity of perfecting the equipment of the building for all the purposes to which it will hereafter be devoted.

Mr. Ritchie testified to the munificence and public spirit of Mr. Stanley. He said that there had been a large expenditure

anyone who looked at the beautiful building could readily see. Though expenditure was not necessarily judicious because it was large, everyone who saw those premises must come to the conclusion that in this case expenditure had been not only large but judicious; and that not only had a building been erected which was a proper building for the purposes in view, but a building that would long remain a great ornament to the neighbourhood. It had great artistic merit, and that merit was not due to any professional aid which Mr. Stanley had brought in to help him with the task he had undertaken. The artistic merit was due entirely to himself. Having determined to find the money, he determined to find the design; and he congratulated Mr. Stanley on the handsome building which he had produced. It was right and proper that for all time it should be known as the Stanley Hall, and that the busts on the façade should include one of the generous founder. But something would be wanting if the building were to be confined to educational, scientific and literary pursuits; and he was, therefore, glad to know that it would provide also for amusement and entertainment. He was pleased, however, to learn that nothing political was to be associated with the hall; and the busts of Gladstone and Disraeli were added to those of Darwin, Dickens, Tennyson and Faraday, because they were great Prime Ministers and great men, who for many years presided over the affairs of this country, and served the people faithfully and well. In the hope that it might help many in the path of duty—which was the only path to happiness—he had great pleasure in declaring the Stanley Hall open. Mr. Ritchie concluded by expressing his thanks to Mr. and Mrs. Stanley for a gold key which they had presented to him as a memento of the occasion.

ST. PETER'S new Roman Catholic church, Partick, was opened on Sunday last by Archbishop Maguire. The new church and presbytery are situated on the east side of Hyndland Street and south side of Wood Street, Partick. The church is designed in the early style, the nave, which is 104 feet long, consists of seven bays, and the chancel is divided from the nave by a chancel arch 34 feet long, making the total length of the church 138 feet. The presbytery has been built to accommodate five priests. Red sandstone has been used throughout the buildings, which were designed by Messrs. Pugin & Pugin, London.

NEW CATALOGUE.

THE handsome new catalogue issued by the Electrical Power Storage Company, Ltd., contains, in addition to a mere description of goods and list of prices, a considerable amount of information likely to be valuable to electrical engineers, &c. As regards the catalogue proper, we note that the "K." type has been removed from the list; the company can still supply "K." type sections for renewals, but the "W.S." type has now taken its place, being a more durable type and consequently less expensive to maintain. Diagrams showing sizes of "L," "W.S.," "P." and "O.K." will also be found. The "O.K." type is a new type which gives approximately double the discharge rate and capacity while occupying the same floor space as their "P." type. The "Carzonode" type is manufactured with a new type of negative, and is specially designed for low maintenance rates. The ship lighting "W.T." type, which the company have been gradually improving during the past two years, is now listed, and will be found to contain all the latest improvements in cells suitable for this class of work.

VARIETIES.

ST. CUTHBERT'S Roman Catholic school, Slateford Road, Edinburgh, has been formally opened.

MR. W. K. VANDERBILT'S mansion, "Idle Hour," at Oakdale, is said to be in danger of complete destruction. The foundations were built on sand and are now settling, with the result that the walls are cracking.

A NEW Wesleyan chapel was opened at Broughton Moor on the 28th ult. It has been built in the Gothic style of architecture from plans prepared by Mr. Scott, architect, Workington, to accommodate from 150 to 200 worshippers, the contract price being 720*l.*, which, however, it is expected will be slightly exceeded.

ON the 31st ult. a new church was dedicated and opened in Upper Kennington Lane, Kennington, for the Roman Catholic population of the Vauxhall and Kennington districts. The new building is Gothic, and it provides seating accommodation for a congregation of 700. The cost has already reached 10,000*l.*, but with further embellishments in prospect more will be required. The church is dedicated to St. Anne.

THE South-Eastern Railway Company having agreed to guarantee the interest on Dover Harbour Board's new loan of 1,070,000*l.* for a mail packet marine station and further harbour development, Messrs. Pearson, contractors for the National Harbour, have commenced surveys and soundings in connection with the work.

THE erection of hospitals at Pietersburg, Lydenburg, Boksburg, Middelburg and Standerton will be commenced as soon as the plans and estimates, &c., can be prepared. The cost of the buildings and the maintenance will be provided from Government funds. The charge for the use of single-bedded wards for white patients will be 15*s.* a day, and for ordinary wards 10*s.* a day, exclusive of medical attendance. Government servants will be admitted at reduced rates in proportion to the amount of their salary.

A NOTABLE addition to the interior furnishing of Scarisbrick Hall, the residence of the Marquis de Custegn, is about to be made in the shape of a carved oaken doorway for the nursery. Carved oak is indeed one of the features of Scarisbrick Hall, every nook and corner affording choice examples of old-world carving. The doorway now to be fixed connects the main landing of the hall with the new nurseries for Count Andre de Custegn. The doorway, which is probably 400 years old, shows a complete series of the incidents in the Book of Esther, and is a most marvellous piece of carving. Over the door is an inscription in Gothic text lettering:—"Love God; honour your parents." The large, massive cove which goes around the doorway is filled in with a stem of roses, boldly carved. The spandrels over the Gothic arches had been formed of oak leaves very deeply carved, and a shield with the Custegn crest on one side, and the Scarisbrick crest (a dove) on the other.

ELECTRIC NOTES.

THE umpire appointed to assess the value of the Metropolitan Electric Supply Company's undertaking in the borough of St. Marylebone, which is to be acquired by that borough, has awarded the sum of 1,212,000*l.* as the price to be paid to the company.

MR. PERCY BOULNOIS, C.E., Local Government Board inspector, has held an inquiry at Lancaster into an application by the Corporation to borrow 25,000*l.* for electric-light purposes, in addition to the 10,000*l.* authorised by the Parliamentary Bill of 1900. Mr. Heald, chairman of the electricity committee, said the application was necessitated by the constantly growing demand for electricity both for lighting and motor purposes, especially in the outer districts.

BUILDING AND BUILDERS.

AT Matlock Bath, certain additional waterworks, including a pumping station, have been agreed upon, the whole cost being estimated at 2,300*l.*, and a Local Government Board inquiry has been held thereon.

A GREAT outlay has been sanctioned by the Government for the building of houses on the Rand suitable to the means of employes and officials. The Government is spending 1,000,000*l.* and has stipulated that in no case shall the rent charged exceed one-sixth of the employee's salary.

THE Wesleyans of Barrow have decided to embark on a great extension scheme which comprises the building of a mission hall in the Hindpool portion of the town to seat 1,200 people, a permanent church in Greengate to seat 400, and a new church at Vickerstown, Walney Island, the cost of the three-fold scheme being about 10,000*l.*

PLANS are being prepared for a new church in the conventional district of St. John's, Hopwood, near Bury. The cost of the church is estimated at 5,500*l.* and the accommodation will be for 500 persons. The new building will take the place of an iron church which has been in use upwards of twenty years.

THE Examiner of Standing Orders in the House of Commons found the standing orders had been complied with by the promoters of the Bury and District Water Board Bill, which authorises the Board to spend 255,000*l.* on extensions. There are to be three new reservoirs at Scout Moor, and these are to

be known as the Scout Moor reservoir, the Scout Moor High-level reservoir and the Newhall reservoir.

THE Evesham Guardians have recently erected a new infirmary, and at the last meeting they passed resolutions consenting to the expenditure of a sum not exceeding 788*l.* in connection with that work, in addition to the sum of 5,500*l.* which had been previously authorised; also to the erection of casual wards at a cost of 3,750*l.*, the reconstruction of the clerk's offices at a cost of 850*l.*, and the expenditure of 317*l.* for lighting the new and old infirmaries. Six tenders for the building of the vagrant wards and offices were received, and the tender of Messrs. Espley & Co., of Evesham (3,774*l.*), was accepted.

THE Bishop of Nottingham, Dr. Brindle, D.S.O., laid the foundation-stone of the new classrooms being erected in connection with St. Patrick's schools, London Road, Nottingham, on the 29th ult. The additional rooms in course of construction on a site adjoining the existing building will provide accommodation for seventy infants, sixty-five boys and an equal number of girls. A separate entrance with a stone staircase leading from Leen Side is included in the scheme, and a small playground and communication with the present schools have been arranged for. The style to be adopted is similar to that which characterises the existing schools, and the estimated cost of the new room is about 2,000*l.* Messrs. Evans & Sons are the architects.

THE Lancaster Board of Guardians have instructed the buildings and properties committee to consider a scheme for extending the vagrant accommodation at the workhouse. It was pointed out that while there is accommodation for 59 vagrants, the average at week-ends for the past year was 70, and on one occasion there were as many as 105. Many came in on Saturday nights ostensibly to secure a bath and a clean bed, and there is reason to believe they appoint a banker outside. Some of the Guardians argued in favour of temporary provision under the impression that when the Heysham Harbour and Manchester Thirlmere Aqueduct are completed less men of the class will frequent the neighbourhood. On the other hand it was urged that, having regard to Lancaster's geographical position, they would always have tramps with them. Lancaster, it was stated, had the largest number of casuals in the country because, owing to lack of accommodation, they escaped tasks. That it was now proposed to remedy.

THE Vicar of Wednesbury (Rev. T. W. Wilkes) has received an offer from a donor, who desires to remain anonymous, to bear the cost of erecting a south transept as an addition to the structure of the parish church, a step which it is estimated involves an expenditure of from 1,300*l.* to 1,500*l.* For some time past the mother church of the town has been undergoing alteration and renovation, and during the past twenty years a sum of about 10,000*l.* has been spent on a restoration scheme. A north transept was quite recently built, with the result that a great improvement in the appearance of the church was effected. The completion of the scheme involves the erection not only of a south transept, but also of a north side and clerestory, the total cost being estimated at about 2,500*l.* Much gratification is felt that the munificent offer now received will enable an addition to be made which will greatly enhance the noble proportions of the present buildings, and will also considerably increase the accommodation.

MR. JOHN LANE, general secretary of the Cardiff Painters and Decorators' Union, has given the masters notice of the following fresh demands:—Wages to be 9*d.* per hour (the present rate is 8*d.*); all holidays to be counted as double time (Sundays and Christmas Days only are now so counted); the percentage for overtime between 5 P.M. and 7 P.M. to be at the rate of 2½ hours, and 6*d.* for ordinary days and 1*s.* for Sundays as country money. There are about 400 painters and decorators in Cardiff, but not more than 200 are society men. They appear to be determined to secure the concessions specified, and the masters are said to be equally determined to refuse them. One well-known employer says that the present condition of the trade does not justify the attitude taken up by the men. "Their demands," he said, "are unreasonable, and, if persisted in, a strike is inevitable. They should have waited until next year, when the trade will most probably revive. The hours are fifty-six a week, and between March and September many men earn an average weekly wage of 2*l.* If they would buy their own kit the masters would, I believe, grant them what they now ask, but not otherwise."

THE foundation-stone of the new church in course of erection in Newtown district, Malvern Link, as a memorial of the late Archdeacon Livingstone, who was well known in Malvern, who died in May last, has been laid. It will be known as the Church of the Ascension, being built to plans prepared by Mr. W. J. Tapper, of Gray's Inn, and will consist of nave

and choir, capable of accommodating a congregation of about 400. The dimensions of the nave are 27 feet by 65 feet and 35 feet high. It is to contain four bays, formed by stone arches springing from stone shafts attached to the north and south walls. There are no side aisles; but a stone arcade, built in the walls at either side at a height of some 13 feet from the floor, will form a triforium at that level. At the west end a small tower is to be built, containing a baptistery, organ-chamber and a belfry in its three successive stages. Externally, on the western side of the church, will be a sculptural representation of "The Ascension." The dimensions of the choir are 18 feet wide, by 36 feet long and 36 feet high, and will contain three bays in its length, vaulted with stone and plaster. The choir will have a similar triforium to the nave. The latter will have coupled lancet windows in each bay and the choir single lancets, with a triple-light east window. The natural fall of the ground eastwards makes it convenient for placing the vestries under the choir. Guiting stone is to be used for the designs externally and Farleigh Down internally, the plain surfaces being of brick, plastered. The roofs are to be covered with stone slates. The material used in the construction of the church has been specified to be the best obtainable. Messrs. Stephens, Bastow & Co., of Bristol, are the builders.

AUTOMATIC SPRINKLERS.

THE following letter from Messrs. Mather & Platt, Ltd., has appeared in the *Times*:—

In view of the terrible fire which occurred yesterday at the Colney Hatch lunatic asylum, by which fifty-two lives were lost, we beg leave, through your columns, to bring before the notice of the public the question of automatic protection against fire. Had the annexe of this asylum which was destroyed been fitted with an installation of automatic sprinklers, we firmly believe that those fifty-two lives would have been saved, and the fire extinguished in its incipency by the operation of the nearest sprinkler. We read that the fire appliances available at the asylum were undoubtedly brought into operation quickly, but the fire brigade were unable to save the building. With sprinklers no human agency is required to set them in operation, the fire itself being made the agency of its own extinction.

At the inquest on the unfortunate victims of the fire which recently occurred at the Vernon Cotton Spinning Company's

CABOT'S INSULATING & DEAFENING QUILT.

A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does so. Send for Special Book on Schoolhouse Acoustics, illustrated.

A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay, moth, and vermin-proof, and unflammable.

FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

mill, Stockport, the jury recommended that sprinklers should be installed in all "fireproof" cotton mills. Surely, if it is considered expedient to protect buildings constructed of concrete and iron, it is even more necessary for premises such as the annexe burnt down at the Colney Hatch asylum (built with corrugated iron, with matchboard sides) to be provided with sprinkler installations.

We make no apology for writing our views on the question of fire protection, as we venture to think that the subject is one of national importance. We wish to emphasise the fact that long ago automatic sprinklers passed out of their experimental stage, and there is no question whatever as to their efficiency and certainty in extinguishing fires. Not only this, but they will accomplish the work with a minimum amount of fire and water damage. They have proved their worth in fire after fire, in all classes of manufacturing risk, and we submit that they are the one and only practical appliance for the thorough protection of public buildings, and especially those where a large number of human lives are in jeopardy.

INSTITUTION OF CIVIL ENGINEERS.

THE fourth meeting of the session of the Glasgow Association of Students was held in the rooms 207 Bath Street, Glasgow, on Monday evening, the president (Mr. C. C. Lindsay, M.Inst.C.E.), in the chair, when Mr. Arthur A. W. Wynne, M.A., Assoc.M.Inst.C.E., read a paper, illustrated by lime-light views, on "Steam Turbine Machinery." After a few introductory remarks, Mr. Wynne mentioned the best-known makes, and described their leading features. Short historical notes followed, showing the development of the Parsons turbine, which is by far the most widely used at the present day. In discussing the science of this engine, the effect of vacuum, superheat and boiler pressure were considered and brought out clearly by the help of curves. Some details of construction were well illustrated by a wall diagram of a 600 horse-power plant. A comparison between the turbine and reciprocating engine followed, in which the striking differences between them were well brought out. The machinery that is driven by the Parsons engine was next described, and included dynamos, fans, pumps, blowers, air-compressors, and, lastly, the propelling machinery for ships, the latter being treated fully, and the results from turbine steamers noted. The important subject of

steam consumption claimed special notice, and in the case of this class of engine was shown to be good. Some account of the running of these machines in everyday work was given and the cost of an installation of turbine engines discussed. An interesting discussion followed, and, on the motion of the Chairman, a hearty vote of thanks was awarded to Mr. Wynne.

SURVEYING BY PHOTOGRAPHY.

THE fortnightly meeting of the Manchester Literary and Philosophical Society was held on Tuesday evening at the Society's house, 36 George Street, Manchester, Mr. Charles Bailey, president, in the chair. Mr. L. G. Radcliffe and Professor Edmund Knecht, of the Manchester Municipal School of Technology, were elected ordinary members. Mr. C. E. Stromeyer read a paper on "Parallax Determinations by Photography," in which he dealt with the advantages photography offers for rapid and accurate surveys. The principle recommended was to superimpose the image of a photographic negative taken at one position on the image of a photographic positive taken at another position, the parallax, or angle which separates two positions as seen from any of the object in the photographs, being measured micrometrically by shifting one of the images until the object registers and disappears. It was suggested that the best result would be obtained by placing the two photographs in two lanterns and superimposing the images on a screen or into a microscope eyepiece, but the instrument shown was arranged to suit a single lantern, the negative and positive being placed film to film. One of the pairs of slides was a man's face, the eyes, beard and other parts alternately disappearing as the one plate was slid over the other. Another pair showed a landscape at Whitby, from which the distance of various objects could be measured by making them disappear; then followed a pair of stellar photographs, which were of interest as showing how easily the position of even a hazy object, like a comet, can be determined, and the measurements were made of the path of an electric spark. Some practical advice followed as to the best method of preparing the transparencies so as to make them truly complementary to the negatives. Mr. W. B. Baron read a paper on "The Influence of Hydrogen in Fuel in the Composition of Flue Gases."

referred to the loss sustained by the Society and by the scientific world in general through the death of Sir George Stokes, an honorary member of the Society and the first recipient of the Wilde Medal.

COST OF LONDON BOARD SCHOOLS.

A STATEMENT was presented by Sir Charles Elliott at last week's meeting of the London School Board relating to the loan to be raised during the next financial year. He said it was the same amount as they had fixed on for borrowing during each of the last ten years, with slight variations. Three years ago they agreed to borrow 700,000*l.*, but as a matter of fact they only raised 550,000*l.*, and in 1898 and 1899 they fixed the figure at 550,000*l.* There had therefore been very little change in the amount spent on school building for ten years, and the anticipation which had sometimes been formulated, that as the child population of London had ceased to increase the indebtedness of the School Board on account of new schools would also stop growing, had proved to be fallacious. On the contrary, the Works Department was probably as full of work now as it ever had been. While the number of contracts given out during the last year, 1902, was nearly as large as in its predecessors since 1894, the number of schemes for building, which would shortly involve the giving out of contracts and the raising of loans, was larger than it ever was in the decennial period, having reached the high figure of seventy-six. There was therefore obviously no prospect of any contraction of their building operations for the present. On the other hand it might be noted that while the weight of their debt increased at the rate of about 600,000*l.* a year, the rate at which they were paying it off increased, and had now nearly reached the figure of 300,000*l.*, or about 1*1*/₂% in the pound. The subject to which he wished to draw special attention on the present occasion was the rise in the estimated cost per child. This was in 1894 15%, in 1895 18%, in 1896-99 20%, in 1900 25%, in 1901 and 1902 28% and in 1903 30%. For the year 1904 it was estimated at 26%. This figure, which was more commonly called the cost per "place," had risen steadily and heavily, and it was now double the sum at which it stood in 1894, though they anticipated a slight decrease in the coming year. This increase had often been made a ground for severe animadversion on the apparent extravagance of the London School Board, and some remarks of this nature which fell from the chairman of the Croydon School Board last autumn had

lately been the subject of an inquiry by a special sub-committee of the works committee. The statistic was one of some importance, for it was commonly used to indicate the cost of building. For instance, in the recent Parliamentary debates, when it was sought to estimate the value of the buildings which the managers of voluntary schools were giving up to the nation, the ordinary method used was to multiply the number of children in these schools by an assumed average cost per "place." It was, therefore, worth while to examine carefully how this statistic was usually worked out, and how it ought to be worked out if it was to be used as a comparative test of the cost of construction. The figures which he had quoted had hitherto been obtained by taking the total amount of the contracts given out two years before, on the assumption that the major part of the expenditure would be incurred two years after, and dividing them by the total number of children for whom accommodation was being provided. But it must not be supposed that the whole of this cost was incurred in providing this accommodation. Part of it was spent on drainage, playgrounds, boundary walls and schoolkeepers' houses; part in centres for manual training, cookery, &c., and the remainder on the school buildings which contained the "places" for the children. All the buildings, however, were not given up to the provision of school places. Besides the classrooms and the halls their schools contained art-rooms and science-rooms, which might accommodate more children if the space were not devoted to these special purposes. In dealing with the cost of building they had not to consider how the space was allocated, but only how much space was provided. And as it was laid down that every child in senior departments required 10 square feet in the classroom and 4 square feet in the hall, he proposed to treat 14 square feet as the equivalent of a "place," and to divide the total expenditure on the school building alone, apart from the accessories mentioned above, by the number of "places" thus defined, in order to calculate the cost of a "place." It was only when treated in such a way that this statistic could be used to compare the cost per place of one year with another, or that of one school or one place with another. Thus, in the year 1901 contracts were given for 15 new schools and enlargements, amounting to 219,968*l.*; and as these schools were to provide accommodation for 7,997 children, the cost per child, including 10 per cent. for furniture and expenses of architect's department, was set down as 30*l.* But the expenditure of 219,968*l.* included, besides 153,218*l.* for school buildings, 7,032*l.* for centres and 59,718*l.* for drainage, playgrounds, &c.; and

though room in classrooms and halls for only 7,997 children was arranged for, the art and science-rooms and gymnasias contained additional space for 1,340 children more, or 9,337 in all. Using the number of children thus modified to divide the cost of the building, 153,218*l.*, they found the corrected cost "per place" to be 16*l.* 8*s.* 2*d.*, instead of 30*l.* He had not attempted to revise the whole set of figures on this basis, but, taking those for the first year of the period 1894, he found that the corrected cost per "place" was 11*l.* 8*s.*, and that, while it rose to 16*l.* 8*s.* 2*d.* in 1901, it fell to 14*l.* 15*s.* 1*d.* in 1902. What the explanation of this decrease in the year ending with Lady Day 1902 was, the report of the works committee for that year did not disclose. The figures for individual schools showed that even in 1901 it was possible to construct a school at the rate of 13*l.* 14*s.* per "place," and in 1902 a contract was given for a school building at the rate of 12*l.* 14*s.* 8*d.* As long as rates of this kind were adhered to the London School Board could not be accused of building at an excessive cost in comparison with the expenditure incurred in the adjacent districts. On the other hand, even in 1902 there were schools the contracts for which ran as high as 17*l.* and 17*l.* 10*s.* He was sanguine enough to hope that some day a reforming economist would arise in the works committee, or in what would in future take the place of their present works committee, who would take note of such large differences as these in the expenditure, and would compel the Department either to justify the higher rates or cut them down.

SOCIETY OF ENGINEERS.

THE first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 2, at the Royal United Service Institution, Whitehall. Mr. Percy Griffith, the president for 1902, first occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's gold medal to Mr. Thomas Andrews, F.R.S., for his paper on "The Effect of Segregation on the Strength of Steel Rails;" the Bessemer premium of books to Mr. Augustus R. Galbraith for his paper on "The Hennebique System of Ferro-concrete Construction;" a Society's premium of books to Mr. Benjamin H. Thwaite for his paper on "British *versus* American Patent Law Practice and Engineering Invention," and a Society's premium of books to Mr. Brierley D. Healey for his paper on "Recent Blast Furnace Practice"

Mr. Griffith then introduced the president for the present year, Mr. J. Patten Barber, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year. The President then proceeded to deliver his inaugural address.

After thanking the members for having elected him to presidency, he congratulated them on the membership being 523, the highest number the Society had ever had. In dealing with some of the works which concerned an engineer holding a municipal appointment, he stated they were so numerous that it would only be possible to refer to a few which were of general interest. On the subject of roads, in which the public interest had been revived since cycling became common, it was stated that great improvements had been made in their condition since the establishment of county councils and the maintenance had been under the control of qualified engineers. The use of suitable stone, broken to proper sizes, steam rolling and more judicious application of binding material, had largely contributed to the improved state of the main roads. It was possible to fix the stones on a macadam road by the method advocated by critics of making them "unite by their angles:" even in McAdam's time the fixing of the stones was accomplished by the small particles ground off the loose stones by the traffic. The addition of suitable binding material was necessary even when a steam roller was used for consolidating the new coat of stone with which a macadam road was repaired. Tar macadam formed a cleaner and smoother surface than ordinary macadam, but was more slippery and not suitable for very heavy traffic; it made an ideal road for cyclists and motorists, but its great cost made the formation of a track along the roads improbable. The use of the scarifier breaking up the surface of macadam roads prior to repair enabled them to be done more effectually and at about one-third of the cost of hand picking.

For paving town roads of very heavy traffic granite, asphalt and wood were used, but the former were frequently objected to on account of being noisy, and the second because of its slipperiness; wood being the material most favoured by the public. Jarrah wood, from Australia, was chiefly used for wood-paving, although there were other hard woods equally suitable, but they were not obtainable in quantities. The supply of other woods was a subject deserving the attention of the colonial Governments, but at the same time the plan-

trees should be carried on in order to make the timber industry an enduring trade.

For the cleansing of roads the horse-scraper and the chine-broom were of great service, and a machine was needed which would sweep mud or dust from a road and transfer it to a vehicle for removal, so as to save the labour and time occupied in forming it into heaps and loading into carts by manual work. The prevention of dust from the roads on the busy streets of a populous town was absolutely essential, the fine particles of refuse and debris from the pavements being very offensive and injurious. Specially constructed vans which would spread water, to which a disinfectant had been added, in a fine spray on the road surface might be tried; and perhaps a machine which would take up the dust from the road by exhaustion, and discharge it into a receptacle containing water, might at some time be invented. Pavements which added to the noise produced by traffic were necessary in the principal streets where business was carried on, and although noiseless shoe for horses did not seem to be practicable, improvements should be made in the construction of vehicles so as to diminish the clatter made by them.

Referring to the disposal of house refuse by means of incinerators, the President remarked that great improvements had been made which had resulted in more perfect combustion of the refuse and the gases from the cells, and that no nuisance was caused in the neighbourhood of properly designed installations. From the clinker paving, bricks and other articles were made by hand or by hydraulic machinery. It was desirable that the dust which filled the air in the incinerator building during the clinkering of the cells should be prevented. From the burning of house refuse steam was raised and used for pumping and other useful purposes.

The improvements in motor vehicles for the haulage of heavy loads were stated to have been the result of the trials which had been made and of the perseverance and enterprise of the makers. But the tare weight of three tons had been found too low for enabling a motor vehicle on four wheels to haul a water load than four tons at a speed of five miles per hour, and the necessity for a tare of four tons being allowed had been indicated by the judges in the Liverpool trials. The practicability of trials being carried out for determining the relative effect of motor and horse vehicles on roads, the most suitable forms of wheels and tyres and other questions connected with the subject of motor traction was pointed out.

Dealing with tramways, the various methods of traction

were mentioned, cable or electric being the only systems likely to be adopted by the authorities in this country. The overhead trolley was chiefly used, although the cable system was not obsolete. In the crowded streets of some large towns the conduit was being selected. Surface contact was a system recently introduced at Wolverhampton. More substantial construction was required for electric tramways than for those worked by horses, and special attention was needed in order to prevent the springing of the rails. An appeal was made for accurate work and attention to every detail of construction.

Speaking of sewerage, the President observed that increased knowledge of hydraulics and the manufacture of more suitable materials had enabled engineers to construct better sewers than those of fifty years ago. The carrying away of storm water was a serious problem in rapidly extending towns, and sufficient provision had not been made for dealing with rainfall in earlier schemes of sewerage. The results of many experiments and the actual working of various systems for dealing with sewage had shown the efficacy of bacterial processes for purifying crude sewage.

The address was listened to with marked attention by a large and appreciative audience, and at its close a hearty vote of thanks was accorded to the President.

THE HOUSING QUESTION IN EDINBURGH.

A LECTURE was lately given in the Building Trades Exchange, Ltd., by Mr. James Moscrip, architect, on the housing question in large cities. After reviewing the present state of affairs and enumerating the causes which attracted people to large centres of population, he said that the question had been brought to the front mainly by the wretched condition of the very lowest class of the community. In this connection he noted that it was not always the poorest who inhabited slum areas. He had in his own experience in Edinburgh found families with a combined income of from 2*l.* to 5*l.* per week living under the most wretched conditions in the centre of slums. There were, of course, many others who were really poor, but who yet managed to keep a comparatively comfortable and clean house. The poor might be divided into the thrifty and the very unthrifty, not to call them by a worse name. There was a class of people whom it was almost impossible to house satisfactorily. It had been said, put a pig into a drawing-room and it remained a pig still and would spoil the drawing-room. Some people, if placed amid good surround-

ings would not keep them in a good condition for more than a week or two. In these circumstances they ought to have some sympathy with the Corporation of Edinburgh in putting up houses which some ratepayers had condemned as byres; he alluded to the so-called model tenements, where the inside work was a disgrace. It was probable that the Corporation had in view the class of people whom they had unhoused, and whom they were compelled to house again, and who were not fit to live in properly equipped dwelling-houses. Discussing the remedy for the problem, he said he did not believe in the taxation of land values; he did not believe in taxing any commodity which was an absolute necessity for the community. Facilities for travelling to the areas outside of the city were all very good, but if such facilities were given the result would be to raise the price of the land in such areas. Henry George's ideas did not find general acceptance in this country, because they did not include compensation to the owners of the land. Mr. Moscrip's suggestion was not to nationalise the land, but to municipalise it. He would have the municipal authorities, as opportunity occurred, acquire land in the outlying districts, paying for it not the owners' price, but the fair market value based on the rental at the time of purchase. The Corporation, becoming thus the superiors, would be able to feu the land to builders at reasonable rates. One result of that system would be that the streets in those areas could be properly laid out in squares, crescents and terraces, as had been done in the new town of Edinburgh. The beautiful arrangement of the streets in the new town of Edinburgh was due to the foresight of George Heriot and his governors who, after George Heriot's death, acquired a huge area on which the new town was built.

The Chairman said he would like the municipal authorities who built houses to show exactly how much they cost per cubic foot. Mr. Paterson said the Heriot Trust had been referred to. That Trust took the highest price for their ground they could get, just as other people did. With regard to the housing of the poor, he thought they did too much for loafers. The more they encouraged the loafing, dirty, lazy class, the more they would encourage pauperism. Mr. Drysdale said that the Heriot Trust were the greatest sinners in regard to the laying out of narrow streets and high buildings, and he quoted Albert Street as an example. He did not know that they could hope to elevate a man by putting him into a bare, ugly dwelling. They need not give him a very fine place, but they might, at least, give a 9-foot ceiling, plenty of floor space and decent walls. As to house farming, the

municipalities were themselves the chief sinners, as they farm out their houses. Mr. Patrick Knox said he agreed with Balfour Waterston that there need be no such thing as a poor man in the city if the people behaved themselves. If man or woman took advantage of the opportunities within their reach, there would be no question of the housing of the poor to deal with. If men and women so far forgot themselves that they could not keep themselves clean, and behaved more like beasts than human beings, then brick walls were quite good enough for them. He questioned whether it was that the community should be taxed to provide houses for such people. Mr. Neil M'Leod thought the Corporation might do very much better than they were doing in housing the class of people whom they had unhoused. They were putting up houses for a class of people who could afford to pay for good houses—people such as masons and joiners, and the community had to pay the difference between what the houses cost and the amount drawn from them.

Mr. Moscrip explained that his address was not intended to deal specially with the housing of the poor, but with the housing problem generally.

THE ASSUAN RESERVOIR.

At the ordinary meeting of the Institution of Civil Engineers on the 27th ult., Mr. J. Clarke Hawkshaw, M.A., president of the chair, the papers read were "The Nile Reservoir, Assuan," by M. Fitzmaurice, C.M.G., B.A.I., M.Inst.C.E., and "Sluices and Lock-Gates of the Nile Reservoir, Assuan," by F. W. Stokes, M.Inst.C.E.

The first paper began with an account of the river Nile and the author stated that, with the exception of the north margin of the Delta along the coast of the Mediterranean, Egypt was a country practically without rain and absolutely dependent on the Nile for its water-supply. The volume of water in the river during the winter months was much larger than was required for the needs of the country, and during summer months the supply was not nearly sufficient. It was therefore not surprising that the construction of a reservoir which should enable part of the surplus winter water to be stored for use during the summer months had been under consideration in Egypt for many years.

The discharge of the Nile fell to about 400 cubic metres (14,000 cubic feet) per second during the summer, and was

minimum about the middle of May. A slow increase in the discharge then began and continued until the middle of July, after which date the increase became very rapid. By the first week in September the Nile was in full flood, and in an average year the discharge was then about 10,000 cubic metres (53,000 cubic feet) per second, while in a year of very high flood the discharge might rise to 14,000 cubic metres (94,000 cubic feet) per second.

The above dates referred to the Nile at Assuan, which town is about 1,200 kilometres (750 miles) from the Mediterranean. The Nile as it entered Egypt proper at Assuan was the product of three rivers—the White Nile coming from the west of Central Africa, and the Blue Nile and the Atbara coming from the Abyssinian Mountains. The two latter rivers when in flood brought down large quantities of valuable fertilising mud or silt, which was made great use of in the method of irrigation, called in Egypt basin irrigation.

In the construction of any reservoir in the valley of the Nile precautions were necessary to prevent the silting up of any reservoir which might be formed.

At Assuan a masonry dam 2,000 metres (2,185 yards) long and of a maximum height of 39·5 metres (130 feet) had been built across the valley of the Nile, thus forming a huge reservoir extending southward from the dam 225 kilometres (140 miles) into Nubia.

No attempt was made to store water while the Nile was in full flood, when its waters were carrying large quantities of silt. Sufficient sluices were provided in the dam to allow the Nile to pass through when in flood without any appreciable diminution in its velocity, and consequently without causing any deposit of silt in the reservoir. No water was allowed to flow over the dam as the sluice-way was sufficient for all purposes. After the muddy flood had passed and the water had become clear, at which time the discharge of the river had fallen to about 2,500 cubic metres (88,000 cubic feet) per second, the filling of the reservoir was begun by gradually closing some of the sluice-gates. The water then continued to rise in the reservoir until it attained a height of 8 metres (26 feet) above high-Nile level, or 16 metres (52 feet) above low-Nile level. In an average year this happened towards the end of February, and after that time the water reaching the reservoir from the south was passed on through the partially opened sluices. Early in May the sluices were gradually opened, and the normal discharge of the river was increased until the reservoir was emptied early in July. This additional

water in summer would enable a much larger number of crops to be obtained, and would be specially valuable for the cotton crop.

The greatest head of water on the dam would be about 20 metres (65 feet), and the storage capacity of the reservoir was estimated at 1,665 million cubic metres (37,612 million cubic feet).

There were 180 sluices in the dam, of which 140 were 7 metres (23 feet) high by 2 metres (6½ feet) wide, and forty were 3½ metres (11½ feet) high by 2 metres (6½ feet) wide. They were fixed at different levels in the dam, so as to allow the discharge of the water according to the varying levels of the reservoir. Those sluices which had to be worked under a great head of water were fitted with Stoney roller gates, while those working under a small head had ordinary sliding gates. The majority of the sluices were lined with granite ashlar, but owing to the comparatively short season available for building, some had been lined with cast iron, to save time. A hand-winch was fixed over each sluice on the top of the dam, to lift and lower the gates. The dam crossed the Valley of the Nile at the head of the Assuan or First Cataract, and the rock at this point was granite. The dam was built of granite in cement mortar, and all the stone had been obtained within a short distance of the works. Both faces of the dam were built of coursed squared rock-faced granite, the up-stream face being laid in 2-to-1 cement mortar, and the down-stream face in 4-to-1 mortar. All these stones had been laid by steam cranes. The hearting consisted of granite rubble and had been laid by hand and set in 4-to-1 mortar. The bottom 2 feet of rubble had, however, been built in 2-to-1 mortar. A good supply of excellent granite sand had been obtained within a reasonable distance. The average actual weight of the masonry was 2,396 kilogrammes per cubic metre (149·5 lbs. per cubic foot), and the maximum pressure on the masonry with the reservoir full was 4·35 kilogrammes per square centimetre (4 tons per square foot).

All masonry had been built in the dry, and to enable this to be done the river had been dealt with in short lengths, and temporary dams (called in Egypt "sudds") had been built to enclose the site of each portion of the work. These sudds had either been of stone or of sand in bags. It had been expected that considerable difficulty would be experienced in dealing with the leakage through the sudds, and very large pumping plant had been provided; but the amount of leakage had been found to be much less than anticipated. The sudds had only

been made high enough to deal with the work during the time of low Nile, as it would have been impossible to make them strong enough to withstand the Nile in flood.

Great and unexpected difficulties had been encountered in the deep channels, owing to finding the granite quite rotten for a long way below the level of solid rock shown on the contract drawings. In one of the channels the rotten rock had extended 11½ metres (38 feet) below where it had been supposed sound rock would be found. As the non-completion of the masonry between the sumps in each section would have necessitated the remaking of the sumps in the following season, great efforts had had to be made to deal with the unexpectedly increased quantities of excavation and masonry before the arrival of the Nile flood. This had been particularly the case during the months of June, July and August 1900. During the month of June work had been carried on night and day, week-days and Sundays, and 45,000 cubic metres (58,860 cubic yards) of masonry had been built during the thirty days. The average daily number of masons employed during the month had been 353. The total number of men either directly employed or connected with the work, and living on the site of the works at that time, had not fallen far short of 15,000. During the four years which it had taken to build the dam, the great pressure of work had always occurred between April and the end of July. This was the hottest time of the year. The mean shade temperature during the day was about 108 degrees Fahr., frequently going up to 115 degrees and sometimes to 120 degrees. The mean temperature at night was 85 degrees Fahr., and sometimes the thermometer did not drop below 100 degrees during the night. There had been a large number of cases of sunstroke, many of them fatal. All precautions had, however, been taken by means of having cold and iced baths ready to deal with such cases at once.

In addition to the construction of the dam, a canal with a series of four locks had been built so that navigation might not be interfered with. In fact navigation was much more easily carried on than before the dam was built, as it had previously only been possible to get boats up the Cataract for a few months of the year, while now navigation could be carried on at all times. Another subsidiary work had been the underpinning of the Temple of Philæ. As portions of the temple were founded on silt it had been necessary to carry the masonry down either to rock or to the existing saturation-level so as to prevent any damage from settlement.

All the foundation-work of the dam had been completed the summer of 1901, and all the masonry in June 1902. The first stone had been laid by H.R.H. the Duke of Connaught on February 12, 1899. The contract quantity of excavation was 312,000 cubic metres (408,000 cubic yards), and the actual quantity done was 630,000 cubic metres (824,000 cubic yards). The total contract quantity of masonry was 370,000 cubic metres (484,000 cubic yards), and the actual amount built was 538,000 cubic metres (704,000 cubic yards). The quantity of excavation was, therefore, double that anticipated, and the quantity of masonry was 45 per cent. greater than the contract quantity. The work had been completed one year in advance of the contract time.

The second paper dealt with the sluices, lock-gates and general equipment of the Assuan reservoir.

There were 180 sluices, all of which were 6 feet 6½ inches wide, forty being 11 feet 6 inches deep, and the remainder being 23 feet deep. The sluices were placed at varying levels in the dam, the highest having a head of water of 19 feet 8 inches over the sill, and the lowest a head of 60 feet 8 inches. They were not counterbalanced, and were worked by hand-cranks arranged in the roadway on the top of the dam.

One hundred and thirty of the sluices were on the St. Paul principle, i.e. arranged with free rollers, the remaining being simple gates, which could be lowered at times when there was a small depth of water passing through the culverts. Twenty of the culverts of the low-level sluices were lined with cast-iron plates. These had been adopted in order to expedite the construction of the dam masonry.

The paper also described the five lock-gates which were of unusual design as they were arranged in a single leaf, mounted on an overhead carriage travelling on bascule girders, which could be lowered across the lock to carry the gate.

The gates were each 31 feet 2 inches wide in the clear, and were 59 feet, 59 feet, 45 feet 11 inches, 36 feet 1 inch and 26 feet 3 inches high respectively, the drop between each of four locks being about 20 feet. The lock-gates were worked by hydraulic power generated by a small turbine placed in the dam.

A bascule bridge over the locks and also the general equipment of the dam for examining and maintaining the work were described, as well as the separate lock lower down the river for taking boats past the rapids.

The making of the work and its erection in place were described by Messrs. Ransomes & Rapier, of Ipswich, who also described

THE WEEK.

THE career of the late Sir CHARLES GAVAN DUFFY, who died in Nice on Monday last, belongs to the political history of Ireland and Australia. He co-operated with THOMAS DAVIS in the endeavour to infuse a new spirit into Ireland, and DAVIS was an enthusiast for the employment by the State of art as an inspirer of patriotism. When DUFFY found it was no longer possible to overcome the lethargy which prevailed in Ireland he emigrated to Australia, and soon after his arrival in Melbourne the sum of 5,000*l.* was subscribed to give him the property qualification which was requisite in order to enable him to be a member of the Assembly. In a short time he was appointed Commissioner of Public Works. The objection was raised that as he had been all his life a newspaper writer, he was without any practical knowledge of buildings. Subsequently he became Minister of Lands, and eventually Premier of Victoria and Speaker of the Assembly. It was mainly through DUFFY's influence that art galleries were erected and pictures purchased in the Australian cities. His proposals were considered at the time to be only visionary, and it was believed that art could lead to no more than unprofitable expenditure in a young colony. But experience has shown that the progress in Australian cities has, in no small way, been caused by the refining influence which art confers. Like some of his Irish contemporaries, DUFFY held THOMAS CARLYLE in veneration, although so much against the country is to be found in the latter's books. Whenever DUFFY journeyed to London, he made it a duty to visit the philosopher of Chelsea, and on two occasions CARLYLE travelled with him in Ireland. DUFFY, in his "Conversations," tells us how, when walking in Hyde Park, CARLYLE spoke of the chaotic condition of English art. He compared the Albert Memorial to a wedding cake, with a gilded marionette on the top of it. The Houses of Parliament, he declared, wanted the unity of design which is apt to impress one in a work which is a single birth from one competent mind. THACKERAY told CARLYLE there was no reason for the river front coming to a stop, as there was no ending, and it might just as well have gone on to Chelsea. While DUFFY was Minister of Public Lands there was a township established on the Murray River, and this he named after CARLYLE. One street was called Jane Street, after Mrs. CARLYLE, while other streets bore the names of his friends, STUART MILL and STERLING.

It is sometimes difficult to understand the action which is taken by town councils and local authorities when advantageous offers are made to them. A case at Brighton is one of those puzzles. The late W. R. SUTTON, the carrier, left his property, which is estimated to be of the value of at least 2,000,000*l.*, for the erection of dwellings for the poorer classes in London or other populous places. The rents were to be determined by the trustees, and they considered that 2½ per cent. would be a sufficient return. The Sutton Trust are willing to spend some of the money in Brighton, and they have offered 6,000*l.*, or 7*l.* 14*s.* 9*d.* per foot frontage for land belonging to the Town Council. Each plot would cost 127*l.* A house that would cost the trustees 400*l.* to erect would be let for 7*s.* 6*d.* per week. The Town Council could not let a similar house under 11*s.* per week. Now, on the face of it the project seems to be advantageous, but a great many objections to it were raised by some of the members. It was said that property would be alienated which belonged to the town; that a class of tenants would be introduced who could not be considered as poor or belonging to the working classes; that it would be far preferable that a model village were erected on the outskirts of the town, and that more benefit would be realised by the working classes if they received an increase of wages. Eventually the offer of the trustees was accepted on condition that the work should be completed within two years. The experiment is, we believe, the first to be undertaken by means of Mr. SUTTON's savings. Other populous places will no doubt be desirous to have a share of the benefits that can be so

easily obtained. It is to be hoped that they will avoid an imitation of the churlish manner which was exhibited in Brighton. Gratitude, it is said, is a lively sense of future favours, but the conduct of so many members of the Town Council will hardly encourage the trustees to run the risk of building additional houses in Brighton.

THE jug belonging to the church at West Malling, Kent, will be sold by auction on Thursday next, the 19th inst., for the benefit of the church funds. It is described as of Fulham-Delft or stoneware, splashed purple, orange, green and other colours in the style of the old Chinese, and mounted with neckband, handle-mount, body-straps, foot and cover of silver-gilt, and is 9½ inches high by 5½ inches greatest diameter. It is doubtful whether the jug can be considered as a product of the Fulham factory. DWIGHT, who established the works, did not obtain his patent for "stoneware vulgarly called Cologne ware" until 1671, and the West Malling jug appears to have belonged to a still earlier time. There is no doubt the Fulham stoneware was an imitation of that produced abroad. In the first years of ELIZABETH's reign, which would be a century prior to the opening of the Fulham works, jugs and other vessels from Cologne were in favour in this country. They were mounted with English silver finely engraved in the style of the period. It is more likely the West Malling jug is an example of foreign ware, and that the metal embellishments are by English hands.

ALTHOUGH actions against railways for damages to property require the support of architects and surveyors as witnesses, it is doubtful whether so much professional skill was ever before employed as was seen in Mr. Justice RIDLEY's Court during the trial of the case *DAWSON v. The Great Northern and City Railway Company*. The premises in question belong to a draper, who claimed compensation for damages caused by the subsidence which followed the construction of a railway tube. Sir EDWARD CLARKE, who was one of the counsel for the plaintiff, said the case suggested the consequences of an individual having to take action against a wealthy corporation. At first liability was denied by the defendants. When attention was drawn to the cracks, they stated they would follow their usual course of reinstating any injury caused by their operations. The company professed to have only taken an easement of the land as authorised by the Act. In other words, they claimed to be allowed to bore beneath houses, and beyond filling in cracks which might occur in the walls, nothing more was necessary. It was even a part of the defence that the injuries were not caused by the company. When strategy of that kind is adopted it is of course necessary to have overwhelming evidence at command, and that means a large expenditure in fees. The defence might have succeeded, for it is not always easy to prove that the substructure of a building is in a sound state before underground works were commenced. Fortunately for the plaintiff, she contemplated some alterations in her property in November 1900, and Mr. C. R. MITCHELL, the architect engaged, was able to testify to the condition of the building. In 1901 cracks were visible, and the bottom of a pillar was fractured, leaving the shaft hanging from the girder it was intended to support. The company's representatives minimised the injuries, and ascribed them to sewer works in the neighbourhood. Mr. W. WOODWARD, Mr. PILDITCH, Mr. G. F. DEACON, C.E., Mr. H. H. COLLINS and others supported the plaintiff's case. The cost of repairing the structural damage was estimated by Messrs. PATMAN & FOTHERINGHAM at 3,957*l.* The loss of business during the work was said to be 3,208*l.*, and the damage to stock 1,500*l.* For the defence the sums named were—repairs, 500*l.* to 600*l.*; loss of business, 270*l.*; damage to stock, 400*l.* The figures are enough to show how insignificant was the damage in the eyes of the advisers of the railway company. When the divergence between the two valuations was so vast the jury must have been puzzled. They assessed the amount of damages as follows:—(1) For taking the subsoil occupied by the tunnel, 50*l.*; (2) structural damage, 2,000*l.*; and (3) damage to trade and stock, 2,100*l.*; total, 4,150*l.* The sum awarded is, therefore, less than a half of what was claimed. It would be interesting to know what will have to be paid for the law costs.

ANCIENT EGYPT.—BY W. F. YEAMES, R.A.

LOCAL AUTHORITIES AND THE AMENITY OF ENGLAND.

THE difference between the present and the former state of English municipal councils is not sufficiently recognised. It would perhaps be more correct to say that this difference is marked rather by their purposes than by their constitution. There is no doubt the oldest Anglo-Saxon bodies were elected like the town, county and parish councils of our day. Whether such constituted bodies were derived from the Romans or were essentially an Anglo-Saxon institution need not now be discussed. Their creation was almost inevitable. For the purposes of protection as well as for trade, people would endeavour to congregate, and the ancient *byrg* or *borough* is believed to have signified a collection of houses surrounded by some kind of wall which served as a fortification. Naturally each community would choose a head or *cyn*; a word which is supposed in later times to be represented by the word king.

The arrangements which prevailed prior to the Conquest were pushed aside when WILLIAM OF NORMANDY triumphed. The whole island became, as it were, his personal property, and he divided the spoil according to his own notions of rewards for services rendered. All the largest cities and boroughs he set apart for himself, besides some hundreds of manors, in which presumably towns were expected to be formed. Guildhalls were reserved by the King or handed over to his followers as if they were ordinary fields.

In the old days the revenue in towns was collected by a "borough reve," or a "port reve;" he was supplanted by a bailiff who sometimes was appointed through favour, but frequently gained the office by paying liberally for it. The revenue was, in fact, farmed, and the bailiff tried to squeeze as much money as possible from the inhabitants, not merely to enrich the royal exchequer, but to bring profit to himself. Wicked men are often made to serve beneficial purposes, and there is no doubt the rapacity of the bailiffs obliged citizens and townsfolk to combine. Magna Charta is popularly supposed to have been extorted by the force of Norman barons, but citizens co-operated with them, and hence one of the provisions was that all cities, boroughs or ports should be allowed to have their liberties and free customs, or, in other words, avoid irregular and excessive contributions. The monarchs still continued to make in addition claims of tallage, as a personal right supported by Anglo-Saxon precedents. Thus when HENRY II. wished to raise money for a crusade he demanded the presence of the principal citizens of London and York, as well as of the smaller cities and boroughs. A contemporary historian records that "the King took from them a tenth of their properties, according to the estimate of good men and true, that knew what income they had, as likewise what goods and chattels. Such as he found refractory he sent forthwith to prison, and kept them there until they had paid the uttermost farthing. In like manner did he to the Jews within his realm, which brought him incalculable

sums." It will be observed that the monarch did not have recourse to the agency of any corporate body. He simply coerced the wealthiest citizens and they were treated exactly as the foreign Jews.

It would be difficult to say whether the customs or duties of the representatives of the borough were more than obtaining the revenues which were to be paid, and the administration of the laws as magistrates. What the citizens appear to have been most anxious to secure was the privilege of election of those representatives, which seemingly was obnoxious to the monarch. In the time of HENRY III. an effort was made by the Court to force a mayor on the citizens of London without an election, but after a tumult the favourite of the citizens was installed. Besides the Common Council the different trades had their own guilds to look after their interests, but the general good of the inhabitants, it is to be feared, was neglected. The state of the London streets, for example, was for centuries disgraceful. Dirt was accepted as an irremediable evil. We have the testimony of the great scholar ERASMUS about the prevalence under HENRY VIII. of conditions that were fatal to life. He wrote to WOLSEY's physician in the hope of bringing about sanitary reforms and the diminution of deaths by plague. After describing the filth of the houses which sometimes made him feverish, this pioneer of sanitary reform proposed that public officers should be instituted to see that the streets were clean. It was optional with the citizens to perform or neglect that work, for there were no scavengers or sanitary officers, and all ERASMUS contemplated was the appointment of somebody to watch that the citizens did not neglect co-operating. Both HENRY and WOLSEY, like their predecessors, had interests which he deemed to be of more account than the cleansing of the thoroughfares of London, which for several centuries continued to be offensive both on dry days and on wet days when it was said:—

Now from all parts the swelling kennels flow,
And bear their trophies with them as they go;
Filths of all hues and odours seem to tell
What street they sailed from by their sight or smell.

We need no better evidence of the impotence that for generations characterised the London Corporation ædiles than the Great Fire. According to JOHN EVELYN's account, not the least effort was made in the City to stem the flames. Then when there was an alarm about the progress of devastation to Whitehall, the King ordered him to look after the quenching of the fire in Fetter Lane, and the preserving, if possible, that part of Holborn. EVELYN tells us that some stout seamen had proposed to save nearly the whole of the City by blowing up houses, "but this some tenacious and avaritious men, aldermen, &c., would not permit, because their houses must have been of the first." We have also the testimony of PEPYS, who was commanded by the King to tell the Lord Mayor to save no houses, and who, in walking along Watling Street, says:—"At last met my Lord Mayor in Canning Street, like a man

spent, with a handkerchief about his neck. To the King's message he cried, like a fainting woman, 'Lord! What can I do? I am spent; people will not obey me. I have been pulling down houses; but the fire overtakes us faster than we can do it.' That he needed more soldiers; and that, for himself, he must go and refresh himself, having been up all night." The Corporation were unable to deal with trifling works, and it was therefore absurd to expect them to cope with an extraordinary emergency like the fire of 1666. It was not, however, for capacity to deal with public works the members were elected. When we remember that a few years after the fire an Act was passed which made it illegal for anyone to hold the office of mayor, alderman, recorder, bailiff, town clerk, common councillor or other office in any city, corporation, &c., unless within a year he had taken the sacrament of the Lord's Supper according to the rites of the Church of England, it becomes apparent that a religious test and not one of skill or capacity was imposed.

We have another proof in the fact that when in later times the condition of a city or corporate town was supposed to have too much importance to be left to the haphazard attention of individuals, the responsibility was placed upon bodies of another class, which were specially organised. We hear of paving boards, commissioners for sewers, lighting, scavenging, &c., all of them at first being independent of the municipal corporation of the town, although of late years they have been more or less amalgamated with the elected body. The ancient corporations had degenerated and malversation of public money was common. Few of them were compelled to give account of their stewardship, and when in 1833 there was a parliamentary inquiry into the subject, it could not be concealed that in some cases the property of the Corporation was utilised for the private benefit of individual members. In one instance it was found that in order to raise 10,000*l.* to secure an election the property which belonged to the town was mortgaged without hesitation.

Fortunately so wanton a misappropriation of the common wealth is now impossible. Corporations great and small are not afraid of the trouble of acting as administrators as well as directors without the inconvenience of "itching palms." Indeed there is now a danger through undertaking such a variety of duties that all of them cannot receive the desired attention. There seems to be so great an eagerness for work, it was not amazing that Mr. JAMES BRYCE, M.P., should last week deliver a Warburton lecture in Owens College, Manchester, on "What Local Authorities may do for Art and Nature." If such a suggestion were offered to Sir THOMAS BLUDWORTH, the Lord Mayor of London in 1666, we are afraid he would have had another attack of fainting. But the representatives of local government in our time can do a good deal towards promoting general amenity without adding any great weight to the duties which they have to bear. There are now authorities not only in the towns but in the rural districts, and a parish council can sometimes render efficient aid.

Mr. BRYCE asks why some restriction should not be imposed on the setting up of advertisements which diminish the interest of places that possess natural beauties. As he says, all who travel are now accustomed to see big boards with letters in glaring colours stuck in fields, on the edges of copses, on the banks of smiling rivers, among the primroses and hyacinths in places where they ought not to be. The practice was imported from America, but in the States there has been a revulsion of feeling, and many districts enforce prohibitive regulations. It might be difficult to pass a general Act to prevent the spoiling of this country, but Corporations can easily obtain measures no less effective. It is through private Bills that Edinburgh can now be contemplated from one of the surrounding heights without the eye being disturbed by sordid announcements, and the foreigner is no longer forced to believe the English are mercenary by seeing the white cliffs of Dover proclaiming the advantages of certain quack remedies. Holland, Prussia and other States have set us a good example, and we suppose there would be little difficulty in acting on similar lines if it were not for the opposition of that great body, the Bill Posters' Union.

Railways, as Mr. BRYCE pointed out, have done much damage to natural scenery. Seventy years ago WORDS-

WORTH the poet protested against the invasion of every nook of English ground and the sacrifice of peace and beauty to clear a way for steam's triumphal car. But he afterwards seems to have accepted the inevitable, for he realised that crowds of people would be enabled to visit Westmoreland. Of late years railway engineers are more respectful towards nature, but they also are subjected to economy, and in cases where a cutting or a tunnel would be preferred, they have to substitute an embankment. That, too, is one of the reasons which make a common used instead of fields. Mr. BRYCE says that local authorities should be accepted as the guardians of the beauties of their localities, and they should interpose to prevent the wanton destruction of picturesque scenery. It indicates progress that an appeal on that account would be listened to with attention in Parliamentary committee-rooms, although a very few years ago it would be disregarded. Mr. BRYCE is not satisfied with what is done to abate the smoke nuisance. In all cases non-interference does not mean indifference. Wherever there are tall chimneys there are generally a great many people employed, and a summons may sometimes lead to a suspension of works which will cause much misery.

It is the same cause which is assigned for the pillage at the Falls of Foyers—one of the few scenes which surpassed description or pictorial representations of them. But the utilising of the waters of the Anio as they are precipitated at Tivoli—or rather at Tibur, for the Greek name should be respected—is a still greater offence, for a scene is degraded which has received recorded admiration beyond any other in the world. But the Italians, while professing to be as appreciative of the scene as their ancestors, say they cannot afford to dispense with so much motive power. As elsewhere beauty has to succumb to utility.

There is no excuse of that kind available for the neglect of village greens, to which Mr. BRYCE referred. It cannot be said that much improvement has been visible since the establishment of county councils. All that is in most cases to be considered desirable is resistance to neglect; but not even that amount of care is permitted.

The amenity of towns would be enough to occupy by itself a lecturer's attention. Mr. BRYCE, who is laudatory of American institutions in general, would have us imitate the art commissions which are now being formed for any kind of æsthetic work. It cannot be said, however, they have done more than offer suggestions, a kind of contribution which is abundant among us. Mr. BRYCE expects the professorship of architecture in Manchester will form a nucleus for a similar art commission. He considers there should be greater control over designs of buildings by local authorities, but architects will not be found to favour such an addition to municipal duties. Mr. BRYCE is also in favour of a more systematic laying-out of streets, although he prefers the variety of building designs which was common in Mediæval towns to the tedious and monotonous uniformity of such a city as Paris. He admits the difficulty of dealing with a city which has no heights to offer as sites for public buildings. The Manchester Town Hall and Assize Courts, which are among the finest modern Gothic buildings, lose, he says, much of their effect from the flatness of the ground on which they stand.

In conclusion, Mr. BRYCE told his audience there were five requirements essential in every city which aspired to intellectual life. It ought to have its library, in which archives and local records were stored; its natural history museum, with everything appertaining to the geology, the botany and the zoology of the district; its historical museum, in which might be traced the history of the city or district from prehistoric times; its commercial museum, containing specimens of all the industries of the neighbourhood and the natural products used; fifthly and lastly, its art galleries. All these ought to be in an organic relation to each other, and in relation also to two central authorities, one the municipality and the other the university.

The cities of the future are fortunate because they can be laid out to correspond with those and similar requirements. But it is not clear how such a grouping as is suggested could be attained in Manchester unless by an expenditure that is never likely to be at the disposition of the authorities. It is well sometimes to feel our deficiencies, and it may be said with confidence that not one city in

England approaches the modern and visionary ideal. There is, however, some satisfaction in believing that the doctrinaires of the future will also have their ideals which will be unlike any we can now imagine or devise.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER V.

PROPORTION, BALANCE.

IT has been remarked earlier that "the relation that *scale* implies between two adjacent or neighbouring buildings, in regard to size and importance, *proportion* similarly implies respecting the various component parts of each building, one with another."

It is easier by far to satisfy the requirements of proportion than those of scale or perspective effects. It may be readily conceded that the faculties, in a large number of instances, must be trained to an accurate perception of good proportion, and it is one of those lessons that may be learned with comparative facility. The ancient Greeks were masters of accurate proportion, but it is a permissibly moot point whether their treatment arose from scientific or from artistic perception of pleasing effects. It was probably easier for a Grecian artist to obtain his chaste contours and satisfying proportions in a building by his own æsthetic instincts, than it would have been for him to work by rules that one moulding must be $\frac{3}{2}$ of another, and $2\frac{1}{2}$ times the size of yet some other moulding. It may have been perceived that some simple proportional value gave a pleasing effect for certain features, and this may have become a guiding principle for approximating the proportions of masses;

FIG. 33.—SECTION OF BAPTISTERY, PISA.
(From Gwilt's "Encyclopædia of Architecture.")

Showing inconclusive results when juggling with proportional setting-out.

but the attempt to establish a hard and fast system of proportion by the use of numbers, or of geometrical figures, fails even in the examples put forward by the advocates of the various systems. The failure lies in the fact that in spite of the juggling with numbers and diagrams, the results are admittedly inexact. In GWILT'S "Encyclopædia" we read that "a discrepancy between practice and theory, unless extremely wide, must not be allowed to interfere with principles." This is indeed true, but principles and "rules" are two different matters, and should not be confused. If rules of proportion by numbers or by geometrical figures are to be established, it can only be by exactness of examples (not by mere approximation), and by the production as examples of numerous buildings that are admittedly well-proportioned, and not merely by one or two such structures, or, on the other hand, by a heterogeneous collection. To take a concrete example, in the Baptistery at Pisa (fig. 33), as treated by the late EDWARD CRESY, the diagrammatic effect is ludicrous, as the tangential results are frequently at unimportant positions, and these results would be unlikely to recommend themselves to any artist, ancient or modern.

As the outcome of measurements in Lincoln Cathedral, an architect triumphantly stated that, "Very careful measurements immediately above the plinths give voids 1,056, supports 107, or the former *nearly*" (mark!) "ten times the supports, including in the latter the external buttresses and walls; and including in the voids the clear internal area of the church."

Again, we read that "The square and its diagonal, the cubes and its sides appear to furnish the unit on which the system is based. Hence, the numbers 3, 5 and 7 become the governing numbers of the different parts of the building. The unit in the Latin cross, placed at the intersection of the nave, gives the development of a perfect cube. . . . Here are found the number 3, in the arms of the cross and the centre square; the number 5, in the whole number of squares, omitting the central one; and the number 7, counting them in each direction."

This also is not by any means convincing, and the juggling elsewhere referred to is apparent in the arbitrary omission of one square to establish the number 5, and its equally arbitrary inclusion twice over to establish the number 7.

The following quotation, too, bears an interest in the same connection, and recalls the saying concerning the disagreement of doctors. "The number 10 was, according to VITRUVIUS, PLATO'S perfect number; but the anti-Platonists with their 6 (or the radial division of the circle) could, by the working of their centres . . . produce the 10, showing that they were the more perfect (*sic*), as their system combined with all others."

That the ancient and mediæval architects planned their important buildings on geometric forms is most probable and similarly in designing window and other tracery; but to anything beyond this it is permissible to demur. It is not a matter where dogmatic assertions avail, and the production of well-proportioned buildings, if not the result of intuition, may be obtained by careful study of examples ("what to avoid." Artistic proportion and feeling reached their zenith in the age of PERICLES, and declined more or less steadily thereafter, though at the present day there is healthy revival of feeling for good proportion. . . . St. Paul Cathedral is, however, a brilliant example of proportion treatment; had the western towers been loftier to any great extent, it would have proved detrimental to the supremacy of the dome, and indeed the happy proportional effects of this building are apparent from whatsoever point it is viewed. In spite of all contention to the contrary, it is fairly evident that our masters in art, the Greeks, were not too severely fettered by hard-and-fast rules, as a careful inspection of cotemporary buildings of theirs will show.

Mr. GWILT, referred to earlier, promulgates in his "Encyclopædia of Architecture" a series of maxims, some of which are certainly well worth noting and studying; and as, perchance, they may be overlooked amidst the mass of material in that colossal work, they may be aptly transcribed here.

(1) Let that which is the stronger part always bear the weaker.

(2) Let solidity be always real, and not brought to appear so by artifice.

- (3) Let nothing be introduced into a composition whose presence is not justified by necessity.
- (4) Let unity and variety be so used as not to destroy each other.
- (5) Let nothing be introduced that is not subordinate to the whole.
- (6) Let symmetry and regularity so reign as to combine with order and solidity.
- (7) Let the proportions be of the simplest sorts.
- (8) Recollect that nothing is beautiful which has not some good and useful end.

The student is then advised "to test his design by these maxims seriatim, and to strike out whatever is discordant with their tenour"; and Mr. GWILT justly remarks that "in architectural subjects, instability, or the appearance of it, is fatal to beauty."

There may, however, well be a difference of opinion as to the practical value of some of Mr. GWILT's maxims; all look well enough on paper, but it is allowable to question Nos. 3, 6, 7 and 8. No. 3 elevates the art of design into much too rarefied an atmosphere; No. 6 needs elucidation, its meaning being very obscure; No. 7 apparently implies an arithmetical treatment for proportion, and this is to be deprecated entirely, as good proportion is dependent on artistic perception.

No. 8 is of the same nature as No. 3, and, whilst there is fundamental truth in both, the comprehensiveness they convey is apt to prove misleading. The other four maxims are of the highest value.

In bringing to a conclusion quotations from other writers, it may be interesting to transcribe the following maxims which the late AUGUSTUS WELBY PUGIN held to be the keynote of Christian architecture. Mr. PUGIN's maxims are numerous, but those only are given which seem suitable for works generally:—

- (1) There should not be any features about a building which are not necessary either for convenience, construction or propriety.
- (2) All ornament should consist of enrichment of the essential construction of the building.
- (3) The design should be adapted to the material in which it is executed.
- (4) The external and internal appearance of an edifice should be illustrative of, and in accordance with the purpose for which it is destined.
- (5) It is a defect to make the two sides of a façade correspondent if their purposes differ.
- (6) The elevation should be subservient to the plan.

It needs constant experiment to obtain just that happy effect of proportion that will satisfy the eye of the educated observer, and that will tend to educate the untrained. It is but writing from personal experience to remark that it requires infinite pains to be taken in order to obtain the exact pleasing proportion for some specific object. For mouldings of all kinds, an architect will be well advised to avoid "stock" varieties whenever possible, and to design the mouldings to suit their position.

If proportion is a desirable consideration, so also is *balance*. This quality, as its name implies, denotes the possession of equilibrating effects in any object. For example, referring to fig. 34, the plan, though very irregular,

Façade Plan of Irregular Outline

FIG. 34.

has a well-balanced elevation in fig. 35; had the bay window been merely utilised on the ground floor, and had the porch been carried up to form a bay, the effect would have been very different and far from satisfactory; in fact, it would constitute a "want of balance" (see fig. 36).

Balance, like proportion, is a quality that cannot be satisfied by the observance of any hard-and-fast rules. It holds for architecture a similar place to the requirement in

pictorial design of "composition"; whilst certain features should have a certain degree of prominence given to them, none should be so pronounced as to destroy the unity of the whole conception; each and all should act for the common good. Nor does this preclude the enjoyment of

Elevation emphasizing previous Plan.

FIG. 35.

Want of Balance

FIG. 36.

varied treatment, but rather tends to encourage it. "Unity with Variety" is a desideratum in all design, whether pictorial, plastic or architectural. The story of the contention for precedence that arose between the various members of the human frame is an old one, and is applicable generally.

The *variety* will not be disputed amongst those who are cognisant of the formation of the human frame, and the *unity* is apparent when fair play is allowed to the functions of the different organs.

Where a design is kept absolutely or approximately symmetrical, balance follows as a natural result; nor need a symmetrical façade be tame, as many notable buildings testify.

Diagram illustrating Want of Balance.

FIG. 37.

The following illustration may help to explain—to crystallise the meaning of the term "balance." If a pair of scales be unequally loaded, having, say, 1-lb. weight in one scale and 5 lbs. in the other, the difference in level will create a feeling of unrest, of dissatisfaction, in an onlooker. In order to obviate this, it is quite immaterial whether balance is obtained by one 5-lbs. weight being placed in each scale, or by equilibrating to, say, the higher figure, by means of two or more of smaller denomination.

Consider, again, another illustration. If it be desired to hang several framed objects on a wall, the sizes varying indefinitely, it may be impossible to obtain symmetry (whether desirable or not may for the purpose be disregarded). Fig. 37 shows the result that might easily arise from hanging the objects without method or artistic perception. The "want of balance" is pronounced (it may be remarked that the first shapes that came carelessly to the pen were jotted down for the purpose). It is of course at once apparent that a symmetrical arrangement cannot be

Diagram illustrating Attention to Balance.

FIG. 38.

produced, but some such method as illustrated in fig. 38 will give proper balance.

(To be continued.)

THE GEORGIAN PERIOD.*

IT is easy to understand how artists and writers who have been engaged in the representation and description of buildings in the newer cities of the Northern States of America should, on arriving at the South, be loath to quit districts where genuine examples of eighteenth-century work have survived. We have already noticed the part of the "Georgian Period" relating to North Carolina, which presents buildings that are attractive to English eyes. In 1662, when CHARLES II. made the grant of the great district known as Carolina, and extending from north to south for about 300 miles, there was an expectation that the loyal cavalier principle should thrive there on a scale that was no longer attainable in England. But people were somewhat slow in emigrating. It was not until 1680 that the fine site of Charleston on the coast became a settlement. As we stated on a former occasion, JOHN LOCKE prepared a scheme or constitution for the region. But in 1719 it was necessary to have a separation between the two divisions of Carolina, and each became more closely connected with England, which was looked upon more than ever as the supreme authority.

A glance at the map is sufficient to suggest the character of South Carolina. The coast-line is indented with a number of small bays, into which rivers run. The chief of them are the Pedee, the Santee and the Savannah, and they receive the water of numerous tributaries. Under such a sky it is hardly possible to have low grounds and large rivers without luxuriant swamps. But the adjoining plains are most fertile. For agriculturists there could not well be a more favourable district. The English gentlemen who emigrated there must have found much to compensate them for their exile. THOMAS DRAYTON, for example, who had lived in Barbadoes, having obtained a grant of several thousand acres, settled on the banks of the Ashley River, and named the place "Magnolia on the Ashley," owing to the magnificent trees that were profuse there. Drayton Hall, which was founded by his son, was called after the family estate in Northamptonshire, and it is the only old family mansion in the district which was not burnt down in SHERMAN'S invasion. The history of it may be taken as applying to some other mansions:—

The hall itself cost 90,000 dollars, all the materials being imported from England. It is still in excellent preservation although unoccupied, and is built of red brick with columns of Portland marble. The staircase, mantel and wainscot, which extends in quaint fashion from floor to ceiling, are of solid mahogany richly carved and panelled. Over the mantel are stationary carved frames for family portraits and heraldic devices; and the great fireplace is inlaid with antique coloured tiles. To this day many stories are told of the dinners and balls held at Drayton Hall in the great old days, when the house would be ablaze with a thousand tapers, and carpets were laid down the staircases, front and back, and across the gardens, so the ladies might alight from their carriages and enter the hall without soiling their delicate slippers or the airy lace and satin of their robes.

The houses were planned in order to allow of the exercise of a generous hospitality. The Englishmen of those days were not disturbed by a vast variety of architectural examples. When they said to their architect or builder they wished to have an "English mansion," the phrase was sufficiently definite. The commission was carried out with so much success that if a great many of the residences shown in the plates were presented without tiles and with less luxuriant vegetation as surroundings, they would be accepted as buildings which still survived somewhere in the English provinces.

The Englishmen were not without imitators. A colony of French Huguenots was established on the Santee River. Such family names as HUGER, PORCHER, RAVENEL, LEGARÉ, ST. JULIEN, PRIOLEAU, DU BOSC, DE SAUSSURE, LAURENS, MAZYCKS, MANIGAULT, are yet met with in the district. The foreign immigrants do not appear, however, to have introduced any French features in their buildings, and perhaps they found that the English mansion sufficiently met the requirements of the time and place.

There is no mistaking the two churches reproduced, St. Michael's and St. Philip's in Charleston. They are of the orthodox Classic type, and were unquestionably derived from the eighteenth-century churches in London. One was opened in 1723, the other in 1761. St. Michael's has been attributed to a pupil of WREN'S named GIBSON, and a contemporary description of the feast at the laying of the foundation-stone in 1752 says:—"The church will be built on the plan of one of Mr. GIBSON'S designs, and it is thought will exhibit a fine piece of architecture when completed." The "Charleston Year Book," however, of 1886 states:—"The name of the architect is given as GIBSON, a name of which we can find no mention elsewhere, but JAMES GIBBS was the designer of St. Martin's-in-the-Fields, London, and a legend tells us that our church is a copy of that building. A glance at the pictures of the two shows this to be an error, and one is puzzled to account for the story. If, however, they were planned by the same person we can see how the error arose. Add to this the similarity of GIBBS and GIBSON, and the fact that the spires of both churches spring through the roof, and the further fact that GIBBS lived until 1754, and we think there is little doubt that St. Michael's was the work of GIBBS." The church does recall GIBBS'S style, and it should be remembered that in 1728 GIBBS published a large folio of details which would enable an architect in Charleston to make plans of a building possessing some affinity with St. Martin's. St. Philip's Church is not the original structure, which was, it appears, an imitation of GIBBS'S building. That church was destroyed by fire in 1835. The congregation resolved that the building should resemble St. Martin's-in-the-Fields, especially in the interior. The steeples of the two churches during the siege of Charleston served as targets for Federal guns, and several shells entered St. Philip's.

The question is discussed where the bricks came from which were used in the buildings of South Carolina. It is a common belief in the district that English bricks were employed. Colonel ESMOND, according to THACKERAY, freighted ships from New York with Dutch bricks, and imported mantelpieces, cornices, sashes and glass. It is now maintained that bricks could easily have been made in South Carolina, for suitable clay is found in many places. They may not have been "sound, hard, square, well-burnt truly-shaped, ringing bricks free from flaws and other defects," and from the circumstance that the exterior of the buildings are covered with rough-cast it is not unlikely

* *The Georgian Period.* Being Measured Drawings of Colonial Work. Illustrations by E. Eldon Deane, E. P. Morril, C. M. Bell. Part XI. (*American Architect and Building News Company.* London: B. T. Batsford.)

there was a desire for concealment. Notice is taken of one church at Old Wamboro in French Santee as the best existing example, "for it is a consistent piece of brick masonry from end to end; walls, floors, steps, bases, shafts, capitals all are of brick laid with such care and skill as evidently to have required little attention and repair since the original builder struck the last joint in 1768."

Besides the illustrations in the text there are twenty-five plates in the eleventh part. They represent the secular and ecclesiastical buildings of the Georgian Period which have come down to us. There is no design that can be regarded as the work of extraordinary genius. The charm is that they should preserve so many characteristics of home at a time when South Carolina could not be reached without undertaking a long and inconvenient voyage. It is English architecture beyond the Atlantic which is again presented, and deserves to be recognised as such in both continents. There seems to be a likelihood that the southern buildings are destined to be supplanted by others of modern type, for in many of the rooms we see no evidence of use. On that account it is well to have records of the admiration which the colonists of South Carolina and their descendants bestowed on English work, and of which they made models for imitation in building their patriarchal mansions.

WEST WINDOW, EXETER CATHEDRAL.

THE following letter from Mr. Stuart A. Moore, F.S.A., has appeared in the *Times*:—

There seems to be a chronic mania in the authorities of Exeter Cathedral for destroying every relic of ancient art in that wonderful building whenever an opportunity occurs. It is now proposed to destroy the glass in the great west window, which is the best work of William Peckitt, of York, the glass-painter who did his best with the materials at his hand to keep alive the art of glass-painting in England. In doing so he did what scarcely any modern glass-painters have done, that is, he considered the necessities of the lighting of the building and subordinated his window to the intention and design of the original architect by erecting a light-giving but decorative window which allows the full effect of the beautiful groining and decorated columns of the cathedral to be seen. The glazing of the cathedral can be traced in the fabric rolls. The bills for the glass show that the highest proportion of colour to white glass was one-fourth of colour, while in the side windows it was even less. The designs of them were traced by Mr. Drake, the glass-painter of Exeter, by piecing together the fragments which remained, and there can be no doubt that Exeter, as glazed by its original architect, was brilliantly and suitably lighted. Peckitt must have observed this, and has done his best endeavour to treat the west window in the same spirit. It would be a grievous thing if such an example of his work, so suitable to the building, should be swept away to make room for the usual modern painted blind.

When the cathedral was restored by Sir Gilbert Scott the authorities nearly persuaded him to remove the great east window with its ancient glass, which is one of the glories of the place, and to replace it by a wheel window of his own design; but I showed him the entry in the records which ordered the erection of the Perpendicular window, and showed its date, and he thereupon declared that nothing should induce him to alter a piece of dated work, and the window was saved. The Freeman memorial window in the south chapel would have been swept away but for the protests of the late Archdeacon Freeman and myself. It is the most perfect piece of decorated glass in England. I found in a loft above the minstrels' gallery almost the whole of one of the original clerestory windows of beautiful grisaille work, and ample remains to insure its perfect restoration. I offered to restore it on condition that I might employ my own glass-painter, but this was refused, and I now hear that the window has disappeared altogether. I have vainly endeavoured to get the authorities to have drawings made of the original designs of the side windows in the choir so that they might be restored when opportunity arose, but without success, and very unsuitable windows have been erected in their place. To take out the glass of the west window would be the worst possible way of erecting a memorial to Archbishop Temple, and one that I am sure would have been very distasteful to him, for I well recollect pointing out to him when he was at Exeter the singular beauty of the glazing of the cathedral, and he remarked upon the brilliancy and suitability of Peckitt's window to me at the time. Surely if the proposed memorial is to take the form of a stained-glass window some other window can be chosen, and if it be chosen I trust that the authorities, and the

glass-painter whom they may employ, will have the modesty to consider the character of the ancient work, and to erect a brilliant light-giving window which shall not blot out the light and destroy the beauty of Exeter Cathedral as has been done in so many other places. One could wish that Milton had never penned those lines about "storeyed windows richly dight," which "shed a dim religious light." A dim religious light may appeal to some members of the clergy, but those unlucky lines, misunderstood, have been the curse of glass-painting and the destruction of the beauty of most of our cathedrals.

ROMNEY AND HIS WORKS.

AT the Royal Institution, Sir Herbert Maxwell gave a lecture on Friday night on "George Romney and his Works." At the outset, he said it was remarkable how many men had risen to eminence in the fine arts from humble birth and narrow means, and at first it was not easy to see the reason of this, as it would appear easier to start a lofty flight from a first floor front than from a dark basement. It would seem as though one should look to those of leisure, competence, and, above all, of liberal education. But, as a matter of fact, it was time, which the leisured could not give with that wholeheartedness which was required for excellence. Those who shrank from making complete sacrifice could not attain excellence, and the man who had most to sacrifice was the one most likely to shrink. Genius was not the monopoly of one class of life. He would not, however, go into the abstruse question of genius. Thinking that as names of humble people often come from places, he had searched for such in the North of England, where the surname Romney was not uncommon. But he found no such place, and it had been suggested by one who bore the name that it was originally Romany, for when gipsies were liable to be hanged some four centuries ago they collected much in the border counties. Then Sir Herbert Maxwell sketched the career of his subject from the time he found his father's trade of carpenter distasteful and through his schooldays, his youth, when it was doubtful whether he would follow the muse of painting or muse of harmony, to that when he was apprenticed to Steele, an eccentric artist who had learnt from Carl van Loo, and who inculcated some sound principles, especially with regard to grinding and mixing colours. Then followed the well-known story of Steele's elopement with an heiress, and of Romney falling ill, when his landlady's daughter nursed him and in gratitude he married her. He was then twenty-one, and having no means he soon after decided to leave her at Kendal and seek his fortune, feeling that he required wider acquaintance with the world, and giving eager audience to the voice of ambition. No complaint seems to have been made by the wife of quiet presence; but it had not been demonstrated that the common report was correct as to his having deserted her. Romney, however, all through his life was resolute only to one thing—his art. He sold a score of his pictures for 100*l.*, and, giving his wife half, he came to London with the rest, and soon had a few sitters. He felt his disability from not knowing foreign art, and, with his friend Green, spent six blissful weeks in Paris. His personality was one of intense shyness, with none of that charm which Reynolds had in exceptional degree. It was said that Romney was, of all persons, the easiest to wound. When relieved from pressure for money, he began to see how unsuitable his wife would be in such environment as his, and his life became a lie, for it was not known he was married, and to a nature so reticent as his this secrecy was disastrous. When he paid Kendal a visit he found one of his two children dead, and his wife and the boy living at her father's. He went on to Lancaster, and had as many commissions as he could do, but injudicious friends persuaded him Reynolds was his enemy, and he never sent to the Royal Academy. He went to Rome with Ozias Humphry for two years, and worked with energy, and soon after his return to London executed that lovely group of the Gower children. Sir Herbert Maxwell then spoke of Romney setting up in Cavendish Square, of the Lady Hamilton infatuation and of the many charming canvases she had furnished in her own and in fancy characters. That Romney was not wholly selfish was shown by his having relieved his brothers from serious money difficulties.

Many of his most lovely pictures, "Mrs. Lee Acton," "Lord Westmoreland," "The Seamstress," "Mrs. Carwardine" and others were thrown on the screen, and interesting facts were given with regard to the original price or the first auction price of some of these and what they obtained when last in the sale-room. Of the exquisite full-length, Mrs. Lee Acton, it was said it brought the painter 120*l.*, and the present owner refused an offer of 16,000*l.* for it the year before last. Sir Herbert wound up with touching words regarding the beauty of Mrs. Romney's character.

NOTES AND COMMENTS.

THE difficulty of finding titles for the new streets between the Strand and Holborn can only be estimated by those who have attempted to discover them. In the first place, it would be allowable to suggest the connection of the County Council with the work. In the next place, there are historical associations with the district traversed which deserve to be signalled. In the third place, the time of the commencement or the completion of the undertaking has also a claim. A great many names were brought forward, but they did not meet with popular approval. The general purposes committee of the London County Council have hit on a solution which has much to recommend it, and it was adopted on Tuesday. "Wick" or "wich" is a familiar termination in place names, and originally it seems to have signified a village, or, in some cases, a bay or creek. It is supposed that "wych" is the same word, although it was more often used in connection with trees. The name Wych Street was a survival of the title of an ancient street or road known as "Via de Aldwyche," which some believe was applied not only to the street which opened into the Strand, but also to Drury Lane. It may have originally referred to a Danish settlement called Aldwyche. The committee suggested that it should be applied to the curved street at the southern end of the improvement. The name in itself appeared to be suitable in every respect. It was short and simple, thoroughly English in form, and did not conflict with any other street name in London. For the main street no better name could be found than Kingsway, which, strange to say, is not employed in any other thoroughfare in the Metropolis. It is not only an opportune title, but to the County Council and others it may express the superiority of the new highway beyond most others. We hope care will be taken that the buildings erected in Kingsway and Aldwyche will be worthy of such distinctive titles, and will not be of a commonplace character.

WE have already mentioned that a commission was given by the King of the BELGIANS to M. CHARLES GIRAULT, the French architect, for the enlargement of the palace of Laeken. The plans are now complete, and excavations have been commenced for the foundations of the new buildings. Laeken is about 9 miles from Brussels, and the palace was erected as a summer residence in 1782 by the Archduke ALBERT. The additions now proposed will consist of two wings, each of which will be more important in an architectural sense than the main building. The right will contain the royal apartments, the chapel, riding-school, stables and coach-houses. In the left wing will be found rooms for the receptions, a *salle des fêtes*, a picture-gallery and a grand staircase, which will be connected with a special branch railway in communication with Brussels. The King of the BELGIANS is so great an admirer of French art, his subjects were not surprised at the employment of M. GIRAULT. At the same time it seems extraordinary that among the numerous and clever architects of Belgium not one is held to be capable of producing a suitable design for a palace.

THERE is no race more disposed to appreciate metamorphoses than the French, and consequently their history is a series of transformation scenes. M. FORMIGÉ, the architect, has been enabled to become the agent in one which is particularly interesting to the mind of the people. Having undertaken to design the pedestal for the statue of GAMBETTA about to be erected in Bordeaux, he went a few days ago to examine the site selected for the work. The weight of the memorial will be so heavy too much care cannot be taken with the foundations. Accordingly M. FORMIGÉ ordered some boring to be done. It did not take long before it was discovered that a hard stratum existed. The ground was opened and then it was ascertained that the same site had been chosen for a large equestrian statue of NAPOLEON III., and the foundations had been prepared when the empire collapsed. The people of Bordeaux had forgotten their imperial enthusiasm in little more than thirty years. The GAMBETTA memorial will thus exemplify the temporary triumph of republican

ideas. But there is likely to be misgivings that they in their turn will be superseded.

THE Institution of Electrical Engineers have issued through Messrs. E. & F. N. SPON a "form of model general conditions recommended for use in connection with contracts for plants, mains and apparatus for electricity works." To it are appended a form of tender and a form of agreement. Suggestions from it might be derived for those undertaking works of other descriptions. For instance, the ordinary complaint about misunderstanding the meaning of specifications or drawings is obviated by the following clause:—"If the contractor shall have any doubt as to the meaning of any portion of these general conditions or of the specification he shall, before signing the contract, set forth the particulars thereof and submit them to the engineer in writing, in order that such doubt may be removed." The engineer is expected to express in writing the reasons for his decision in case of dispute:—"In respect of all matters which are left to the decision or certificate of the engineer, the engineer shall, if required so to do by the contractor, give in writing a decision thereon, and his reasons for such decision, or if he shall withhold any certificate then his reasons for so doing. All decisions of the engineer shall be subject to the right of arbitration reserved by these conditions." The general recognition of arbitration is more fully defined by another clause, which says:—"If at any time any question, dispute or difference shall arise between the purchasers or their engineer and the contractor, upon or in relation to or in connection with the contract, either party may forthwith give to the other notice in writing of the existence of such question, dispute or difference, and such question, dispute or difference shall be referred to the arbitration of a person to be mutually agreed upon, or failing agreement, to some person appointed by the President for the time being of the Institution of Electrical Engineers." Works of electricity have become so common in connection with buildings, the advantage of the model conditions to architects is apparent without any further commendation.

ILLUSTRATIONS.

COMPETITION DESIGN FOR HARROGATE MUNICIPAL BUILDINGS.

WELLS ROAD BOARD SCHOOL, BRISTOL.

THIS school was erected at Wells Road for the Bristol School Board, from designs prepared by Mr. H. DARE BRYAN, F.R.I.B.A., of College Green, Bristol.

Accommodation is provided for 810 children (560 in the mixed department and 250 in the infants'), and an enlargement is possible by the addition of two classrooms for 50 children to each department. The architect, in accordance with instructions from the Board, has made good use of the basement of the school by providing a centre for the teaching of household management. Not only have a cookery-room and a laundry-room been provided, but also a model sitting-room and a model bedroom. Attached to the school is a wood workshop for the boys. One of the chief features of the scheme is the fine central hall of the mixed school, 80 feet by 35 feet, which, in addition to educational purposes, can be used for public meetings of ratepayers and similar functions.

The building has stone walls faced with red Cattybrook brick, with Bath stone dressings. The roofs are covered with red tiles, and the floors generally are of wood blocks on concrete; the playgrounds are asphalted, and surrounded by a dwarf wall with railings and gates of wrought-iron. The buildings are warmed on the low-pressure hot-water system, with ventilating radiators at convenient points.

BUTCHERS' HALL, EASTCHEAP, E.C.

CATHEDRAL SERIES WORCESTER.—LOOKING NORTH-WEST ACROSS THE NAVE

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair. The following were elected as members:—Messrs. W. Sykes George, T. C. Mannoch, P. H. Keys, Gordon Williams, I. C. Goodison and J. W. Simpson. Messrs. A. B. Burnell and H. Kerr were reinstated members. Professor G. BALDWIN BROWN read a paper entitled

What is the Real Value of Greek Work to the Modern Artist?

In one sense no apology is needed for introducing before an architectural audience the familiar subject of the artistic work of the Greeks. The supremacy of the Greeks in some of the branches of the plastic and constructive arts, their excellence in all, are universally admitted, and the advantage for the modern practitioner of a study of acknowledged masterpieces cannot possibly be gainsaid. But one remembers the old story of the Athenian citizen who voted for the banishment of Aristides, because he was weary of always hearing him called "the just." It is possible that in like manner some who are here present may be a little tired of having the unapproachable excellences of Greek statues and buildings set continually before them as a sort of reproach to modern shortcomings. If voting could be quite secret, and no one could know who had put in the black balls, a ballot among the younger and more ardent members of the professions of architect or statuary might result in something like a temporary ostracism of Pheidias and Ictinus, who could be followed into exile by Vitruvius and all his Renaissance imitators. It is quite possible, at any rate, that there is latent in some minds a certain feeling of impatience with regard to the exalted claims which are sometimes put forward on behalf of the arts of Greece, and it should be said at the outset that this paper is not written from the point of view of the professed classicist, in whose judgment the ancients could do no wrong. There will be some attempt, at any rate, to discriminate between what is of lasting and universal value in Hellenism, and what was for the time only or was imperfect, or even on faulty lines. At the same time it is to be feared that the "justness of Aristides" will figure very largely in what follows, and those present must put it down to the nature of the subject rather than to the writer's intention if he fall at times into the sermonising vein. The theme of Greek work is not a "subject of the day." It does not "palpitate with actuality" or "bristle with points of controversy." It does not offer the interest of a fight. A generation ago this kind of interest would have attached to the subject, for there was then a pronounced antagonism between the votaries of the classical and romantic ideals, that is now quite out of date. In the first half of the last century romanticism in literature and in architectural practice was militant. Its attitude towards the neo-classicism of the previous generation was an aggressive one, and in France, at any rate, where they take these artistic questions seriously, the adherents of the two schools nearly came to blows. This intensity of personal feeling belongs to the past, and the Law Courts at Temple Bar represent perhaps the final effort of the Gothic revival as a form of artistic propaganda. In the present day we have settled down to a reasonable eclecticism that sees good in most of the established traditions.

This eclecticism is not a symptom of decadence, it is not a Laodicean indifference, but rests on an easy confidence that we are the "heirs of all the ages," and, from our place "in the foremost files of time," can survey the past and appropriate from it whatever seems to suit our personal needs. No one in the present day will break his lance upon the Greek façade in the spirit in which Ruskin tilted against it in his "Lectures on Architecture and Painting." The opposition which in the present day the votary of classicism will have to meet is not a militant opposition. He will find in some quarters people who are slightly bored by Hellenic achievement, and though they accept it as beyond the reach of criticism, decline to trouble themselves to analyse its qualities or to assimilate its standards. He will find in other quarters a tendency to accept Greek work in a somewhat patronising spirit, with the proviso that it must have got a little fuzzled and warped and wavy through the lapse of ages, before the sensitive modern eye can take delight in it. Is it not the case that the Mediaevalist will sometimes offer a sort of apology for his admiration of Greek work, on the plea that, as we now possess it, its charm is so largely aided by the mellowing touch of time? The sculptor of to-day will sometimes tell us that the corroded condition in which works like the Elgin marbles have survived is to their advantage as works of art, and that they look better with the texture that time has given to most of the surfaces than they can have appeared in their pristine freshness. Mr. Walter Pater threw out the somewhat paradoxical suggestion that Michel Angelo left his marble figures unfinished in order to obtain the same sort of effect that he saw in time-worn antiques. The notion in itself is, of course, absurd, for the state in which so many of

Michel Angelo's works have come down to us is due partly to his own temperament and partly to the circumstances of his career; while he imparted at times the most exquisite finish to marble, as in the Pietà at Rome, or the torso of one of these very same unfinished works, the "Slave" of the Louvre. The notion, however, though in itself absurd, is very characteristic of "romantic" art criticism.

There is, indeed, not a little affectation in the modern worship of the undefined, and to this a right understanding of Hellenic work supplies a much-needed corrective. It is a first principle in the study of that work that it must be accepted as it was at the moment of its completion, absolutely clear in its definition and thorough in finish. The finish that the Greek craftsman put on his work is the secret of some of its finest qualities. It is precise and smooth, while it yet shuns the rigidity and lifelessness that some of the neo-classic styles in the modern world have taught us to know and to avoid. It is, however, only shapes that are perfect in their beauty and expressiveness that can bear the pitiless exposure which exact finish carries with it. If form be not really fine and studied in all its contours, then "sensitiveness of surface," "suggestion" and "texture" make a very pleasing and attractive substitute. But it is only a second-rate achievement to cheat the eye with a vague impression of the artistic in broken colour and light and shade. The Greek artist would have looked on this device with something of contempt, and we can imagine how Lucian's satire would have played about the work of the artistic genius who did not quite know his own mind.

Greek work, accordingly, may be taken or may be left alone, but in any case, the qualities by which it must be judged are those it possessed when it left the artist's hand, and not certain adventitious qualities it may have derived from the accidents of the centuries. Quite enough of this work has come down to us practically untouched for us to be able to judge how the work looked under the sun of Hellas. Though a good deal of the marble sculpture is corroded, of the bronze encrusted with patina, though the buildings have descended to us in a state of ruin, yet there are specimens or portions of each kind of work that are almost perfectly preserved, while smaller objects, such as coins, small bronzes, gems, gold ornaments, are sometimes as fresh as if they had just come from the workshop. No doubt there is an indescribable charm that may be given by "the mellowing touch of time"; and certain forms of Greek art, such as the terra-cotta statuettes, owe not a little to the broken tints, the dimpled surfaces of the age-worn material. These particular works were always, however, rather sketchy in style, and do not properly illustrate the point at issue. There are, on the other hand, many kinds of work in which we give no value to these accidental graces. A perfectly preserved Greek coin—and the world holds no more beautiful work of art—is always more admired by an artist than a coin to which time has added "texture," and the contours of a hydria are not improved when one of the handles is broken off.

What now is the true value to the modern artist of Greek work of this kind, frankly accepted in the Greek spirit?

The answer to this question in its broadest aspect is already conveyed by implication in the query itself. It is obvious that the answer must be, to a great extent, an expansion of the simple thesis that it is the spirit of Greek work rather than its outward features which will be found of real value to the modern practitioner. The classical orders have supplied, it is true, a repertory of ready-made details that have been usefully employed in Western European buildings from the time of the Renaissance downwards. The forms in question are, in themselves, arbitrary forms, meaningless to the modern intelligence, and their continued employment in modern work is by some strenuously opposed. The movement known as the New Art Movement, for which Scotland, to its pride or to its shame, seems to be in some part responsible, aims at substituting for these conventional forms other forms devised on each occasion by the constructing artist. These forms, whatever else may be said about them, are, at any cost, original, and it is claimed for them that they are more interesting than the time-honoured exemplars which, for three or four centuries since the Renaissance, each succeeding generation has tamely accepted from the last. So far as at present appears, the Classical Orders seem likely to hold their own; but it is quite an open question whether this is due to any inherent æsthetic virtues which they possess, or merely to the innate conservatism of the human mind. In other words, there may be a real, even a profound and cogent, artistic reason for the continued employment in certain kinds of work of classical forms; and if this reason can be made clear, then the forms are no longer dead forms, but living, in that they answer to the living needs of the present hour. On the other hand, the forms may be only retained as a mere matter of tradition, and if this be the truth, it may fairly be argued that they have become a sort of incubus on architectural practice, and by their deadening pressure flatten this into the academic.

The question here posed of the artistic value of the stock of material features handed down to us from the antique is only a

sub-question embraced within the larger inquiry formulated in the title to this paper. On the sub-question some words may be said later on, but it is well to begin by regarding the subject in its wider aspects, and to discuss rather the spirit of Greek work than the practical models which it supplies to the builder of to-day.

The spirit of Greek work can be best understood if we contrast the most characteristic artistic expression of the Hellenic mind, the Doric temple, with a monument that embodies as perfectly the opposite artistic tendencies which have been already referred to under the term "Romantic." The French cathedral of the thirteenth century shares with the Greek temple the distinction of representing the highest development of which architecture has shown itself capable. The two buildings are complementary to each other, each possessing characteristic qualities that the other lacks. Each is the expression of the ideal of an age.

The pedestalled isolation of the Classical fane, the clear-cut precision of its parts, where every ratio of size and place is studied, every profile matured with fastidious attention, are characteristically Hellenic; and by their own language these architectural features convey the central idea which in the moral life, in society and in the State the best of the Greeks were for ever striving to realise. Against this Hellenic definiteness and lucidity may be set the comparatively mystical temper of the Middle Ages, and the cluster of multitudinous details, that in picturesque illusive outlines enfold the thirteenth-century cathedral, are creations just as characteristic of the romance and enthusiasm of the North.

Much of the impressiveness of Mediæval buildings depends on the suggestion of mystery. Their interiors are amplified in effect by a disposition of the masses and the voids, which offers a "something beyond" in whatever direction we turn our eyes. Professor Freeman has remarked about the Gothic church:—"Place yourself where you will, the view is boundless, nothing occurs to force a limit on the eye in any direction; interminable rows of columns branch away to every point, arch is seen through arch, every feature suggests something beyond itself . . . even the apertures of the triforium and the narrow passages of the highest range give a hint of something yet further, of interminable mazes leading you know not whither."

Through this characteristic Mediæval buildings appeal to the imagination to an extent unparalleled in the more severely bounded classical structures, and they derive from this their special hold on our sympathies. Robert Louis Stevenson said somewhere that he liked a great cathedral; it was the form of mountain scenery that suited him best. This is a whimsical way of putting the important æsthetic truth that the forms of architecture have not a little in common with the grander aspects of natural scenery.

The effects of mass, of height, of vastness, the charm of complex detail, the mystery of light and shade we find on the one hand among the hills and forests, and on the other amid the towers and the aisles of our great Mediæval monuments. In both cases the æsthetic impression is largely due to varying effects of lighting. Shadow, which by its suggestion of the unseen increases apparent magnitude, is a potent element in the sublime effect of the masses of both nature and art. We are accustomed to study our great churches in the broad light of day, which fills their empty spaces and pitilessly exhibits to our view the fragmentary monument, the bare altar slab, the ruined shrine. Those who are fortunate enough to visit some of these immense interiors in the gloaming, or at night when they are only partially illumined, know how they gain in the half-light both in added vastness and in the suggestion of complex beauty in details that we cannot fully explore.

It is at such times that we can reproduce to ourselves the aspect that the church wore in Mediæval days better than in the full light of morning, or while the simplified modern rites are being performed at the rifled altar. The imagination then will readily travel back to the ages of faith and enthusiasm, when these colossal fanes were reared and embellished, with never-ending extensions of their spaces and ceaseless elaboration of fittings and enrichment. If placed alone at nightfall in an interior like Canterbury, or Lincoln, or Durham, the most pronounced classicist would surrender himself to the mystical suggestion of the scene, and recall the memories which the ancient walls enshrine. At such times we can fancy in the gathering darkness that there are altars and shrines along every aisle, and that every altar has a carved and painted canopy, each monument its screen of cut marble or of gilded iron. We see in imagination the last rays of the fading daylight enter subdued, but enriched, through the glowing windows, every pane of which is blue, or sanguine, or green, or gold. Anon the silver lamps and the iron cressets will be lit up, and we watch the faint radiance as it steals along the aisles, kisses the clustered pillars and dies away into darkness below the fretted vault. Next, the voices of the singers and the mellow notes of the wooden organ-pipes peal out for evening prayers; and then, still later, when all are gone, silence and gloom settle down upon the measureless spaces of

the interior. But it is not wholly dark nor all untenanted. There at the extreme eastern end a light is set within the window niche, that through the night its rays may make dimly visible to the watchers the costly treasures piled around some venerated tomb. In their chamber hard by sit the guardians of the shrine, and now and again the footsteps of other vigilant custodians of relic or of treasure wake the echoes of a distant chapel as they tend a lamp or make fast a door. The hours pass away, and there is a stir among these ghost-like denizens of the mysterious shadow-land, and soon from the central tower the deep notes of a muffled bell sound forth the nightly summons to prayer. Pendant lamps are lighted above the altar. One or two ministrants enter the church and pass on into the revestry to robe. Then along the vaulted aisle or from the southern transept, perhaps still half asleep or moving as if in dream, glide the dark-frocked monks or white-stoled canons to their office of vigil or of matin. The voices rise in the psalm and echo along the dim and cavern-like nave.

With this general impression in our minds of limitless complexity, of surroundings only partly apprehended, that offer from every side some fresh appeal to the imagination, let us contrast the opposite impression of absoluteness and lucidity which we receive from the severely bounded forms of the Greek architectural monument. For this purpose we must select a building as nearly as possible complete. A ruined temple like the Parthenon is of little help save for the study of details, because it has lost just that characteristic of absolute symmetry and evenness which is the quality with which we are for the moment concerned. The comparatively perfect temple beneath the Acropolis, the so-called Theseum, is on rather too small a scale when measured with the rock-like masses of the Parthenon overhead to produce a full architectural impression. A large temple, however, of an early period, roofless, but on the exterior otherwise well preserved, stands at Pæstum in Southern Italy, and this is happily the best known and most accessible of all extant examples. The great temple at Pæstum is so situated that one comes upon it suddenly after walking a few hundred yards from a bustling little railway station whither a crowded local train has transported us along five-and-twenty miles of hot and dusty railroad from Salerno. It bursts into view in a moment as we round the corner of a wall—a vast, clearly-defined mass, golden in the sunlight against the grey green vegetation of the plain and the blue of the distant promontory. Its platform rises shapely on every side from abundant tufts of the beautiful *Acanthus mollis*, from which is derived the leafage of the Corinthian capital, while in regular and continuous order the ponderous Doric shafts are ranged upon its topmost level, and bear above them the great horizontal incubus of the entablature. The brilliantly-illumined columns alternate with darkened interspaces, and in monotonous succession they follow each other in diminishing perspective along the receding face. Side corresponds exactly to side, end to end, and above the columns there is everywhere the horizontally bisected entablature, with the alternating triglyphs and metopes. The strong shadow cast by the projecting cornice and the gleaming strips of the corona crown the whole with an unbroken sky-line.

The impression is at first one of overpowering magnitude and the secret of this effect it would be interesting to trace. As a fact, the length of the building is much less than half that of the National Gallery in Trafalgar Square, yet no one ever received from the latter any impression of size. It is not, however, an impression of complexity, for the similarity of the alternating forms, by which we measure the bulk, forces itself on our attention, and we cannot escape obtaining from each of these forms a perfectly clear and definite impression, both in itself and in its relation to the other forms with which it is combined. The satisfaction which the eye receives, at first from the general mass and next from the forms in themselves, and in their relations, is so complete that we ask for nothing more. We do not realise, or at any rate do not lament that the building is absolutely plain, devoid of every touch of ornament, and of any colour save that of the actual material in which it is wrought.

There could be no more convincing refutation of Ruskin's famous paradox that the function of the architect is merely to supply a framework for the display of decoration in carving and colour. The artistic effect here is purely one of form, and the example supplies a potent argument in favour of those who contend that both architecture in its monumental aspects and sculpture are arts of form and of form alone. From the natural colour and texture of the materials employed they derive all the value that is possible, but, except in the interiors of buildings where other considerations come in, they do not ask to be painted. Architecture, moreover, again in its monumental aspects in exteriors, as an art of form, is independent of ornament. No one to whom Pæstum comes as a vision of power and beauty ever troubles about the untenanted pediment or the empty metope slabs. The austere plainness of the fabric only brings into clearer relief its inherent qualities of form and perfection.

For the secret of the effect of a fine monument of Grecian architecture is due first of all to the studied relations of form and size among a number of similar and often repeated parts.

Proportion, it need hardly be said, is the primal secret of the æsthetic effect of architecture, and no builders ever understood so well as the Greeks how to compass this effect by the simplest means. When the first overpowering impression of majestic repose we receive from a fine Greek monument has passed from the mind we find ourselves balancing part against part, the uprights against the horizontals, the architrave against the frieze, the triglyphs against the metopes, the height of the column against its thickness, and finding everywhere the most absolute satisfaction in relations which we feel could not be more harmoniously combined.

As mere forms, through their shape and size and relations, the parts of the Greek façade give this satisfaction to the eye and to the sense, but we receive a further impression, and one of a more complex and intellectual kind, when we note the clearness with which each of these parts proclaims its place and function in the organism of the whole. Furthermore, a closer study directed towards the features in themselves, apart from their relations, exhibits each form worked out to the minutest detail, so as to satisfy alike the eye by its contour and the intelligence by the fitness of its shape for the work it has to perform.

If we try to express now in a word some of the more practical benefits to a designer of a study of Greek work in this most monumental form, we may claim that it illustrates in the clearest and most convincing fashion some of the more important tectonic principles that apply to construction and decoration in general. Of tectonic principles Greek work is, indeed, the compendium. The Greeks are by no means always right, but their practice in these respects is more consistent and logical than that of any other artistic people. As a general rule they conceived with singular clearness the conditions of the artistic problems with which they had to deal, and were alert to seize and give effect to the suggestions of the material and the process which appeals so often in vain to the opinionated modern craftsman. But this expression "tectonic principles" must be further defined and illustrated.

(To be concluded.)

METHODS OF MOSAIC CONSTRUCTION.*

It is now more than sixty years ago since the revival in this country of mosaic as an architectural adjunct may be said to have begun. In 1840 Mr. Blashfield endeavoured to produce decorative pavements, and in this endeavour he was assisted by Mr. Minton and Messrs. Maw & Co., who succeeded in making excellent material for that purpose. Following Mr. Blashfield (and to a certain extent working in co-operation with him) came Sir Digby Wyatt, who, in 1848, published a work on the subject, and gave much practical assistance to the manufacturers who were engaged in producing the tesserae. Their efforts appear to have been mainly concentrated on the production of pavements geometrical in design, and made of such materials as asphalt, coloured cement and compressed china clay. The results obtained were so satisfactory that on the announcement of the intended exhibition of 1862, Messrs. Maw & Co. decided to move a step in advance of what had hitherto been done, and to produce a pictorial pavement in several colours. They therefore commissioned Sir Digby Wyatt to design a pavement of that character for them which they executed in tesserae of nearly a hundred different tints made by themselves, and as Sir Digby Wyatt states, "this was the first practical effort to revive pictorial mosaic amongst us."

Such was the position of the mosaic art in England in 1862. It shows that a certain interest in the art had been created, and this interest was stimulated by Sir Digby Wyatt, who in that year read a valuable and most interesting paper before the Royal Institute of British Architects on "Pictorial Mosaics as an Architectural Embellishment," dealing with the subject (as he himself states) from the point of view "from which we may best realise what architects have to learn and to do in order to effect a practical revival of the art at the present day," and with this aim in view he gave the main historical phases of pictorial mosaic, and dwelt upon the various scopes and difficulties of the art in its production and application.

Many artists and architects now gave serious attention to the revival of the art. The improvement in public taste, aided by an increased feeling for colour and decoration, gave encouragement to those who were interested in the revival, and it was not long before several eminent firms in this country succeeded in producing mosaics in enamel. The names of Messrs. Simpson & Sons, Messrs. Rust & Co., and Messrs. Harland, Fisher & Co. occur to me, as some of their full-

length figures are to be seen in the principal hall of the South Kensington Museum. But not until some years later were any important enamel mosaics executed in this country.

In Italy the traditions of the workers in mosaic had been handed down through centuries, and although the art had fallen low, it had never altogether died out. About the year 1860 a poor glassblower of Murano, named Lorenzo Radi, with the love of his art strong within him, made efforts to improve the manufacture of enamels, and especially of gold mosaic, and in his necessity he applied to a Venetian lawyer, Dr. Salviati, who found the means to enable him to continue his efforts in the production of the smalti (or enamel), by means of which Radi was endeavouring to revive the mosaic art in Venice. In a small way these efforts were successful, but for want of means and prestige they would have resulted in failure had not an artist of high merit and great social position extended to them a helping hand. I refer to the late Sir Austen Henry Layard—a man who was not only an artist in the highest and broadest sense of the term, but who was also a distinguished diplomatist and archæologist. From the moment he extended his protection to the revived industry, the success of that industry was assured. He, together with a few other English gentlemen, provided the necessary capital. The business which had been established by Radi and Salviati became their property, and was speedily merged into the concern which they then formed under the title of the "Venice and Murano Glass and Mosaic Company."

The first important commissions obtained by the company were the decoration of the Wolsey Chapel at Windsor and that of the Albert Memorial in Kensington Gardens. The general designs for both works were by Sir Gilbert Scott, and were carried out under his directions from the cartoons of Mr. John Clayton, of Messrs. Clayton & Bell.

About this time also were executed for the South Kensington Museum several full length figures from the designs of the late Lord Leighton, Sir Edward Poynter, P.R.A., Mr. Val Prinsep, R.A., and other distinguished artists.

In Westminster Abbey the "Last Supper," over the communion table, was executed from the design by Mr. Clayton; and in St. Paul's Cathedral two of the large spandrels under the great dome were covered with mosaics from cartoons by Mr. George Frederick Watts and the late Alfred Stevens.

From that time to the present day much excellent work has been done in various parts of the United Kingdom, in the Colonies and America by several well-known English firms of mosaists as well as by the Venetians, and the demand for mosaic decoration is steadily increasing. Of that there is no doubt; and the question of the hour is not whether mosaics should be executed, but how they should be executed so as to obtain the best results at the least possible cost. It is with a view to elucidating this question that I have prepared some notes on the methods of mosaic construction which I hope may be of interest, and may at the same time tend to remove misconception and prejudice.

Speaking broadly, there are two methods of construction:—

1. The old method, viz. that of fixing the tesserae on the wall directly and one by one.
2. The new method, whereby the mosaic is first executed on paper, and thence transferred to the wall.

The old method is simple enough; the wall destined to receive the mosaic is prepared with cement, the cartoon is outlined on the cement, and the mosaists, with the cartoon before them, proceed to place the tesserae on the wall one by one.

It is needless to say that under certain conditions the very finest mosaics can be—and even in recent times have been—produced by this method. The ancient mosaists, it would seem, invariably employed it, and probably no other process was known to them.

The first works executed in England by the Venetian mosaists were so executed, and the result was entirely successful, but it was soon made clear that unless some less expensive and more expeditious means could be devised for executing and fixing mosaics very little could be done to advance the art either in this country or elsewhere.

Anyone possessing a knowledge of mosaic art knows that it is futile to expect the production of a really good mosaic unless the work is carefully supervised by a properly qualified artist. Men no longer "work for the angels," and even the best workmen require the supervision of the master. Where the artist is designer and mosaist in one, as were so many of the ancient mosaists, and where time and money are secondary considerations, the principal disadvantages of this method disappear; but it is rarely indeed that such a fortuitous combination of circumstances is to be met with. The artist who by reason of his genius and reputation would be commissioned to design a scheme of mosaic decoration for some large cathedral or public building would probably not be a mosaist in the sense of possessing a close technical knowledge of the art, and if he were he could not be expected to overlook for several hours each day the workmen who are placing the tesserae on the wall. Even supposing it were possible to secure so con-

* A paper by Mr. W. L. H. Hamilton, read at the meeting of the Society of Arts on the 4th inst.

siderable a part of his time, the cost would necessarily be enormous. His designs and intentions have therefore to be carried out by another, who must be both artist and mosaist. Such men are not easy to find, and when it is remembered that any large firm of mosaists working by this method would require to retain on their staff many such artists, it will be seen that the difficulty presented is a very formidable one indeed.

Another difficulty which presents itself in the application of this method is the necessity of sending workmen from their homes to any part of the world where a mosaic is to be executed. In the first place it is difficult to get first-class workmen to leave their homes, and if this difficulty be overcome by increasing their remuneration, the necessary expenditure for travelling and maintenance adds largely to the cost of the mosaic.

Then, again, where the mosaists have to work on the spot, only a very limited number can work on the cartoon at the same time, and on such days and at such times as the condition of weather and light will permit, so that the work must necessarily proceed slowly.

These are difficulties which directly affect the cost of the mosaic. There are also difficulties which may, and in many cases do, affect the quality of the work. The conditions under which a mosaist working on the spot has to carry on his work are frequently well nigh insupportable. He is dependent on the climate of the country in which he finds himself, and even under the most favourable atmospheric conditions he must work in the imperfect light which comes to him through the shrouds and scaffolding by which he is surrounded: in winter he is chilled by the cold, and in summer he is half suffocated by the heat; he has to lie in all sorts of uncomfortable positions—sometimes on his side and sometimes on his back; and in spite of all these difficulties he is expected to exercise to their best his faculties and skill in reproducing not only the design but the exact colours of the cartoon which he is engaged in copying. What wonder if, under these circumstances, when the scaffolding and shrouds have been removed, the mosaic is discovered to be faulty and that some parts have to be demolished and begun all over again, or, worse still, the defects are permitted to remain because the expense of removing them would be too great?

There are in addition technical difficulties into which I need not enter. Those I have cited are sufficient to indicate the reason which led the mosaists who thirty-five years ago revived the art to the conclusion that unless some other process could be found little progress could be made either in this country or abroad.

When one remembers how much that is beautiful in mosaic art has been produced by means of this ancient method, it seems natural enough that it should have the affection, and even veneration, of many mosaists. To abandon it is to break with the past, and artistic sentiment is conservative, but

The old order changeth, yielding place to new,

and there are many indications leading to the conclusion that, except with reference to small works in which the designer is interested as mosaist, this venerable method will not survive the stress of modern conditions, and that the existing wave of opinion in its favour will, after a few costly experiments, subside.

In expressing this opinion, I do not forget the important work recently executed in the choir of St. Paul's Cathedral, but in that case the work was carried out under all the conditions necessary for the successful application of the method; there was no want of money, no limitation as to time, and the mosaists were under the direct control of Sir William Richmond, who designed the cartoons. It would be quite out of place here to criticise the result, but it would be interesting to know the cost, from first to last, of each square foot of mosaic executed, including the fees paid to the distinguished artist who superintended the work.

I now come to the new method. The Venetian mosaists having decided to abandon the application of the old method to the construction of decorative mosaics, adopted, developed and after many costly experiments brought to perfection the method which has become associated with their name, and which they have applied to nearly all the large decorative works executed by them during the past thirty years. This method, or process, was explained by the late Sir Austen Henry Layard in the following passage of a paper read by him at a meeting of the Royal Institute of British Architects:—

"The necessity of working on the spot is now avoided by an ingenious process which, however, is only applicable to decorative mosaic, and cannot be used when much delicacy of execution and extreme nicety in the gradation of tints are required. The workmen reverse the cartoon, and place the tesserae with their proper faces downwards. The tesserae are fastened with common paste to sheets of coarse brown paper, on which the cartoon is traced. When the work is finished it has only to be fixed with cement upon the wall destined to

receive it, and the brown paper is then removed from the face of it. This process requires considerable skill and practice, especially when figures have to be executed, but is perfectly successful. Thus the decoration of any number of square feet of surface can be forwarded from Venice to any part of the world—to America or to India—with safety and at little cost."

To go a little into detail; the studio should always be well lighted and well ventilated.

The workers are under the control of an artist who is also an experienced mosaist—indeed, his qualification for the post is that he possesses a large and varied experience in the practice of mosaic art.

The working mosaists are divided into grades or classes. The workers in the first grade work on those parts of a mosaic which require the most careful treatment, such as the faces, hands and feet of a figure; those in the second grade work on ornaments and drapery; those in the third grade have given to them the execution of simple backgrounds, and so on—each man being given that work which he is best fitted to perform.

When a cartoon is brought into the studio it is traced and reversed on coarse brown paper. This reversed tracing is then cut up into pieces of irregular shape, and these pieces are distributed among the various grades of workers. The cartoon is then hung up so that it may be seen by all, and the workers, being comfortably seated at their desks with a small anvil, small hammer, some paste and the enamels they will require on their side, the work begins. Each worker having carefully noted the colours and the size and shape of the tesserae required for his part of the cartoon proceeds to cut the enamels accordingly, and to place them with their proper faces downwards on to the plain tracing before him, and to attach them thereto with common paste.

With the exception of the tesserae used for metal backgrounds (to which I shall refer later on), each tessera is the same in colour throughout, and all the tesserae are of equal thickness, and are evenly shaped from top to bottom. When, therefore, they are placed on the paper "face downwards" there remains under the eye of the worker the exact counterpart of the work he has executed—the design being carried right through the tesserae—and he is thus able to judge of the effect of his work, and to make any necessary alterations or corrections as it proceeds.

Metal backgrounds sometimes require a slightly different treatment. Owing to the construction of "metal cakes," the metal is only visible from the front or face of the mosaic. As that the worker can see when he has placed the metal tesserae face downwards on the paper is the glass by which the metal is backed. In the case of a plain gold or silver background no modification of the method is necessary, as the worker, by long experience, knows exactly the effect which is being produced on the face of the mosaic. When, however, a background is to be composed of various shades of gold or gold and silver, a treatment requiring the exercise of great skill and judgment, it is constructed face upwards, so that the worker may see the effect of each tessera as it is laid; then paper is pasted over it, and it is ready to be packed.

On the screen I give an illustration—taken from a photograph—of the "wrong" side of a mosaic executed by this method. It will be of interest to those critics who have condemned the process on the ground that the worker cannot see the effect of his work as it proceeds, and it may be of some interest to others as being the first illustration of the "wrong" side of a mosaic which has ever been published.

In a very interesting paper contributed by Mr. Cleme Heaton to the Journal of the Royal Institute of British Architects, he states that he was told at Venice it was impossible to do figurework without grinding. I do not know from whom he obtained his information, but I can assure him that not one single tessera in this mosaic has touched the grinders.

The artist who controls the studio is in constant touch with all the workers, and in the course of his frequent visits to each one advises or corrects as he watches the progress of the work. It is he who divides the cartoon and distributes the pieces among the workmen, and in this connection it may be observed that sometimes a mosaic is required to be executed by a certain date much within the ordinary limit of time given to a work of the kind. It is impossible to hurry the workers, for that would be detrimental to the quality of the mosaic. The cartoon is therefore divided into smaller pieces than usual, and a large number of workers are employed on the work; and by this means, without hurry or injury, the mosaic is executed within the time allowed. Under the old method an expeditious treatment is not possible.

It may seem at first sight as though the employment of many workers on one design would produce inequalities in the workmanship which would mar the harmony of the work; but it must be borne in mind that the superintending artist controls the whole work and imposes his interpretation of the cartoon on all the workers. The slight variations in style

which he would permit would only tend to add an interest to the mosaic without in any way disturbing the harmonious blending of its parts.

Practical mosaists know well how difficult it is to avoid the intrusion of bits of enamel of the same colour, and possibly even from the same cake, which, when seen in a particular light or at a certain distance convey one tint, but in another light or at another distance convey a different tint; this may be due to some slight defect in the enamel, so slight as to be unobservable to the worker when placing the tesserae. Again, enamels which in one light appear to match exactly the colours of the cartoon, when seen in another light produce a different effect. Now here again we have an advantage over the older method, for the mosaic can be viewed at any angle of light while the work is in progress and before the tesserae are fixed on the wall; and any defective parts can be removed with ease and at little cost.

When all the tracings forming the cartoon have been covered with enamel they are collected and placed in a frame, so that the whole design now translated into glass comes before the artist and workers, and is again critically examined under various lights. In this final examination the artist has the assistance of all those who have been engaged on the work, an assistance which is of great value to him, for the eyes of the workers, trained by long experience in the practice of their art, are able to detect the least variations in colour, and the chances of a defective tessera escaping their notice are few indeed. When, therefore they and the artist agree that the colours of the mosaic correctly interpret the colours of the cartoon, and fulfil the conditions (if any) imposed by the designer, it is passed, packed and sent to its destination ready to be fixed.

In recent times there has been in certain quarters some disparaging at this method; but the only important objections—and important only by reason of their wide-spread acceptance—are two:—(1) That by this method the workmen are working in the dark, so to speak; cannot see what they are doing, and are unable therefore to correct their work as it proceeds. (2) That because the tesserae are placed face downwards on to the paper resting on a flat surface, the surface of the mosaic must necessarily be flat.

The first objection has been disposed of in the description of the process already given, and there remains nothing further to be added.

As regards the second objection, it is difficult to understand how the fallacy came to be propagated and accepted by many as an article of faith. Even the latest writer on mosaics, Mr. E. Baldry, in his charming book on "Mural Decorations," repeats it and condemns the method on that ground. Some months ago the Royal Institute of British Architects held a meeting to hear a paper read on the practice of pictorial mosaics, and the particular objection under consideration was stated, with considerable assurance, by the reader of the paper. Fortunately there was present at the meeting the eminent artist, Mr. Walter Crane, whose wide experience in every branch of decorative art had brought him into contact with mosaics executed by this method. He took exception to the statement, though seeming somewhat mystified by the assertion of his friends which contradicted his own experience. Referring to certain mosaics which had been executed from his cartoons by this method, he said:—

"He was very much astonished at the facility with which his designs were reproduced. . . . The tesserae were given the utmost exactitude, and the matching of the colours, allowing for difference in translation of the dead colour of the cartoon into the brilliant colours of the glass mosaic, was simply extraordinary; and even when designs were worked on his method he believed they had some method of giving a little push to the tesserae, in parts, to get more variation of effect in the gold of the background."

Mr. Walter Crane was right. The fact is, the placing of the tesserae face downwards on the paper does not in any way affect the surface quality of the mosaic, which is regulated at the time the tesserae are being fixed upon the wall.

When the mosaic is brought to the wall which is destined to receive it, the wall is prepared with cement, and the pieces on which the mosaic has been divided are taken from their frames and the work of fixing begins.

If one fixer only is working on a panel, about 4 feet of mosaic can be placed on the wall at a time. The tesserae are pressed into the cement, and after a few minutes the paper is stripped off and the mosaic discovered. It is at this stage that the character of the surface is determined. There is no need to hurry while the manipulation of the tesserae is proceeding, the cement used does not set firm for some hours after the paper has been removed, and there is no fear of the tesserae sagging, as they are laid from the bottom and not from the top in the old method. If, therefore, the designer is also a critical mosaist, and wishes personally to undertake the work of fixing, this method affords him facilities for stamping the work in its final stage with his individuality by giving to the

tesserae with his own hands that "little push" to which reference has already been made.

To facilitate fixing in localities where skilled fixers are not to be met with mosaics intended to cover flat surfaces are sometimes set in cement before they leave the studio. The process is as follows:—A bed of cement about $\frac{1}{2}$ inch thick is laid upon a smooth wooden surface, and before the cement has set an iron frame of ingenious construction (the invention of a Venetian) is pressed into it. This is then covered with an upper layer of cement prepared to receive the tesserae which are placed upon it in the same manner as, by this method, they are placed upon the wall. When the work is completed its appearance is that of a slab of marble, rimmed with iron and covered on one side with mosaics. It can then be placed in position by any competent mason, and for that reason this special construction is suitable for mosaics intended for India or the Colonies. The colossal figure of *Minerva* in the Library of Congress at Washington was so constructed, and the result is perfectly satisfactory. Large panels are divided into sections, to facilitate packing, and these sections (like the sections into which the cartoons are divided) are irregular in shape and follow the lines of the designs, so that when fitted together no joints are visible.

It must be distinctly understood that the "face downwards" method is applicable only to decorative work, and cannot be used (to quote Sir Henry Layard) when much delicacy of execution and extreme nicety in gradation of tints are required. In such cases the work is always executed "face upwards," and when finished is taken up on to paper from the front.

This, then, in brief, is the method which is now known as the Venetian method. For its successful application considerable skill and practice are necessary, but the experimental stage has been passed long ago, and experience has shown that the Venetians are capable of good work. They smile at the notion of a return to the older method, for they know that by the means they employ a mosaic of equal quality can be executed at half the cost and in less than half the time, and so they are content to allow the "battle of the methods" to be fought out in their absence, while they continue to raise higher and higher the standard of quality, being convinced that with the two masters, time and money, on their side their views will prevail.

In the course of this paper I have called the working mosaists "workers" or "workmen," but, in truth, those in the higher grades are entitled to be more suitably designated. They have studied every style of mosaic construction and thoroughly understand the possibilities as well as the limitations of the material with which they work. Their wide practical experience has given them freedom and assurance in shaping and placing the tesserae, and in adding all those subtle touches which mark the difference between a mere slavish copy of a design and a work of art. To make my meaning clearer, I will read a letter received from Cavaliere Giovanale, architect to His Eminence Cardinal Rampolla, on the completion of the mosaics recently executed for His Eminence, and now placed in the crypt of Sta Cecilia in Trastevere at Rome, and while doing so I shall ask my assistant to place on the screen one or two of the mosaics to which Signor Giovanale refers:—

"The mosaics are a perfect copy of the cartoons, reproducing with fidelity not only the outlines, but retaining in the treatment of light and shade, and in the expression of the faces, all the intentions of the artist who designed them, and truly interpreting the scheme of colouring expressed in the small sketches which accompanied the cartoons. Nor must I fail to express my admiration, and the admiration of those who have examined these mosaics, at the perfect technique and wise distribution of the tesserae by means of which all the most delicate effects of modelling and colouring have been obtained. This proves the artistic taste and technical skill of those who executed the work."

Men who can produce work of this kind are, I think, entitled to be called artists, and in this opinion I am supported by the late Sir Edward Burne-Jones, who addressed the following letter to the chief of some Venetian mosaists who had executed mosaics from his designs:—

"To the artists at Venice, who have been so indefatigable in carrying out my designs, I owe much gratitude, and I should be obliged to you if you would convey to those who executed the work some expression of my delight at the result of our co-operation and my trust that it is only a beginning of our labours together. Will you kindly do this for me, because I know their skill and workmanship have been of an unusual kind." Such words, addressed to them by such an authority, go far to establish the claim of the Venetians to be the best mosaists in the world.

The Liverpool Architectural Society will hold its fifth members' meeting at 13 Harrington Street on Monday next, the 16th inst., at 6 P.M., to hear a paper by Mr. I. P. Abercrombie. Subject, "Leonardo da Vinci." Illustrated by limelight views.

ARCHITECTURAL ASSOCIATION OF IRELAND.

A PAPER was read at a late meeting of the above Society by Mr. Crawford Smith on "Heraldry and Heraldic Ornament." Mr. F. G. Hicks, president, occupied the chair. The paper was illustrated with heraldic drawings and examples of heraldic tapestry, lent by Mr. Story, of London. Mr. Crawford Smith said the subject of his paper he thought was not much studied. That was doubtless largely due to local and historical circumstances. He regretted that, partly owing to these facts, he was unable to furnish many illustrations of his subject. Heraldry, he said, was the art of explaining by way of forms, symbols, badges and colours, the achievements of persons and families, individually and collectively, according to their various ranks of life. Such originally appertained to arms, trappings, liveries and robes of state and office, and by extension were employed pictorially, and in sculpture or stone, wood, parchment, &c., thus signifying in days when reading and writing were unknown to the general people the wearers' rank, station and history. Heraldry was, in fact, the hieroglyph of chivalry. As to its origin, some form of representation akin to heraldry was coeval with primitive man, but it was not raised to a science until comparatively recent ages. For the early inspiration of heraldry they should look for its origin in symbols adopted by personal taste, pride and convenience, as marks of honour, rank and position of state or family, but these implied no heraldic signification according to present canons. Crests of various designs and forms were to be found in Egyptian, Assyrian, Mexican and other sculptures, bas-reliefs and paintings. These, however, varied with the user, and except in a few instances could hardly be said to descend from father to son. A brief description of the terms used in heraldry was given, and Mr. Smith pointed to examples to be seen at Canterbury in connection with the armour of the Black Prince, and mentioned the coloured drawings in the British Museum of the ceremony of the entombment of Edward the Confessor. The historical mention of heraldry might begin with the period of the Norman Conquest, the general and regular use of heraldic device spreading about the end of the eleventh century. The beginning of the twelfth century marked the rise of the most brilliant heraldic period, which lasted through 300 years. The reader then dealt with the armorial windows in the great hall of Hampton Court Palace, and also with other historic buildings. He said it was to A. W. Pugin they owed most in this field of research, and about the finest monument of heraldic decoration of modern times, the Houses of Parliament, formed a fit memorial of his industry and genius. The lecturer then dealt with the arms and crests of sovereigns and nobles of England, and with the robes of the Garter, Bath, Thistle, &c., and in conclusion he urged the necessity for a thorough knowledge of the principles and practical application of the science in connection with architecture.

On the motion of Mr. Bradbury, seconded by Mr. Geoghegan, a vote of thanks to the lecturer was passed amid applause.

ACADEMY SCHOOLS.

IN the course of his lectures at the Royal Academy, Mr. Gilbert urged the students to disregard time spent in the schools in any other light than that of a novitiate, but to lay their studies to their hearts for future occasion. Next, he told his hearers, says the *Standard*, not to concern themselves at all about outside opinion, or that of their neighbours. He disavowed any combative intentions, for he had never had to complain of criticism against himself, but he had known artists abashed by "the person who had learnt to write, but never worked at all." He would have the students go ahead where their instincts led them, uninfluenced by expressed opinions, for so would they hand down their own ideals to posterity. He was trying to prevent their being ghosts of other folk, and he wanted them to recognise that they were not working in order to produce, but to gain knowledge for achievement in the future. For this there was no school—and he knew all—equal to their own, and if they regarded it as a training ground they would show fruit of that given them in seed. There was a time when he thought the training in these schools gave scope for alteration; but he was now convinced it was the best that could be had, for diversified teachers were less likely than personal ones to bring out imitators and mannerists, and it gave wider expression of various individualities. When he had at times drawn inferences between sculpture and painting, he was neither disloyal to his own branch of art nor wanting in respect for the other; but youthful aspirants in sculpture were apt to think they could do what they liked, and he would have them understand they could not. They were to reverence painting, but they had not canvas or colour, and instead of presenting one view as a painter did, the sculptor was a hewer of pictures which were to be seen all round, each

side being a complete picture and of varied outline, yet having relation to the front view. If this was not done a model was only a mud pie, with an attempt at a design on one side it. The one art was of tangible, the other of visual effect. Prinsep had shown that the painter was more restricted than the poet, as he had to take a particular moment for artistic purpose, whereas a poet could roam over a century, was a sculptor more restricted than a painter, for he had colour and his design could not be so all-embracing. He had just been round the adjoining galleries in the hope of getting inspiration for his address, as he was anxious to be one-sided, and the visit had more than ever decided him to speak to the students as a body who were not sculptors only. To do so would be an arduous task, as the temperament determined to conquer in a broad sense rather than a narrow one made them "artists" whether they were to be painters or sculptors. Later he showed how sculptors can learn from paintings, for he said Turner's picture, No. 12 at the Masters Exhibition, and Crome's "Mousehold Heath," were the best pictorial examples of what sculptors should go to. These two great pictures were pre-eminent, and should appeal to sculptors more than any others in the exhibition, for he never came across such pictorial representations of a sculptor's temperament. It was not the colour, the movement or the value of the pictures were placed upon the canvas, but because "you could go all round them." In the Turner work was on the starboard was as well realised as when it was on the port side of the ship. Painters might say this was not suggested, but as a sculptor he felt and he would tell the sculptor students it was the best example of how to venerate and use paintings. There was none to equal it except the Crome, which had marvellous solid extraordinary verification of fact, though there was no base; everything was elevated and beautiful. These pictures had no sordid realism of detail; they spoke of consummate thought and well-studied intention. It proved how highly he regarded the sister art that he fell upon those two fine paintings to accentuate his remarks on building up a sure foundation. There was no excuse for narrowness in practice or conception in a country like theirs, where every form of tradition from the Greeks onward could be studied. To obtain subjects, there was the source of their splendid art library, for they could create from suggestions derived from books, and if he had his way he would compel students to pass an hour a day in the library (and a test in literature), as a week there was worth a month in the schools.

Mr. Gilbert, in another lecture, said he would justify his assertions by stating why the teaching was so good, besides advising the students as to use of them. Casual visitors were better than a machine-planted teacher, for students could take the experience of men whose works they saw, and they were not hampered by dogmatic and didactic assertions of an individual. The schools were not a kindergarten; all the knowledge when they entered, and their studies were corrected by visitors, who were bent upon and bound to do the best. Possibly, if the students had the choice themselves, they could not find better men. There might be some fault, but in a body like theirs it took time to mend them, and he was absolutely convinced that the greatest fault of all was entirely their own. It lay in a lack of that *esprit de corps* which to a soldier meant everything, to be wounded was death to a sailor, and was of untold value to every calling. He said there was too much consideration of how to do the most work in the least time to win a prize for it. Pot-hunting in art led nowhere, and made only heroes of a moment not of hereafter. They should think that possibly the most unsuccessful man at prize-taking might become a great luminary. They should lean on one another, and to the elders he would say they were there both to learn and to teach. By elders he meant the advanced students, for there was practically no age limit to admission, and he knew by experience what a stimulus it was when the quasi-ancients gave help. The one who was able to launch out could say more to his fellows than hours of teaching would impart, and he was not sure this was not the best instruction they could have. There were always one or two much more advanced than the rest—pre-eminent in some degree—from whom such help should come. Much could be derived by contact with seniors, and it was but a forestall of what men and women get in after life by rubbing shoulders. Emulation he liked to see, but rivalry was hateful, and it was most terrible of all when it came between artists. They should fight for the glorification of their art and the upholding of the schools as superior to anything in Europe. This, too, would be remuneration of those who taught them, and whose judgment should be used, and they said should be taken in, and whose word should be obeyed, though the student's conceit might lead him to his own opinion first. They should remember Shakespeare's words, "Conceit in weakest bodies strongest works." He was as forcible as he could be, for he could not demonstrate

in art, and, indeed, he had come to the conclusion he knew nothing about it, after his more than thirty years' work; but his question of dealing with want of *esprit de corps* had been smoldering, almost boiling, in his mind for a long time. After vain eulogising the sculptural qualities in the Turner and some pictures referred to, Mr. Gilbert said he would refer to three others who were loyal to themselves, and who were represented in the neighbouring galleries, and all of whom, oddly enough, had at first given more time to sculpture than to painting—Vicat Cole, John Brett and Ridley Corbet. Corbet was a fellow student at the Academy, and Mr. Gilbert had watched him for years. He was thorough in all he did. He would sit for hours making drawings of every little detail of his pictures, hence his distant hill forms were such as were not found in the ordinary everyday smudge of a landscape. As a student, Corbet was older than most who were there, yet he looked on the juniors as juniors from whom he could learn something, and, when he was more proficient himself, and his then juniors were his inferiors, he was ready, in his turn, to give what advice he could. He was an example of what a student should be, never thinking of himself. Ego was not in his vocabulary. Vicat Cole gave scientific attention to durability of colour, but his private and personal predilection was for scientific inquiry for form, and he told Mr. Gilbert that the best clue to painting a tree was to dissect a leaf of it. Brett was a great realist, fearless in every way to what he did artistically, and he was a goldsmith, having much respect for his material. Then Mr. Gilbert said the members of the Academy were elder students, and their *esprit de corps* was evinced in many ways, and he added that affection and *esprit* were at the bottom of what he had spoken, but which they might seem like a sermon. He knew the why and therefore of shortcomings in art, and that it came about by an consideration of who shall have this or that statue. Finally, he conjured them to think more of becoming better artists than of making an ugly truth.

TESSERÆ.

Mason the Poet, and Sir William Chambers.

THE love of landscape gardening and of simplicity by Sir William Chambers, the poet, appeared in 1773, in a sprightly production, "An heroic Epistle to Sir William Chambers." A poet by descent, but born in Sweden, having come to England in his infancy, Chambers had risen by good fortune, enterprise, talent and the patronage of Lord Bute, from the supercargo of a Swedish vessel (in which he visited China) to the post of Royal Architect and Surveyor-General of the Board of Works to His Majesty. In this capacity he was engaged in laying out the royal gardens at Kew, in which he showed a striking regard for Mason's ideas of the picturesque. In a work published about the same time, he expatiated on the wonders of Oriental gardening as displayed in the imperial gardens of the Pasha of Minn Sven, near Pekin, and more than implied a contempt for the simple natural-imitating system, and no great respect for nature herself. Mason, whose temper was by no means free from suspicion and jealousy, perhaps thought that a poem in four books, called "The English Garden," was directed upon him, or he might think that to criticise the Court architect was a good method of satirising the Court, to which his politics were strongly opposed. The method he adopted to ridicule the Orientalist was simple and effectual. He just versified the most glaring paragraphs, and subjoined the original prose as a running commentary. Sir William Chambers, in his preface, wrote:—"Nature affords but few materials to work with. Plants, water and ground are her only productions, and though both the forms and arrangement of these may be varied to an incredible degree, they have but few striking varieties, the rest being of the nature of changes rung upon bells, which, though in reality different, still produce the same uniform kind of jingling, the variation being too minute to be readily perceived. Art can therefore supply the scantiness of nature. Our larger works are only a repetition of the smaller ones, like the honest chelors' feast, which consisted in nothing but a multiplication of his own dinner: three legs of mutton and turnips, three roasted geese and three buttered apple pies." Mason's opinion was:—

For what is nature? Ring her changes round;
Her three flat notes are water, plants and ground:
Prolong the peal, yet spite of all your clatter,
The tedious chime is still earth, plants and water.
So when some John his dull invention racks
To rival Boodle's dinners or Almack's,
Three uncouth legs of mutton shock our eyes,
Three roasted geese, three buttered apple pies.

Post-Alexandrian Sculpture.

In the various kingdoms which arose out of the conquests of Alexander the arts were more or less cultivated, and not

only were the great master-works of former times copied to adorn the new capitals, but new schools of artists sprang up in several of them. Alexandria, Pergamus and Seleucia rivalled each other in art no less than in literature. At Pergamus the celebrated groups were composed which represented the victories of Attalus and Eumenes over the Gauls. It is believed by some that the so-called dying gladiator at Rome is a statue of a Gaul, which originally belonged to one of these groups. Ephesus also had a flourishing school of art, which appears to have followed in the main the style of Lysippus, and excelled like that of Pergamus in the representation of battle scenes. The Borghese fighter in the Louvre is supposed to be the work of an Ephesian, Agasias, and to have originally formed a part of such a battle scene. In Syria too art flourished at Antiochia until the time of Antiochus IV., before whose reign a number of statues had already been carried away by Scipio. In these new monarchies statues of the gods were seldom made, and when they were executed they were in most cases copies from earlier works, as the character in which the gods were represented had gradually become fixed, and few artists ventured to alter the forms which had become typical. Portrait statues of kings increased, on the other hand, to a great extent. The vanity of the kings and the flattery of the artists created a new kind of statues: the princes were frequently identified with certain deities, and were consequently represented as such with all the requisite attributes. In many cases the mere bust of a king was put upon the body of a statue of a god. This was a most dangerous rock for artists; for the simple representation of a king in the shape of a god, which commenced as early as the time of Alexander, was soon thought an insufficient mark of veneration, and art degenerated into a mere instrument of the most vulgar flattery; pomp and show and tasteless ornaments were mistaken for art. Flattery towards the great was also shown in the monstrous number of statues that were erected to one and the same individual. Demetrius Phalereus had 360, or according to others 1,500 statues erected to him. When the honour of a statue ceased to be considered as a high distinction, and when it became necessary to produce such numbers of statues, the workmanship naturally became worse in proportion as the honour sank in public estimation. During this time it became customary to combine with the statues of kings and generals symbolical representations of towns.

Influence of Basilicas.

The basilican style seems at once to have revived the architecture of ancient Rome, and to have purged it from many of its corruptions. The original germ of Roman architecture differed totally and essentially from that of Greece. The one was founded upon the pier and arch, the other upon column and entablature. The high respect which the Romans entertained for the arts and literature of Greece led them from an early period to engraft her architecture, which had already been brought to perfection, upon the infant nucleus of their own—a union which corrupted the one and checked the development of the other, so that the architecture of pagan Rome can only be said to be really beautiful in those cases in which, as in the finest of her temples, the Grecian type was almost strictly followed, and in those great engineering works, such as the aqueducts, in which it was entirely excluded. It was reserved for Christian Rome to give scope and freedom to the original germ of Roman architecture by freeing it from the incongruous overlayings of Grecian art, so far at least as the principle of the column and the entablature can be considered its essential feature. The difference between the latest works of pagan and the earlier works of Christian Rome is strikingly expressed by the following detached passages from Mr. Hope:—"The architecture," he says, "of the heathen Romans, in its deterioration, followed so regular a course that that which most immediately preceded the conversion of its rulers to Christianity is also the worst," while the early Christian buildings, he says, "from their simplicity, the distinctness, the magnificence, the harmony of their component parts, have a grandeur which we seek in vain in the complicated architecture of modern churches."

Drawing and Painting.

Of the several branches or divisions of the painter's art, separately considered, design or drawing is undoubtedly the most important, for on drawing not only form, but action, expression, character, beauty, grace and greatness chiefly depend. Colour represents nothing, and lights and shadows have no meaning till they are circumscribed by form. Drawing is therefore evidently the foundation and first element of the art, without which all the others, ideal or practical, are not merely useless but nonentities. Hence it is clear that drawing must have existed before any other branch of painting, and that drawing must still have precedence in the order of acquirement, and hence we can be at no loss to account for the enthusiasm with which it has been spoken of, nor for the zeal with which the study of it has been enforced by all teachers of

the art. "He," says Sir Joshua Reynolds, "that is capable of delineating fine forms, even if he can do nothing more, is a great artist." And Annibale Carracci was wont to say to his scholars, "First make a good outline, and then (whatever you do in the middle) it must be a good picture." Many more expressions to the same effect and of equal authority might be quoted, but we have yet another proof, infinitely superior to the opinion of any individual, however exalted, of the supreme necessity and comprehensive utility of drawing; for in all the various schools and academies that have been instituted, in every place and country in which painting has obtained a local habitation, what has been invariably their object? Has it not been design alone? How little, if any, has been the attention bestowed on other branches of the art. If you ask them, "What is the first requisite in a painter?" will they not say, Drawing? "What the second?" Drawing. "What the third?" Drawing. They tell you, indeed, to acquire colouring, chiaroscuro and composition if you can, but they insist on your becoming draughtsmen. After this, to doubt the importance of drawing would be as absurd and arrogant as to doubt whether the institution of academies have in any degree contributed to the advancement of painting.

Brick Churches of North Italy.

The brickwork of North Italy may be studied in a large number of buildings in almost all the towns and cities in the valley of the Po, though at the same time other districts afford many remarkable examples. In Venice, Verona, Mantua, Piacenza, Cremona and Milan, and beside these in Pisa, Sienna, Lucca and Bologna, most of the Mediæval buildings are almost or altogether built of brick, and afford examples of almost every kind of use of the material, both by itself and in combination with stone and marble. Almost all the buildings display more or less sham construction. At Cremona there are examples of this in the transept fronts of the cathedral, where an enormous screen wall is carried up high above the roofs, and pierced with rose windows of elaborate character, but of no possible use. The east end of the church of San Fermo Maggiore at Verona is an instance of an apse treated in a similar way, each of its sides being surmounted by sham gables, the grouping of which, with the pinnacles between them, makes undoubtedly a most picturesque *tout ensemble*. The usual arrangement of the façades of these Italian churches is, however, fairly real and constructional. Buttresses of flat projection mark the internal divisions, and the real roof lines (always of flat pitch) are strongly marked by elaborate cornices of moulded brick. The buttresses are generally carried up to, and are also finished by, these cornices, and above them are frequently light pinnacles. San Francesco, Pavia, affords a fine example of this type, applied to a church consisting of nave and aisles. Here the buttresses are some of them moulded, and some covered with brick tracery, and all finished with delicate circular brick pinnacles. San Pantaleone, in the same city, is of the same type, but of five divisions in width, these divisions answering to the nave, aisles and chapels beyond the aisles inside. Of the treatment of the eastern ends of Italian churches those of Venice afford, perhaps, the finest examples. In that of Santa Maria Gloriosa dei Frari we have a central apse lighted by two tiers of windows, and a series of chapels on the east of the transepts, each with two windows on the same level as the lower tier of the central apse. The division between the two stages of the latter is strongly marked by a bold cornice, occupying the place which in England would be held by a simple moulded string-course; and this is one of the ever-recurring evidences of the fact that the Gothic architects of Italy never so thoroughly and entirely shook off the old Classic traditions as did those of our own country. Another class of fronts very often seen is that in which it has been intended to cover the whole with marble; and in these cases the walls are first of all built very roughly in brick, with courses projecting at intervals for the sake of affording bond to the marble. In the majority of cases the marble fronts have never been built above the base mouldings, so that these rough unfinished fronts are quite characteristic of the country. In the vast church of San Petronio, Bologna (which if it had been completed would have been the largest church in Europe), we have one of these west fronts, and in Sant' Anastasia, Verona, another. Both these churches are, on other grounds, worthy of admiration.

GENERAL.

The Society of Oil-Painters, Piccadilly, have elected the following members:—Messrs. L. R. Garrido, Moffat Lindner, Harrington Mann, A. T. Nowell and E. Borough Johnson.

Mr. George Cadbury has given 120 acres more to the Bourneville Village Trust. He states that now the Education Act has been passed the schools will be erected.

The Memorial to the late Bishop of St. Albans is to consist of a bishop's throne in the choir of the cathedral, together with the completion of the choir stalls.

The Annual Exhibition of the Royal Amateur Society will be held at Surrey House, Marble Arch, from March 19 to March 22 inclusive. A loan exhibition of miniatures will be held in connection with it.

Mr. Forsyth, the sculptor, has completed the memorial to General Sir Samuel Browne, V.C., which is to be placed in St. Paul's Cathedral. Mr. Forsyth is engaged upon a replica for Lahore Cathedral. The design of the memorial contains a figure in relief of a Punjab cavalryman, and was modelled from one of the men who came to England for the Coronation procession.

The Site of the Royal Infirmary in Manchester may be used for the erection of a free reference library and art galleries. A part of the land would also be required for the widening of streets.

The Liverpool Cathedral Committee completed the purchase on Monday last of the St. James's site from the Corporation. The conveyance was signed and the money paid by the treasurers. The question of site has therefore been determined in the most practical manner.

Sir Weetman Pearson, M.P., the contractor, and Lady Pearson are presenting an electrical organ to Worth parish church, Sussex, together with a valuable altar cloth, in commemoration of the coming of age of their son. This event takes place soon after Easter, by which time the organ, which will cost over 1,000*l.*, will have been erected.

The Cambridge University Library have issued a report on the Acton Library. They recommend that a general approval be given to the plans and specifications prepared by Mr. W. C. Marshall, architect, for making certain structural alterations in the rooms on the ground floor at the west end of Scott's Building, and for furnishing them with bookcases, and that the syndicate be authorised to carry out a portion of this work during the current year, subject to any modifications of detail which may appear to them advisable, at the estimate cost of 2,300*l.*

At the Northern Architectural Association's rooms, 36 Northumberland Street, Newcastle-upon-Tyne, the Royal Institute of British Architects' annual selection of prize drawings, together with the intermediate and final examination testimonies of study, will be on view on Monday next, February 16, from 3.0 till 4.30 P.M., and from 7.0 till 9.0 P.M.

The Marlow (Bucks) parish church tower and spire restoration fund has now been closed. The subscriptions, &c. amounted to 2,533*l.*, and the expenditure involved was 2,528*l.*

The Metropolitan Asylums Board have received a letter from the Local Government Board with reference to the expenditure incurred by the managers in connection with the Grove Hospital, and stating that the Board, having regard to all the circumstances, would not withhold their sanction to the expenditure and borrowing of 16,724*l.* in excess of the sum 255,116*l.* previously authorised.

Standing Orders have been complied with in the case of the Bristol, London and Southern Counties Railway Bill, which proposes to incorporate a company with 4,500,000*l.* capital and 1,500,000*l.* borrowing powers, to construct at an estimated cost of 4,929,166*l.* a series of railways eastwards from Bristol to Bath, with a total length of 75 miles, which, worked in connection with the lines of the London and South-Western, Midland Somerset and Dorset, and Dorset, Midland and South-Western Junction Railways, will provide an alternative route from Bristol and Bath to London.

The Building By-laws Association held their first general meeting last week, when the articles of association were adopted. The first of them provides that the objects of the Association shall be—(a) Where building by-laws and regulations are in force, to promote amendments so that official control of private buildings shall not extend beyond the demands of public health and safety, and thus to prevent encroachments on individual liberty; (b) where it is intended to adopt such by-laws or regulations, to secure that those adopted shall satisfy the above conditions; (c) to assist as far as possible in suitable cases those who may be unduly interfered with by building by-laws or regulations.

The Picturesque fourteenth-century church of Kislingbury, Northants, was formally opened by Bishop Mitchinson on the 2nd inst., after the completion of the first part of the restoration. A large scheme of restoration has been devised at an estimated cost of 1,000*l.*, and the first portion now completed was confined chiefly to the chancel, and cost 300*l.* An old pulpit and new priest stalls and choir stalls to match have been erected. The second scheme is estimated at 700*l.*, and this will include the reseating and reflooring of the church. The present old-fashioned square but picturesque pews will give place to modern seats. In addition, it is proposed to remove the disused western gallery, to place the handsome font in its proper position, and to restore an ancient piscina.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

ACTON.—Feb. 17.—Designs are invited for erection of public offices and a town hall. A fixed sum of 50*l.* will be paid to each selected competitor as a contribution towards the expense involved in the preparation of his design. Mr. Alex. Hemsley, clerk, 242 High Street, Acton.

BLACKPOOL.—April 14.—Designs are invited for a technical school to be erected in Blackpool at a cost not exceeding 15,000*l.* Premiums of 60*l.*, 25*l.* and 15*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

BRIDGWATER.—Feb. 28.—Plans, specifications and estimates are invited in competition for power and appliances to deal with the accumulations of silt in portions of the river Parrett. Mr. W. T. Baker, town clerk, King Square, Bridgewater.

CASTLEFORD, YORKS.—Mar. 31.—Designs are invited for free library. Premiums 15*l.* and 10*l.* respectively. Mr. H. I. Broadbent, clerk to Urban District Council, Town Hall, Castleford.

CHEPPING WYCOMBE.—March 4.—Designs are invited for the erection of a town hall and municipal buildings. Premiums of 100 guineas and 25 guineas will be awarded for the designs placed first and second respectively. Mr. T. J. Rushbrooke, borough surveyor, 77 Easton Street, Wycombe.

FENTON.—April 30.—Designs are invited for a public free library. Premiums of 60*l.* and 30*l.* are offered for the two selected designs. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

HULL.—March 15.—Designs in competition are invited for a memorial of the Hull soldiers who fell in the South African war. Mr. E. Laverack, town clerk, Town Hall, Hull.

HULL.—Mar. 31.—Designs in competition are invited for the extension of the town hall. Premiums of 300*l.*, 200*l.* and 100*l.* are offered. Mr. E. Laverack, town clerk, Town Hall, Hull.

MANCHESTER.—April 30.—Architects within a radius of thirty miles of Manchester are invited to submit competitive designs for an hospital to be erected in Quay Street, Manchester, at a cost not to exceed 14,000*l.* Premiums of 75*l.*, 50*l.* and 25*l.* respectively will be awarded. Mr. James Fildes hon. secretary, Quay Street, Manchester.

SUNDERLAND.—April 30.—Designs are invited for proposed alterations and additions to Victoria Hall, Sunderland. Premiums of 100*l.*, 50*l.* and 25*l.* will be awarded for the first, second and third designs respectively. Mr. F. M. Bowey, Town Hall, Sunderland.

SUTTON COLDFIELD.—Feb. 20.—Designs are invited for the erection of a town hall adjoining the council house, the total expenditure to be limited to 7,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. A. Clarry, C.E., borough surveyor, Council House, Sutton Coldfield.

WALES.—Feb. 27.—Plans and specifications are invited for an infant school at Ynysmudw, Pontardawe, Swansea Valley, to accommodate 250 infants. Mr. W. L. Evans, clerk, Gwauncaegurwen.

YEOVIL.—April 10.—Premiums of twenty and ten guineas respectively are offered for the two best schemes for laying-out a piece of land on which it is proposed to erect a town hall, municipal buildings, markets, &c. Particulars may be obtained from the Borough Surveyor, at the Town Hall.

WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

PRICE

5/- per foot super.

THE "CARLTON" PATENT NON-SLIPPING MANHOLE COVER.

THE "Carlton" is the name given to a new manhole cover which is being introduced by the Carlton Iron Foundry Company. It has been designed with a view to obviating the nuisance to borough surveyors and councils of having so frequently to renew the wood blocks in the roadway covers. As a glance at the sketch will show, in place of the wood blocks specially hardened metal blocks are inserted, and in order that there may be little or no concussion when struck by horses'

— Section of Manhole Cover —
— showing Metal Blocks. —

hoofs, a sheet of india-rubber is inserted between the metal blocks and the casting. They certainly should be more sanitary than wood blocks, and of course much more durable. To prevent the metal blocks from being tampered with they are fastened underneath with a special eye-bolt and pin, and while quite secure, they can be easily taken out if required.

NEW CATALOGUES.

MR. W. E. FARRER, of 36 Cannon Street, Birmingham (late Farrer, Barber & Co.), is sending out a new and very complete and up-to-date catalogue of sewerage ironwork and appliances. The sketches, of which there are over a hundred, are carefully drawn and admirably reproduced, and prices and all other necessary information are fully given. We may remind our readers that we had occasion to refer at some length to Mr. Farrer's sanitary specialties in our report of the recent Sanitary Congress at Manchester, where he was the recipient of several medals.

MESSRS. STONES & GUNBY, of South Yorkshire Brass Works, Rotherham, have sent us their new illustrated and priced catalogue of water, steam and gas fittings, cast-iron flushing cisterns, lavatory stands and baths. It is excellently and attractively got up and replete with information relating to the goods in question, the types of which are illustrated in great variety.

TRADE NOTES.

THE new model school, Queen's College, Cork, is being warmed and ventilated by means of Shorland's patent Manchester grates by Messrs. E. H. Shorland & Brother, of Manchester.

COMBE FLOREY rectory, near Taunton, has recently been fitted with the well-known "small tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, employing their latest improved economical coil-heater with waterway firebars.

THE Congregational body are going to erect a new illuminated striking clock in their church facing the Market Square, Reeth, near Richmond, Yorks, to celebrate the coronation of Their Majesties the King and Queen. Messrs. Wm. Potts & Son, clock manufacturers, of Leeds and Newcastle, have it in hand, to be completed by an early date.

THE Coronation celebration committee have just given an order to Messrs. John Smith & Sons, Midland Clock Works, Derby, for a large striking turret clock, which is to form at Colnbrook, near Windsor, a permanent memorial of the Coronation. The same firm made the large Diamond Jubilee tower clock at Maidenhead, and the Jubilee Memorial clock at Gravesend.

MESSRS. W. B. WILKINSON & CO., LTD., of 1 Victoria Street S.W., are at present laying their granite concrete pavings on the whole of the six floors of the Army and Navy Auxiliary Co-operative Society's new factory, Rochester Row, Westminster, under the instructions of Mr. John Darch, the Society's architect. The work is being done at a very rapid rate, about 1,000 yards per week.

THE tenders of the Columbian Fireproofing Company, Ltd., 37 King William Street, E.C., have been accepted for the fireproof floors at the new electric generating station in Beech Street, Barbican, for the Charing Cross and Strand Electricity Corporation, Ltd., Mr. W. E. Clifton, F.R.I.B.A., F.S.I., being the architect, and Messrs. Lawrance & Sons the builders; and for the fireproof roofs at the Metropolitan Cold Storage Company's premises in Charterhouse Street, E.C., of which the architect is Mr. C. Stanley Peach, F.R.I.B.A., and Messrs. L. Whitehead & Sons are the builders.

IDEAS IN COLOUR.

A BOOK of specimens of colour-printing, with the above title, has been issued by Messrs. Spottiswoode & Co., Ltd. In it there are examples which will suggest the various styles which have gained approval. Some designed by Mr. Tom Brown are remarkable for breadth of effect, which can be produced without many printings. In an opposite style is the elaborate copy of a painting by Mr. A. H. Tourrier. There are also plates which are most suggestive, although depending mainly on shadowing. As a contrast there are examples of detailed work, which many manufacturers prefer. Many of the plates would, for vigour of colour, hold their own beside oleographs. It is satisfactory to find so much good taste and inventive power employed in the service of trade, for in not one instance is there exaggeration or vulgarity.

THE first step in connection with the fitting with electricity of all naval establishments is being made with the naval asylum near Yarmouth, tenders having been invited for the electric lighting, &c., of this place. Following this will come extensive contracts for electric stations at all the dockyards. The estimated cost of the work is about 1,500,000*l.* sterling, and it is to be provided for under the Naval Works Vote, not by special vote or under the ordinary Navy estimates.

VALUATION OF OXFORD COLLEGES.

THE rating appeals have now been settled, and the result is shown in the following table. The first nine were settled by the Recorder, and the last two by agreement :—

College.	Rateable Values.			
	A. £	B. £	C. £	D. £
Keble	3,537	3,183	2,327	2,580
Magdalen	5,260	4,734	3,062	3,431
Balliol	2,997	2,698	2,273	2,443
Jesus	2,231	2,008	1,062	1,152
Queen's	3,346	3,011	2,262	2,312
St. John's	3,055	2,750	2,042	2,127
Trinity	2,685	2,417	2,017	2,167
Wadham	1,990	1,791	1,430	1,504
Worcester	2,210	1,990	1,497	1,627
New	5,240	4,716	3,379	3,516
Christ Church	9,390	8,452	6,366	6,795*
Totals	41,941	37,750	27,717	29,654

A. Valuation as made by surveyors to the assessment committee.

B. As reduced by the assessment committee on objection.

C. Messrs. W. Eve & Sons' valuation as given in evidence or in the last two cases submitted to respondents.

D. Decision of the Recorder or amount agreed.

* To this was added for the Christchurch Meadows and Merton Fields £457, making in all £7,252.

ELECTRIC NOTES.

THE capital expenditure on Paisley's electricity works amounts to over 100,000*l.*, and a recommendation is now being considered to expend an additional 42,000*l.* to extend the lighting system, make certain alterations and additions, and to provide a spare engine in connection with the tramway traction supply of current which will be required next year.

AT the Marylebone Borough Council's last meeting it was stated that the umpire had fixed the amount the Council was to pay for the acquisition of the undertaking of the Electric Light Company at 1,212,000*l.* The amount claimed by the company was roughly 3,000,000*l.*, while the Council's experts put the value of 600,000*l.* Sir E. Galsworthy stated that 50,000*l.* liability had been incurred in arbitration costs.

VARIETIES.

THE model village of Bourneville has been extended by a further gift from the founder of an estate of 120 acres. Mr. Cadbury made known his gift at the annual gathering of the villagers on Saturday, in the pavilion of the girls' recreation ground, Bourneville.

A NEW town hall was opened at East Ham on the 5th inst. The building, which stands at the corner of Barking Road and High Street South, is in the Renaissance style, and the facing are red-pressed bricks, with terra-cotta dressings by Messrs. Doulton & Co. A lofty clock tower is a striking external feature. The buildings are arranged in the shape of the letter L, and besides the council chamber, police courts, committee-rooms, offices, &c., there is a large public hall, where 1,200 people were present at the opening ceremony. The architects are Messrs. Cheers & Smith, of Twickenham and Blackburn respectively, whose design was selected in open competition.

THE Cheltenham Town Council sat in camera for a couple of hours on Monday considering the question of the town clerkship. Mr. E. T. Brydges, who has held the office for thirty-five years, has latterly had indifferent health, and the Council gave him six months' leave of absence, which will expire in March next. He is consequently at present on sick leave. The general purposes committee recommended that the town clerk should be granted a further six months' leave of absence on condition that at the expiration of that period Mr. Brydges resigned the office. An amendment was, however, carried, with one dissentient, in favour of giving an additional three months' leave only from March 1, upon the town clerk giving an undertaking to resign at the expiration of that period. Upon receipt of this undertaking steps will at once be taken to fill the office.

AT Sutton Coldfield on Wednesday the town hall and municipal offices, together with the caretaker's house in Mill Street, and some freehold and leasehold properties and building land situate in Holland Street, the Parade and Queen Street, were sold by auction. The municipal offices and caretaker's house were first offered. These have an area of 400 square yards. The bidding for this lot started at 1,200*l.* and reached 2,050*l.* It was knocked down at that sum. The town hall, the foundation-stone of which was laid on August 25, 1858, and which was erected at a cost of 4,400*l.*, was next submitted

And at Glasgow, Leeds, Birmingham, &c.

competition. This lot has an area of 800 square yards. The first bid for this lot was 2,000*l.*, and it was knocked down 2,100*l.* in less than five minutes, there being no further bid.

THE second of the series of lectures on the "Building of House," by Mr. A. Hunter Crawford, the president, was given last week to a meeting of the members of the Edinburgh Architectural Association, presided over by Mr. Charles A. Lockel. The paper described the method of building a house on the asphalted level, and was illustrated by black-board sketches of the proper building and bonding of stone walls. Details were given of the fitting in of the plumber-work, particular attention being directed to hot-water circulation. The framing of the timbers for the roofs, and the covering with tiles, was also detailed. Sketches were given of the joinerwork and plumberwork of the roofs. At the close of the lecture Mr. Hunter Crawford was awarded a vote of thanks.

THE inaugural dinner of the staff of Waygood & Otis, Ltd., the well-known lift and crane manufacturing business, was held on the 28th ult. at the Bridge House Hotel, London Bridge, E.C. Nearly 160 members were present, including the chairman and directors, the company's agents from all parts of Great Britain, and several of its representatives from the colonies and elsewhere abroad. In the course of the evening the managing directors, Messrs. H. C. Walker and R. Percy Mellon, dwelt upon the benefits, alike to the cause of British industry and the buying public, following upon the consolidation into a single organisation of the best British and American principles as previously represented by the separate Waygood and Otis companies, thus creating a strong and essentially British lift manufacturing undertaking, having its factories in London and Coventry. Other speeches followed, in the course of which the company's representatives in Great Britain and abroad spoke of the high reputation which both the Waygood and Otis lifts enjoy in all parts of the world.

It matters very little nowadays at what theatre a play is produced, so far as the question of stage furnishing is concerned, for, whether the piece be comedy or farce, tragedy or melodrama, much care is taken to insure that the various scenes shall be appropriately furnished. At the Adelphi and the Avenue Theatres, for example, the two new plays differ widely in character, "A Queen of Society" at the theatre in the Strand being vigorous melodrama, while "The Adoption of Archibald" is rollicking farce. But in both cases thought has

been bestowed on the scenic accessories, and whether it be the handsome salons of Mrs. John Brooke, sumptuous in gilt and brocade, or the comfortable rooms of the Coulters at the Avenue, cosy in oak and soft greens and drabs, good taste has been shown by Messrs. Oetzmann & Co, of Hampstead Road, N.W., who are responsible for the stage furniture in both productions.

BUILDING AND BUILDERS.

THE contract for sinking shafts on the site of the new dock for Swansea has been let to Messrs. Sir James Jackson, Ltd. This is the first step towards carrying out a gigantic undertaking, which involves an outlay of two millions sterling.

THE proposal to construct a bridge across Walney Channel at Barrow, at a cost of 124,000*l.*, has been before the general purposes committee of the Corporation of Barrow, but was referred back to the committee for further consideration, and it is probable Sir Benjamin Baker will be again approached with the view of his suggesting some less expensive scheme. Messrs. Vickers, Sons & Maxim have offered to pay one-third the annual loss on the bridge, which it is proposed shall be subject to a halfpenny toll.

MR. F. H. TULLOCH, Local Government Board inspector, held an inquiry at Cropthorne, near Pershore, as to an application by the Pershore District Council to borrow 2,500*l.* for works of sewerage and sewage disposal for Cropthorne. Mr. G. H. Fosbroke (medical officer of health) gave evidence as to the necessity of the scheme, and Mr. Raikes (Messrs. Willcox & Raikes) described the scheme, and said he was satisfied no other scheme was possible. Mr. C. F. Stratton, clerk of the Parish Council, and a large ratepayer, said a water scheme was wanted far more than a sewerage scheme, and the ratable value of the parish was not sufficient to allow them to undertake the two schemes. There was strong opposition to the scheme from the parish, chiefly on the ground of expense.

ON Saturday the chairman of the fire brigade committee of the London County Council (Mr. Allen) laid the foundation-stones of two new Metropolitan Fire Brigade stations, one at Vauxhall, on the Albert Embankment, and the other at Streatham. Second Officer Gamble and Superintendent

LISTS of ART PLATES and of
CATHEDRALS, published in THE ARCHITECT, sent
on application to GILBERT WOOD & CO. Ltd., Imperial
Buildings, Ludgate Circus, London,

Wangford represented the brigade. At Vauxhall a sub-station is to be erected, which will readily be extended should circumstances demand it. At Streatham, however, the new building, which will be almost opposite the existing duty-box, will constitute a full station. At the conclusion of the ceremony at the last-named place a vote of thanks was accorded Mr Allen, at the instance of the Mayor of Wandsworth, seconded by Alderman Welburne.

At a meeting of Galashiels Town Council a representation signed by 306 ratepayers was submitted, stating that they were of the opinion that before any further steps were taken in connection with the proposed extension of the municipal buildings, as shown by the plan adopted by the Corporation, estimated to cost over 4,000l., the ratepayers should have an opportunity of saying whether or not they were in favour of the proposed extension at this time, and requested that a plébiscite of the ratepayers be taken, and when that has been done, that the Corporation be guided entirely by the voice of the majority of their constituents. The requisition was allowed to lie on the table, on the understanding that before coming to any definite decision to proceed with the erection of buildings, a month's notice of motion be given.

FENTON SEWERAGE SCHEME.

COLONEL A. J. HEPPER, D.S.O., R.E., inspector of the Local Government Board, held a public inquiry at Fenton, Staffs, into a petition presented by the Urban District Council to the Board to issue a provisional order to empower the Council to put in force, with reference to certain lands required by them for purposes of sewage disposal and street improvement, the powers of the Land Clauses Acts with respect to the purchase or taking of lands otherwise than by agreement. Mr. Parfit (instructed by Mr. R. T. Adderley, clerk) represented the Urban District Council, and there were present the chairman (Mr. J. S. Goddard), and various members of the Council; Dr. G. Reid, county medical officer; Mr. J. E. Willcox, C.E., Birmingham, and others. It was stated that in March 1882 the Council obtained upon a thirty years' lease over 140 acres of land at an annual rental of 790l., on which to treat the sewage by broad irrigation. The demands upon the sewage farm largely increased, and in March last an action was brought against the Council by the Attorney-General and the Duke of Sutherland for polluting by the effluent from their

sewage works two brooks which flowed into the Trent. The Council then called in Mr. Willcox to advise them in the matter, and he recommended that the only effective way of dealing with the sewage of the district was by the bacteria treatment. The Council adopted this advice, and some seven separate sites for the new works were considered, and a piece of land about 18 acres in extent was selected as the most suitable for the purpose. There was difficulty in acquiring this land by agreement, and it had been found impossible to acquire any other suitable site at a reasonable cost. The present sewage scheme involved an expenditure of between 600l. and 700l. a year in pumping, but to the proposed site of the new works nearly the whole of the sewage of the district would flow by gravitation, thus saving about 550l. a year in the cost of pumping. There would also be a great saving in the cost of working the farm when the bacteria treatment was substituted for that of broad irrigation, besides saving the rent of a large area of land when the lease of the present sewage farm expired in 1912. The cost of the proposed new works, roughly estimated, was 18,000l. Assuming that this was raised on a thirty years' loan, the annual repayment of capital and interest would be 978l., from which must be deducted 550l. the saving effected in the present cost of pumping. Mr. S. A. Goodall, surveyor of the Council, and Mr. Willcox having given evidence in support of the scheme, Dr. Reid supported the application on behalf of the County Council.

THE PREVENTION OF FIRE.

THE subjoined letter from Messrs. Merryweather & Sons, Ltd. has been printed in the *Times* :—

Statements emanating from Berlin have been circulated in the Press to the effect that, although English steam fire-engines cannot be surpassed, we are behind in regard to chemical engines and long ladders, which, it is alleged, cannot be obtained in this country. The Germans and Americans therefore are to come over and supply the deficiency.

We hope we need not apologise for troubling you to contradict the assertion. The manner in which the British industry with which we are chiefly concerned and also other British industries are persistently misrepresented in our Press for the benefit of foreign competitors is a national and not a personal affair, especially in view of the state of trade in the country generally.

WHAT WE SAY

VELURE

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary—washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer.

Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,

13, CLERKENWELL ROAD, LONDON, E.C.

WORTH

One Gallon will
Cover about 90
Square Yards.

TRYING.

FINISHED LIKE A MIRROR.

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRIAN, Yacht Builder.
Nunnsquarter, Kirkcubbin, Co. Down, June 24, 1901.

BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.

WHAT CUSTOMERS SAY

H.M. THE KING.

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.

11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.

Meadow Grange, Blean, near Canterbury, Jan. 2, 1902.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST,

Telegrams, "CHALLOR, LONDON."

It should be remembered that the reason for these misrepresentations is purely a commercial one. The British public should be informed as to the real facts of the case. They need to go abroad for any of their requirements in the direction indicated. Although the British manufacturer is hampered by excessive tariffs, he holds his own throughout the whole world against foreign competitors in this particular branch of industry. He makes the precise appliances in point. Although it is implied that long ladders and chemical engines cannot be obtained in England, the following are now in construction at our factory, and we do not believe there is any other firm, either in America or Germany, which can show so great a variety of apparatus of different kinds.

(1) A combined telescopic fire-escape and fire brigade tender, the escape arranged for a height of 80 feet. (2) A combined chemical fire-engine with four-wheeled hose tender and telescopic escape to reach 50 feet. (3) A combined chemical fire-engine with four-wheeled hose tender of a different pattern and a 60-feet escape. (4) A number of motor fire-engines of different capacities. (5) Automobile combined chemical engine, fire-escape and hose tender. (6) A combined fire brigade tender, chemical engine and ladder carriage. (7) A combined double cylinder chemical fire-engine, fire-escape and hose tender. (8) Automobile hose carriage signed for fire brigade and other municipal purposes. (9) Automobile motor carriage for another fire brigade for some similar purposes. (10) An automobile hose reel and fire-engine tender.

The whole of the above are our own new designs for actual customers.

DUNFERMLINE COTTAGE HOSPITAL EXTENSIONS.

The managers of the Dunfermline Cottage Hospital having resolved to carry out a much-needed extension, the architects the hospital, Messrs. Sydney Mitchell & Wilson, 13 Young Street, Edinburgh, were consulted and various sketch plans were prepared which were carefully considered by the managers. The plan was finally adopted, and is estimated to cost about 3,000/. It consists of large additions to the east and west wings of the hospital, and a rearrangement of the male and female wards, so that the west division is now entirely devoted to male and the east division to female patients. The present west male ward

is to be extended to accommodate eighteen additional beds, making twenty-four in all, with the necessary additional lavatory accommodation. A ward kitchen is provided by cutting off a part of the present out-patients' room, that room being extended northwards to the same size as at present. This wing has a high platform roof, in which thirteen excellent nurses' rooms are provided, with bath and lavatory accommodation and storeroom for boxes. On account of the rapid fall of the ground at this end of the hospital building, there is ample height under the ward for a basement floor. This has been utilised in providing rooms for the Röntgen rays, a servants' hall and a house for the porter. The east, or female wing, is to be extended to give accommodation for six additional beds. The present east men's ward of six beds is to have a new entrance from the female side, and will be added to the accommodation for females, while a three-bed female ward is given up as a convalescent-room, which was much needed. The total number of beds in the female wards will now be twenty-one, all with ample room and no crowding of floor space. The exterior of the new buildings is treated in a simple but neat and inexpensive manner, and in harmony with the present hospital. A new access gateway to the grounds is to be formed from Reid Street.

BRITISH FORESTRY.

IN February 1902 Mr. Hanbury, as president of the Board of Agriculture, appointed a committee to inquire into and report as to the present position and future prospects of forestry, and the planting and management of woodlands in Great Britain and to consider whether any measures might with advantage be taken, either by the provision of further educational facilities or otherwise, for their promotion and encouragement. The committee consisted of Mr. Munro Ferguson, M.P., chairman; Sir John Rolleston, M.P.; Mr. E. S. Howard, C.B., Commissioner of His Majesty's Woods, Forests and Land Revenues; Professor W. Schlich, Professor of Forestry, Royal Indian Engineering College, Coopers Hill; Colonel Frederick Bailey, R.E., Lecturer on Forestry, Edinburgh University; Professor J. R. Campbell, Assistant Secretary to the Department of Agriculture and Technical Education for Ireland; Mr. Herbert Lewis, M.P.; Mr. G. Marshall, of Godalming; and Dr. W. Somerville, assistant secretary to the Board of Agriculture. Mr. R. H. Hooker was secretary.

ADDRESS—

4 & 5 Great Turnstile, Holborn, London, W.C.

GOLD MEDAL, Inventions Exhibition, 1885.
Telegrams, "Turnstile London." Telephone No 188 Holbor

After hearing witnesses and considering the information available, the committee endorse the conclusions of the Select Committee of the House of Commons of 1885-87 as regards the neglected condition of forestry in Great Britain, the possibility of improvement, and the necessity for the provision of better means of education.

The inquiry starts very much at the same point as did that of the Select Committee in 1885. Although efforts have since been made to adopt methodical treatment, and a wider appreciation of the advantages of close canopy, clean timber and heavy crops is discernible, yet, on the whole, there has probably been a further reduction of the already inadequate stock of timber in the wooded area.

It is shown on the highest authority that there is in these islands a very large area of waste, heather and rough pasture or land out of cultivation, amounting in all to 21,000,000 acres, on a large proportion of which afforestation could be profitably undertaken. Regular forest book-keeping is rare in Great Britain; but the various estimates of profit obtained from the cultivation of timber, which have been laid before both inquiries, are found to be substantially correct. Excellent returns, even with indifferent management, have often been obtained from plantations formed on land of little or no value for any other purpose.

The importance of afforestation in such a district as the Highlands of Scotland will be readily grasped. Rough land is extensive, capital as a rule scarce, and great woodland areas, where well-managed, have proved financially successful, while profits on sheep farming have of late years reached a very low point. Land under forests would give healthy employment to a much greater number of persons than the same area under sheep.

Experts of high authority have recorded the opinion already expressed in many reliable publications, that the world is rapidly approaching a shortage, if not actual dearth, in its supply of coniferous timber, which constitutes between 80 and 90 per cent. of the total British timber imports. The great area of waste land in these islands, which might be afforested, and with regard to which such valuable evidence has been led, thus becomes a matter of grave national concern. No individual effort is likely to cope with such extensive afforestation, not only because British forestry, as now practised, is inefficient, but because of the capital required, the time during which it remains sunk before producing income, and the lack of all security on private estates for continuous good management

from the time that the forest is formed until matured timber is placed upon the market.

The present condition of existing woodlands has been repeatedly and clearly reviewed by many eminent authorities. It is the common verdict that timber of the kind and quality imported in such large quantities from the Baltic and similar temperate regions can be grown as well here as anywhere; in fact, it is a matter of common knowledge that European "red wood" and "white wood," so highly esteemed for structural purposes, are yielded by the Scots pine and the spruce, two of the commonest trees of British woodlands. That foreign is generally preferred to home-grown timber is in no way due to unsuitability of soil or climate, but is entirely due to our neglect of silvicultural principles. It is hardly too much to say that until within the last ten years or so owners of woodlands, with few exceptions, failed to realise that the shape, size and quality of trees could be influenced by anything that they could do. They seemed to imagine that the character of the final product was largely a matter of accident, whereas it is mainly determined by management. They failed to recognise that cultural treatment which suits oak or ash is unsuited to pine or spruce; and so it has come to pass that British coniferous timber has been generally excluded by architects from building specifications. As another instance of this we may refer to the statements supplied by the Post Office as to the unsuitability of home-grown pine for telegraph poles.

That the yield of our woodlands can be materially improved admits of no doubt, and the evidence before us unanimously favours immediate and effective provision for bringing systematised instruction within the reach of owners, agents, foresters and woodmen. This has been on all sides emphasised as the first requisite in any project for the improvement of forestry, and consequently stands out as the cardinal point of the recommendations of the committee.

For effective instruction, however, a large area of woodland for purposes of practical demonstration is an absolute necessity. Professional equally with scientific witnesses pressed for instruction or demonstration areas, under State or corporate control, so as to secure that continuity of management without which a sustained annual yield and a maximum return is impossible.

Such areas, properly organised, would afford as striking an object lesson as any to be found within the sphere of technical education; every proved and appropriate method for the economical and effective management of woodlands and the

utilisation of forest products would be employed under competent direction. But to be of the highest value such forests must not only exemplify definite sylvicultural systems; they must also be managed as commercial undertakings, so as to produce the best financial results.

It is necessary to have "example plots" in connection with the universities and other centres of instruction, as well as two large State demonstration areas; and it may be well here to explain why both are required. The example plots should embrace a comparatively small area, and comprise an arboretum or collection of specimen trees, and also an area devoted to the experimental planting and growth of trees in masses up to a certain age.

Two such demonstration areas—one in England and one in Scotland—are at present required. In order to provide suitable centres for fully demonstrating the principles of forestry, these areas should be large, preferably from 2,000 to 10,000 acres; and should include within their boundaries as great a variety of soil, aspect, altitude, &c., as possible, so that they may afford practical illustrations of the proper management of forests under all sorts of conditions.

In England, with its Crown forests, an instruction area could be readily made available with the consent of the State and the co-operation of the Commissioners of Woods and Forests. In Scotland, where the amount of land remaining vested in the Crown is small, an area should be bought, and it would not be unreasonable to ask the State to reinvest in land to the extent of, say, 50,000.

The Alice Holt Woods in Hampshire could be readily brought into good working order, and could be made to serve as a useful object lesson at an earlier date than any of the other woods belonging to the Crown; and it is recommended that they should be made available as soon as possible to serve as a demonstration area. As regards a locality in Scotland, the committee are not at present in a position to make any specific recommendation.

Facilities for imparting sound knowledge of the elements of forestry should be provided at the various colleges supplying instruction in agriculture in Great Britain. Inasmuch as land agents are entrusted with the management of large estates, which usually comprise a certain area under wood, it is clearly requisite that they should know how to turn that area, as well as the land under other crops, to the best account.

For working foresters or woodmen, whose prospective salaries do not at present justify their attending for any length

of time at the universities or colleges, a practical training in the woods naturally forms the best basis of instruction, and for this the State demonstration areas already recommended offer the most suitable medium. It is recommended that student foresters be taken on as employes in receipt of regular wages, and that classes be held which they should be required to attend.

In order to provide for the instruction to be given in these demonstration forests, the committee suggest that the State should equip each of them with buildings, which would offer accommodation for a director and his assistant, and, if necessary, for ten to twenty student-foresters. It is not anticipated that the cost of the buildings would exceed 5,000*l.* to 7,500*l.* in each forest.

Evidence has been laid before the committee to the effect that in England the incidence of rates on plantations, and the valuation of woodlands made by assessment committees, are subjects of complaint.

Claims are also made upon timber merchants and others by local authorities on account of "extraordinary traffic," it being alleged that the heavy weight of timber damages the roadway; and it has been represented that such claims hamper the industry. The committee are of opinion that these claims are unreasonable, more especially in view of the fact that woodlands, by paying rates during the many years when they are yielding nothing, and when no timber is therefore moved along the roads, have contributed to the maintenance of these roads, from which they derive no benefit until the crop is brought to market.

Three systems of levying the Estate Duty on woodlands have already been tried since the introduction of the Finance Act, 1894, and that now in force is peculiarly unfair to the poorer districts. An estate in the comparatively rich lands of Devonshire, for example, might escape a Death Duty upon timber which one in Argyllshire might have to bear to the extent of a fourth of the whole duty raised. Moreover, the pressure of such a Death Duty on timber must both act as a bar to afforestation in districts most needing it, and compel the realisation of immature timber, thus preventing the practice of sound forestry. This irregularity in the incidence of the duties needs immediate revision.

Some adequate security against the raising of fires by sparks from railway engines seems equally feasible and desirable. Inasmuch as a Bill dealing with this question, introduced during the last session, has already received sup-

port, it is not necessary to dwell further upon this subject than to urge the desirability of some such Bill becoming law at the earliest opportunity.

The presence of ground game is ruinous to systematic forestry and to sylviculture by natural regeneration. In the public interest, the owner of plantations who himself keeps down ground game should have the right to recover compensation for damage caused by hares and rabbits from adjoining property.

Valuable evidence as to the work undertaken by the Corporation of Liverpool to afforest the catchment area, around Lake Vyrnwy, of the water supply of that city was received, and some other municipalities have also had similar schemes placed before them. The committee are of opinion that this is a direction in which a considerable amount of afforestation may usefully be done. To prevent all risk of contamination of the water supply, it is at the present day the policy to remove, as far as possible, all human habitations and farm buildings, as well as live stock, from such areas. These areas, therefore, however well suited they may otherwise be for the production of crops or the maintenance of live stock, are practically derelict, and yield no return beyond that obtained from the sale of the water, upon what is usually a very heavy capital expenditure on the part of the Corporation. The committee desire therefore to draw the attention of corporations to the advantages and profits to be derived from planting their catchment areas with trees, which ultimately will not only contribute materially to the retention of the rain that falls over the area, and thus assist in regulating the water-supply and in preventing floods and water-famines, but will tend to the purification of the water, and should also, properly managed, yield a fair and regular income on the capital expended. Such catchment areas, if they are to be thus utilised, should be placed under the control of a competent forester. And inasmuch as they will be under corporate control, and less subject to changes of management than land owned by private individuals, there is no reason why they should not also ultimately serve as demonstration forests and be available for the instruction of students. For example, the catchment areas of the Liverpool and Birmingham Corporation Waterworks, situated in Wales, within reach of university colleges possessing agricultural departments, could, with the consent of the corporations concerned, be used for these purposes.

In conclusion the committee offer the following recommendations:—

(a) That two areas for practical demonstration be acquired, the one in England and the other in Scotland, of not less than 2,000 acres, if possible, nor over 10,000 acres in each case. We suggest that the Alice Holt Woods in Hampshire be made available as soon as possible to serve as a demonstration area in England, and that a suitable estate be purchased in Scotland, as convenient as possible to Edinburgh, for the same purpose. These recommendations would have to be carried out by arrangement between the Commissioners of Woods and Forests and the Board of Agriculture; and assistance should be looked for from local authorities, societies and individuals interested in forestry and technical education.

(b) That additional facilities for instruction be afforded, by the appointment of a lecturer on forestry in connection with each of the Universities of Cambridge and Oxford, and that example plots (the German *Forstgarten*) be provided in connection with each of these centres and with Edinburgh.

(c) That a good grounding in forestry form an integral part of the curriculum of the colleges providing instruction in agriculture in Great Britain; and that short courses of instruction suitable for the requirements of young foresters be also provided there. Instructors should also be available for giving practical advice in connection with the management of woods, the owners of which desire an expert's opinion.

(d) That provision be made for the education of foresters and woodmen by employing students to work in both the demonstration forests, and that suitable buildings be erected on the ground for the instruction, and where necessary for the accommodation, of these student-foresters.

(e) That lectures be given, under the auspices of the county councils, in neighbourhoods where there is a considerable area under wood, and that scholarships be offered in such counties to enable working foresters to attend courses of lectures.

(f) That the inequality shown to exist in the levy of the estate duty on timber be redressed.

(g) That the Government be urged to secure the early enactment of a Bill to protect owners of woods against loss by fire caused by sparks from locomotives.

(h) That the inquiry conducted in 1895 concerning the area of woodlands be repeated by the Board of Agriculture, and that details concerning the character of the timber crop grown upon them be ascertained.

(i) That the attention of corporations and municipalities be drawn to the desirability of planting with trees the catchment areas of their water supply.

THE WEEK.

WE have given abstracts of so many conflicting official reports relating to the fall of the Campanile at Venice, it may seem to be an increase of confusion to refer to another of them. The Italian Royal Commission is, however, entitled to respect, and it is possible the report, coming so long after the others, may be expressive of a judgment that was not disturbed by the emotions which arose at the time of the catastrophe. The lower part of the structure is still standing, and it has sustained the investigations of experts. The commissioners conclude that a report prepared as far back as 1549 was not exaggerated when it said that the foundations are capable of sustaining a much greater weight. It is likely that the commission by endorsing that judgment have gone too far. The fall of the Campanile was immediately due to weakness, which occurred by tampering with the walls at the level of the roof of the loggetta. But it does not follow that the whole of the parts still standing are perfect and that it would be a wise policy to raise the new Campanile on such a sub-structure. The walls which succumbed, as they were constructed at different times, exemplify different theories of building science. The oldest part testifies it was formerly considered that lime with scarcely a trace of sand could serve as mortar. In 1500 there was more skill, and sand and cement were both employed. The walls were therefore not homogeneous, and must have resisted winds and rain as well as time in various degrees. The loads were not equably disposed. The inner walls not only bore a greater weight than was contemplated at first, but to some extent they had to serve as props to the outer walls. This may seem incredible, but it is vouched for by the members of the commission. If the upper part had been thoroughly united, the removal of the stones from which the rain fell on the loggetta might have succeeded, especially if the operation was performed gradually, but when all above was heterogeneous the clearing out of the mortar from any one course was almost sufficient to bring about destruction. As to the responsibility for the collapse, the commissioners seem to think that all those different departments who had a share in the conservation of the monument must be considered culpable. Those who are supposed to have constantly scrutinised its construction should have known of its weakness, and those who commenced to make incisions to preserve the roof of the loggetta should have endeavoured to know the facts of the case. The immediate cause was having too many officials, and it is very possible the remote causes arose in the same way.

It is a common belief that contractors have a right to old materials standing on any site of operations, unless it is expressly set forth in the conditions of contract that they are to be reserved. As a rule, building owners are anxious to have the ground cleared and new buildings erected as quickly as possible; consequently there is no demurring to a general removal of everything which can come under the comprehensive title of old materials. Of late years, an exception is made not only in digging foundations for buildings, but in railway excavations, sewer works, pipe laying, &c., that objects of archaeological or geological interest shall be preserved and handed over to the architect, engineer or surveyor in charge. It does not always follow that the clause is observed by the workmen, although in some instances it is to be feared that a great many sham antiques are disposed of whenever there are works on a large scale. The custom has been so long tolerated of a builder's claiming possession of old materials in general, it has almost assumed the power of law—at least, builders think so. A case was heard in the Alton County Court a few days ago before Judge GYE which suggests the uncertainty there is on the subject. A lady sued for the return of a pump or its value. Alterations were carried out by a firm of builders at her house, and the pump was removed and sold. Evidence was given on the part of the defendants to prove that it was customary unless there was a clause to the contrary for builders to remove

such things. Judge GYE said if the alleged custom existed it was most unjustifiable. He gave judgment for the plaintiff, and refused to grant leave for appeal. The safest way under every circumstance is to introduce a clause stating whether the materials are to remain the property of the employer or to be taken by the builder at a price to be determined. The clearing away of old materials when stated in specifications cannot be supposed to mean that in all cases they become the property of the contractor. In order that there may be no doubt on the subject, the contracts of the War Department usually stipulate that old materials are to be stacked and become the property of the Secretary of War, and that example, if followed, will often prevent disputes.

ALL who take an interest in the architecture of ancient India must be thankful for the efforts which Lord CURZON has made to insure the preservation of the monuments. It should be remembered that, as FERGUSON said, India is a complete cosmos in itself, and that nowhere else are the problems of anthropology and ethnography so easily studied. It has, however, been difficult to convince English officials of those facts. During many years they have looked upon everything ancient as barbaric or heathenish, and made no scruple of removing beautiful work in order that it might give place to modern construction. As time goes on such vandalism will be more and more reprobated. FERGUSON'S books have undoubtedly aided in converting the official mind and inducing it to value the different varieties of Indian buildings as they deserved. The Archaeological Survey of India, if less popular, has been more influential in the same direction. In spite of all that has been done, it cannot be said there exists a sufficient guarantee for the safety of Indian remains. Lord CURZON has, therefore, arranged for the introduction of an Indian Monuments Bill before the Imperial Legislative Council. The provisions are more stringent than those which are to be found in the Bills for the protection of remains in England and Ireland. There is little doubt about the measure becoming law, and then the examples of the various styles throughout the Empire will be secured against the operations of ignorant men.

THERE was a time when every visitor to Paris was expected to have a look at the artesian well of Grenelle. The metallic tower of late years has appeared to be not much of a wonder, but when it was first constructed it created a surprise which almost equalled that caused by the Eiffel Tower. Yet the cast-iron structure in the Place Breteuil is only about 140 feet in height. The water supply of Paris has always been a serious problem. The Municipal Council tried various experiments in well sinking with more or less success under the direction of M. EMMERY. It now seems incredible to learn that it was decided to sink an artesian well in the Place de la Madeleine, which is to-day one of the most important spots in all Paris. After much consideration Grenelle was selected. MULOT, the contractor, began his operations in 1834, and for nearly seven years his search for water was unrewarded. After reaching a depth of about 1,800 feet the green-sand formation was tapped, and the water burst out with a force which at first alarmed the neighbourhood. In 1858 it was decided to have a conduit from the well to the Place Breteuil and to erect a tower of bronzed cast-iron, partly for use and partly as an ornamental structure. Of late years the supply from the strata has been diminished and the authorities were forced to seek elsewhere for a new source. The artesian wells of Paris are therefore obsolete. The tower in the Place de Breteuil is to be removed in order that the great memorial of PASTEUR may be erected on the site. BRETEUIL, it may be noted, was one of the ministers of LOUIS XVI. As a politician he is supposed to have failed, but he was one of the men who sought to improve Paris. CARLYLE says of him, "Behold, a Home-Secretary BRETEUIL 'beautifying Paris' in the peaceablest manner in this hopeful spring weather of 1788; the old hovels and hutches disappearing from our bridges; as if for the State, too, there was halcyon weather and nothing to do but beautify."

THE ARTS IN GREECE.—BY E. ARMITAGE, R.A.

FRANCIS CRANMER PENROSE.

A LIFE of singular unity came to an end on Sunday, when FRANCIS CRANMER PENROSE passed from earth in his eighty-fifth year. People in general may never have heard of him, yet among architects and scholars everywhere no English name was more familiar. Never was there a man who gained a fair renown on easier terms. As an architect his works were of little account. But to be entrusted with the care of the fabric of St. Paul's Cathedral for nearly half a century will probably by many judges be considered as higher evidence of skill than the designing of several churches. There was too another circumstance which gave him importance. FRANCIS PENROSE was fortunately able to determine by the aid of instruments the exact decimal of an inch which measured the deviations between an ordinary straight line, which is the shortest distance between two points, and the lines employed by the Greeks in some parts of their buildings. Every day foremen engineers decide about a camber in girders, in order that they may not appear to deflect, without gaining the least credit for their foresight. But Greek cambering is accepted as miraculous. Mr. PENROSE came back from Athens surrounded by a kind of halo which never vanished during his life. He was revered as a seer who had penetrated into the mysteries of Greek art, and was the bond of connection between the age of PERICLES and our own prosaic days. The wonder is that he remained so unspoiled and simple. He knew nothing of the struggles which are the everyday lot of the ordinary architect. He was happy in being able to avoid all rivalry with his fellows. In a sublime region which must have resembled that inhabited by the mythical architects, he was able to live and move aloof from the cares that come with clients.

The life of FRANCIS PENROSE was one of those idyllic passings from one happy state to another which are still possible in England. Born in a peaceful vicarage at Bracebridge, in what he called the precincts of Lincoln Cathedral, a building he considered to be the finest Gothic work in England, he was early impressed by architecture. With *naïveté* he owned that after his familiarity with St. HUGH's church he was surprised to discover that he was not disappointed with the Parthenon. He spent four years at the grammar school of Bedford, and then entered Winchester College, the creation of the great architectural bishop. Next he became the pupil of EDWARD BLORE, who could claim a share in Buckingham Palace. From the drawing office he went on to Cambridge, where he became a senior optime, and, what was no doubt considered more important, was two or three times privileged to pull an oar in the inter-university race. Finally, he gained the Travelling Bachelorship. No life could be laid out on a more direct line or one more steadfastly followed.

It is not to be expected that Travelling Bachelors will always be able to extend the knowledge of architecture. Two holders of the bursary, at least, have rendered such service. EDMUND SHARPE, in his travels in France, realised the evolution of Gothic which he afterwards expounded. But as he had not the advantage of study under an architect he could only be considered as an amateur. FRANCIS PENROSE, on the other hand, had

spent some time in EDWARD BLORE's office, where there were opportunities to acquire varied knowledge. When he arrived in Greece he was therefore able to turn the mathematical and practical training he had gone through to good account.

About that period, *i.e.* between 1840 and 1850, a belief arose in the mathematical basis of beauty, and especially as exemplified in Greek architecture and sculpture. We ought perhaps to have said it was a revival of belief, for HARRINGTON had suggested to Sir ISAAC NEWTON that proportions in architecture were coincident with harmonic ratios in sound. NEWTON, in reply, said he was inclined to believe some general laws of the CREATOR prevailed with respect to the agreeable or displeasing affections of all our senses. Indeed, it was surmised from the earliest civilised ages that beauty was no fortuitous accident, but was the product of definite laws. As there was a renewal of interest on the subject, the Society of Dilettanti commissioned FRANCIS PENROSE to make a more exact measurement of the Parthenon and other buildings in Athens than was to be found in the excellent plates of STUART and REVETT.

It is often supposed he made discoveries. That is an error. His office was one of verification, but on that account was important. What he was able to accomplish that is most memorable was the establishment beyond all doubt of optical corrections, or departures from true vertical and horizontal lines. The entasis of columns was known from an early age. The word is mentioned by VITRUVIUS, although he did not approve of the principle. CHAMBERS described how it was performed without any regard for subtlety by Roman builders. A chapter on the treatment as practised in Greece was appended to STUART and REVETT's work. COCKERELL, when he went to Greece, studied the subject with care. Mr. PENROSE ascertained that the convexity of the Doric columns of the Parthenon was at most 1-550th of the whole length, forming a hyperbolic curve.

The steps of the Parthenon were so long encumbered with rubbish it was assumed the lines were horizontal. In 1837, when the masonry became less concealed, JOHN PENNETHORNE, one of the ablest of investigators of the relations between mathematics and architecture, perceived there was convexity on the planes of the steps. His discovery was confirmed by HOFER and SCHAUBERT, the German architects. Mr. PENROSE was able to prove that the front curvature rose 0.15 feet in 104 feet and the flank 0.233 feet in 221 feet. Some other instances were observed and recorded which testify to the recognition of visual defects and the providing of arrangements to nullify them, so that the temple to the keenest sight and on the clearest day would appear perfect. The real value of the investigations was not however realised by everyone in this country. In 1848 we find W. H. LEEDS, who as a writer had long upheld the superiority of Greek architecture, speaking in disdain of "the fuss made about entasis, including that about the hypothetical curvature in the horizontal lines of the Parthenon, where curvature was administered, if administered at all, in an exceedingly homœopathic ratio." That we are now able to place more value on the homœo-

pathic refinements should be considered a sure indication of our progress towards an understanding of Greek principles.

There was, then, indifference to colour as an auxiliary to architectural forms in Britain. It was taken for granted, as if it were an article of faith, that the Greek temples corresponded with the Greek statues, and were impressive from being constructed of beautiful marble, which to heighten with colour would be as much of an excess as the painting of a lily. The old English poets who treated of mythology had created a belief in the connection between whiteness and classicism. VENUS's doves were supposed to be whiter than snow; the great JOVE himself assumed the form of a white bull or a whiter swan; the silver lily was said to have sprung from the milk of JUNO. As became an University student, Mr. PENROSE accepted the tradition or the prejudice. All he could concede after testing the conclusions of the Frenchmen and the Germans was "that a peculiar yellow tinge upon some parts of the columns, especially of the west front of the Parthenon, is not simply the yellow said to result from the oxidation of iron contained in Pentelic marble, but has been applied externally as a tint, though perhaps so delicately as merely to reduce the high light of the marble without obscuring its crystalline character." That reduction he was too honest an observer to deny, for it was a necessity. As he wrote, "No one who has witnessed the painfully dazzling effect of fresh Pentelic marble under the Athenian sun will deny the artistic value of toning down the almost pure white of its polished surface, and the more so when considerable portions of the architecture were painted in the most positive colours. We need not suppose this tone to have produced more than the difference between fresh white marble and ivory." The employment of Pentelic marble, which had to be transported ten or eleven miles over a rough road, while at a third of the distance the beautiful dove-coloured marble of Hymettus was to be obtained, must have been dictated, Mr. PENROSE considered, by the appreciation of the beautiful surface, and therefore the Athenians were not likely to conceal by paint or plaster a material which had cost them so much. That there were painted or gilded ornaments he did not deny, indeed some of the patterns were shown for the first time in Mr. PENROSE's book, but the painter's work, he maintained, was confined to them. It is possible that in his conclusions he was not able to emancipate himself from the prejudice against colour which he could claim as a part of his English birthright. At the time, however, even men like HITTORFF were afraid to express all their convictions on the subject. Half a century has brought about a mighty mutation in opinion, and it is now difficult to persuade students of Greek art that white marble was ever tolerated.

"The Principles of Athenian Architecture," which was a record of his work in Athens, was considered to be the best credential Mr. PENROSE could have to obtain the office of Surveyor to St. Paul's Cathedral, as successor to Professor COCKERELL. In 1852, or a year after he received the appointment, he read a paper on the decoration of the building. In it he explained that the restoration of the cupola in "chiaroscuro" with a very large amount of gilding should be taken as the starting-point for the decoration of other parts of the building. He advocated the use of stained glass in the windows, but surface painting on the walls he considered to be out of place. In the apse, where there was much gilding, he wished to have the same sort of chiaroscuro painting as in the cupola. The small cupolas and spandrels he desired to see decorated. The spandrels, he believed, were intended by WREN for colour decorations, and they furnished positions for single figures or small groups. Monochrome painting he preferred for the spandrels of the main arches in the choir. Coloured porphyries or marbles, he said, might be fittingly introduced in the panels beneath the windows, or they could be painted in imitation of those materials, just as the pilasters in the apse were already a most effective imitation of lapis lazuli.

It was the fate of Mr. PENROSE to have to assist in the execution of divers experiments for the decoration of St. Paul's which were not in keeping with the scheme he worked out on his return from Greece. Professor COCKERELL was to some extent the advocate for a similar

scheme. He was eager to see the restoration and gilding of the dome, the completion of the gilding and painting of the choir in the style that had been commenced, and the reglazing of all the lower windows with Scripture subjects in coloured glass.

The most important events in his surveyorship were the clearing of the crypt, and the utilisation of the part which is on the site of the ancient chapel of St. Faith, the determination of the boundaries of Old St. Paul's, the alterations in the churchyard. He had also a part in the later attempts to decorate the cathedral.

Mr. PENROSE could not have charge of WREN's buildings for so many years without having his first ideas of the greatness of that architect more confirmed. His admiration for WREN was exhibited in many of the papers which he read. One was descriptive of St. Stephen's, Walbrook, of which he said that in no other building was so much made of a plain oblong space and sixteen columns. The secret he considered was to be found in the arrangement of the plan and the harmony of the proportions. The old school of mathematician-architects were believers in the adoption of certain mystical numbers, and it was characteristic of Mr. PENROSE that he should conclude that with WREN the number 7 was a favourite guide. Thus, at St. Paul's, if the principal order or 40 feet is taken as the standard, the peristyle of the dome is found to be $\frac{7}{8}$; the upper order of dome peristyle $\frac{1}{4}$, and the dome impost $\frac{7}{8}$ of the dome peristyle. At St. Stephen's he ascertained that the general proportion of the plan was as 7 : 5, the ordinary to the wider columniation 10 : 7, the height, internal, of the cupola to the basic breadth 3 : 7; the height of the column to that of the order—that is, exclusive of the pedestal—7 : 8. He could have added, with no less truth, the interesting circumstance that in St. Peter's, Rome, such ratios have been discerned as 7 : 11, 7 : 18, 7 : 15, &c.

Although he was so closely associated with Greek and Italian architecture, Mr. PENROSE was not one of those who believed that the Classic style and its direct branches were alone worth attention. His taste was more liberal. A man, he said, who could see only one style in architecture was imperfect, for there was a central element in art which was quite independent of any style. The love of the Parthenon, he declared, by no means excluded the love of Lincoln and Salisbury, although one might hold the Chapel of Henry VII. as fantastic. The true work of the architect was with the business of the day, and while he should study ancient principles he ought rarely copy ancient details. In the study of the art one should go to the fountain-head, and the finest works alone should be considered. To that catholicity of taste he was faithful throughout his life.

What he said about the true work of the architect being with the business of the day must have been spoken with some regret. His mathematical investigations of Greek temples were not a recommendation in the eyes of the men of business who have commissions to give. We published several years ago a view of a chapel in Marylebone, the only one, we believe, which he designed. When the Gold Medal of the Institute was awarded to him, the most important actual work in stone by Mr. PENROSE which could be referred to consisted of the steps at St. Paul's, the curved lines of which were derived from his studies at the Parthenon. His care of St. Paul's would, by itself, be enough to insure respect for his memory. His time was, however, fully occupied, for, besides the cathedral, the starry heavens awaited his applications of mathematics. The late Sir WILLIAM ROWAN HAMILTON, who was the greatest mathematician of the nineteenth century, although he was an Astronomer-Royal, did not look through his telescopes more than once or twice a year. Observations he left to his deputy. He used to explain his indifference by declaring, "The stars move all right; but what interests me is the high *mathesis* that accounts for their movements." That was the spirit in which Mr. PENROSE worked. Among his astronomical productions is "A Method of Predicting Occultations of Stars and Solar Eclipses by Graphical Construction." In other words, stars and suns were shown to be as amenable to graphics as a theoretical girder or roof. In the same way he demonstrated a relationship between certain astronomical facts and the

disposition of Greek temples. Architecture and astronomy were to him identical in some of their aspects.

The Royal Gold Medal of the Institute was awarded to him in 1883. The reasons assigned for the choice were—first, he was a past vice-president; secondly, he was Surveyor to the fabric of St. Paul's; thirdly, he was the author of a work on the principles of Athenian architecture. Two years afterwards he was elected an honorary fellow of Magdalene College, and in 1886 he was able to return to Athens as director of the British Archæological School. He succeeded Sir A. W. FRANKS as antiquary to the Royal Academy.

It would be vain to propose his life for imitation, for so happy a combination of favourable conditions is rarely likely to arise with ordinary mortals. A second FRANCIS PENROSE may never be seen. But such work as he was destined to do he carried out faithfully, and it may be there was an exact correspondence between his capacity and his career.

THE PRINCIPLES OF ARCHITECTURAL DESIGN.

By PERCY L. MARKS.

CHAPTER VI.

ORNAMENTS AND SURFACE DECORATION.

UNDER the heading of Projections various features were noted which will receive further consideration in the present chapter, bearing as they do a decorative as well as a constructional value (perhaps the expression "practical value" would be more fully in accord with the facts).

The varieties of projections were noted as innumerable; similarly with ornament and wall-surface decoration generally, but the underlying principles governing their application can be stated within very brief compass:—

1. Applied ornament is to be secondary to and dependent on the surface of application.
2. Excess of ornament is an evil to be avoided.
3. Of two alternative modes of treatment open to criticism, a scant provision of surface decoration is preferable to a superabundance of ornament.
4. Ornament must be adapted to climatic and atmospheric conditions.
5. Ornament must be adapted to its distance from the spectators.

In reference to the last, two notable examples may suffice as illustrations, namely, the fine series of alti-relievi round the base of the Albert Memorial, London,* and the equally important frieze to the Institute of Chartered Accountants, in the same county; both Sir GILBERT SCOTT (in the former) and Mr. JOHN BELCHER (in the latter) have well adapted their ornament to the spectator's point of view; in fact, the principle has been carried to excess in the case of the Institute, as the following point will make clear. The figure of the architect (to the extreme south-east of the frieze) has the nose absolutely flattened, as it was apparently considered that this would be the optical effect when viewed from beneath, and though such treatment would be justifiable in pictorial design, it is inadmissible in the plastic art. Could it be supposed that the architect in his living guise were to take the position given to his effigy he would be loath to have his nose flattened, and would maintain that such an operation was needless, as the optical illusion would be produced without it, whether desirable or otherwise. If the object be to correct the optical illusion, it fails. But with the frieze as a whole, architects are likely to be in accord in acclaiming its merits.

Not infrequently, however, ornament is placed in positions so remote from any intended point of view as to preclude it from being intelligible. In these cases the use is inappropriate, and the ornament should have been omitted. As a general principle bas-relief (low relief) should be so placed as to be within short range of the eye of the spectator, mezzo-relievo (middle or medium relief) and alto-relievo (high relief) being proportionately at greater distances. Further, the general principle holds good, that

to gain the most effect, the ratio of depth of relief should vary directly as the strength of light.

Again, ornaments such as the *fret*, *lozenge*, the plain varieties of *guilloche*, the *egg and dart*, &c., bear application at a greater distance from the eye than is advisable for any of greater delicacy or intricacy, as, for example, the *diaper*, *honeysuckle* or the developed *scroll*. The artistic sense inherent in most educated people resents the waste of effect by the display of ornament in positions where its intelligibility is only to be discerned by the protracted use of field glasses. The higher levels of a building are best kept comparatively plain—comparatively, not necessarily absolutely.

Lettering may, of course, be placed in any position, and can be suitably diminished or increased in size according to whether it is nearer or more remote respectively.

Broadly stated, the more solid and sturdy portions—i.e. constructively—of any building should be nearer the eye, and those portions that are further away should be lighter in construction; but as regards surface decoration of the nature of applied ornament the reverse process should be employed. This results in the maintenance of a proper balance in vertical design.

It is, however, to be remembered that, whilst for the most part, the application of ornament should be governed by the point of view of the general spectator, circumstances may justify special applications for specialised views, as, for example, from balconies.

It is a debateable matter as to the length to which it is justifiable to use "heroic" figures for relief and statuary. In the first place, the figures, symbolic or illustrative of mythological and other such characters, may be of heroic size without any adverse criticism being justified. Again, it will scarcely be contended that if figures of human beings, &c., are desired at a considerable height they should only be on the actual human scale, for this would render their introduction in such positions abortive; but what admits of discussion is the point whether figures whose prototypes possess a definite, a limited scale, should be placed in positions where either truth must be abandoned or else rendered ridiculous. As it is not desired to set up in this series an impossible standard, the writer prefers to refrain from dogmatic utterances on such a point, and will merely emphasise the fact that such ornamentation is in opposition to the double-barrelled maxim of the London Architectural Association—"Design in beauty, Build in truth," this being the whole duty of an architect.

But to continue with regard to statuary. Whatever may be the individual decision as to figures at a considerable height, it should at least be clearly recognised that only typical dimensions should be given to statues and figures placed within easy range of the spectator's eye. It is possible that this "principle" would have been taken for granted without comment in these articles were it not that so many examples of statuesque sons of ANAK are to be noted. The use of this last expression naturally induces a further current of thought, and suggests the following comment in regard to the Royal Exchange, London. The grasshopper finial, though suggestive, is unpleasing—suggestive, as it establishes the close connection of Sir THOMAS GRESHAM with the fortunes of the building; unpleasing, as it tends to give such a false idea of the scale of this insect. On St. Paul's Cathedral the ball-and-cross finial is thoroughly satisfactory, partly due to the fact that a typical limit to size for these features does not obtain; similarly in the cases of the dragon finial to the steeple of St. Mary-le-Bow Church, and the key finial to the church of St. Peter-upon-Cornhill, both in London. Instances might be multiplied on either side, but with small profit.

It can be well understood how the continued use of a microscope tends to create a feeling of disgust with articles of daily consumption, when specimens of these are submitted to the searching lens. The feeling is an entirely unreasonable one, but the want of reason has only the slightest effect (if any) on those who have beheld cheese-mites and other micro-organisms enlarged to a scale of, say, one foot to represent an inch. This comment is not out of place here, as the inference intended to be drawn is this, that whilst abnormal enlargement is required in order to study the structure of the objects, the enlarged-scale diagrams, so dear to the heart of the Natural History Soirée

* For series representing Art, see *The Architect* for January 2, 1903.

provider, are nothing but snares and delusions to a gaping crowd. And these abnormalisms have nothing but the shadow of justification when transferred to architecture.

Whilst Brobdingnagian proportions are thus deprecated, Liliputian treatment allows more to be said in its favour, and for this reason, that Nature through her laws of linear and aerial perspective produces, or is apt to produce, at all times and in all places, the appearance of diminished size, whilst the optical illusion that increases the apparent size of an object is one of rare occurrence and requiring special conditions. The illusion that people may experience when seeing "double" (as it is termed) results from the operation of a natural law which is entirely under the control of individual members of the human family, and need not be dealt with here, nor need the action of fog and mist be enlarged upon. But this diminution in size of figures does not admit of universal application. If a statue, or a group of statuary, is to be produced, it must be remembered that whilst heroic size *may* be condoned, diminished treatment should be tabooed. This, too, is the case with alto-relievo, though it is not easy to explain why this should be so. It is of importance to remember, in dealing with figures in relief, that as long as the figure is attached in *appearance* (however slightly) to the background, diminished scale is permissible, but as soon as there is the *slightest* appearance of isolation, then the full scale must be employed: in short, bas relief and mezzo-relievo admit of diminished scale; alto-relievo forbids it.

(To be continued.)

EYE-STRAIN.*

AN architect is of more importance than any of his works, and at least an equal general interest should be shown in his conservation. It would on that account be an advantage if the Architectural Association or some of the local societies who have able physicians in the neighbourhood were occasionally to obtain a paper on some of the dangers to which architects are particularly liable. Take one variety. There is no doubt that architects do not observe sufficient care of their eyes, especially in the early days of practice. In preparing drawings the strain on the eyes becomes more oppressive by anxieties which are not shared by other artists. It is not enough for an architect to produce pleasing forms on paper. He must also remember that every line represents the expenditure of money by a client, and inaccuracies always cause inconvenience, if not loss. It is remarkable as an indication of the weakness of the eyes which follows too close an application to the drawing-board, that as far back as 1815 STEDMAN WHITEWELL, an architect, invented spectacles with square-shaped lenses, each side being ground as a cylinder with the axis of one at right angles with that of the other, in order to correct that astigmatism which of late years is believed to lead to brain disease and other forms of illness.

If, as Dr. GOULD maintains, eye-strain has been the origin of many of the troubles of such men as DE QUINCEY, CARLYLE, DARWIN, HUXLEY, BROWNING—and they are supposed to be no more than representatives of afflicted humanity—there is no reason why those who employ their eyes amidst constant solicitude should be exempt from effects which are not confined to bodily pains. It is, of course, rather novel to find that mental sufferings may arise from too concentrated an attention on thinking or composition. It will be incredible to many to hear that the poet's eye when in a fine frenzy rolling may be only a forerunner of physical and mental agony which masters of language find it difficult to describe in words. DE QUINCEY, CARLYLE and the rest have attributed their sorrows to different origin than literary creation. The five men whose cases are considered by Dr. GOULD had, moreover, their time medical aid, and their symptoms were diagnosed by physicians who were reputed to be able. We know to our cost how easy it is for professors of medicine to be at variance in their opinions

and how their unlucky patients must accept the consequences. Where is the man who has not suffered through a doctor's blundering? The clinical subjects mentioned in the book had, no doubt, more or less misgiving concerning the infallibility of the men who treated them. Dr. GOULD is of opinion that the patients were not far wrong. He says in one place:—"CARLYLE's opinion of the medical profession was, so far as concerned his own case, entirely justified and justifiable. Had he consulted a hundred of the best general physicians in England he would have got no more help than from the one he sought out in Edinburgh. It was exactly so later with DARWIN, HUXLEY and BROWNING. 'The stomach' and 'the liver' would have been charged with bad function, and travel and rest would have been ordered. Indeed, it would be precisely the same story to-day."

The statements which Dr. GOULD has taken from CARLYLE's writings are formidable as indictments of the ignorance of physicians. BULWER LYTTON defined the practice of medicine as the putting of substances about which we know little into a body of which we know less, and the apparently cureless condition of THOMAS CARLYLE, after repeated dosing, was expressed by himself as if he were a second PROMETHEUS chained down in a small house in a back street in Chelsea rather than on the Caucasus, and with an always voracious vulture on top of him. But in one of the letters which he wrote in his old age he gives an abstract of his sufferings which is more telling than any of those in Dr. GOULD's excerpts. "As to myself," he bemoans, "I know sadly, at all moments, dyspepsia to be the frightfullest fiend that is in the pit, or out of it; the accursed brutal nightmare that has ridden me continually these fifty odd years, preaching its truth gospel (would I had listened to it, which I would not); but, alas! as to any 'cure' for it, the patient is too old; the patient has it in the blood, in the nerves and brain of him as well; and has no cure of the least likelihood, except the indubitable cure which is now near ahead." When CARLYLE wrote in that style the great contests of his life were over, and it might be supposed that, having no longer any incubus upon him, such as the life of FREDERICK THE GREAT, he would have attained some cessation of pain. He was attended, too, by Sir R. QUAIN, and that eminent physician came to the conclusion that the true cause of CARLYLE's life-long woe was his weakness for ginger-bread! Medical science is a strange thing, when the busiest practitioner in London can arrive at no other result. The doctors failed in CARLYLE's case, as in those of HUXLEY, DARWIN, DE QUINCEY, BROWNING, and myriads of unknown men and women. It is, therefore, allowable for Dr. GOULD, or any other man, to endeavour to demonstrate how erroneous was the treatment. He shows from the patients' writings how constantly attacks were preceded by headaches, and he maintains that "the vast majority of such cases, say, at least 90 per cent., are not caused by dietary indiscretion or organic disease, and of these over 90 per cent. are reflex ocular neuroses, *i.e.* due to 'eye-strain'—a term denoting morbid function, not over-use of normal function."

Americans have become so excessively ingenious in the production of oblique puffs of their wares, we must say that we imagined Dr. GOULD's book, which has excited an unusual amount of attention for a medical treatise in the course of a few weeks, was intended to be no more than an argument for a new form of spectacles, an improvement on those of WHITEWELL the architect. But he has not invented any appliance to set literary men right, or those men who are compelled to run the risk of headaches and other miseries by straining their eyes through too much labour. As he sometimes orders patients abroad, and while in Europe recommends them to have their eyes corrected, it cannot be said that he is advising patients to visit him in Philadelphia. In that city it appears ophthalmology receives especial attention, and possibly in course of time a great medical school may arise there. The subject is one which has not been sufficiently studied, and there is a need for investigation in many fields. Some years ago artists and amateurs were startled when Mr. LIEBRICH explained the causes of TURNER's peculiarities in his later pictures, as also why MULREADY was subject to the weakness of imparting a purple colour to the

* *Biographic Clinics: The Origin of the Ill-Health of De Quincey, Carlyle, Darwin, Huxley and Browning.* By George M. Gould, M.D. London: Rebman, Ltd.)

flesh of his figures. The defects were due to some of the changes in the eye which old age brings, and it was found that the pictures by the two artists could assume a normal appearance when looked at through glasses of a special kind. The same inquirer also caused a revolution in schools and school fittings as a result of his practice as an oculist. Many other shortcomings of artists may be traced to a similar origin. Nor can it be concealed that inconvenience is sometimes caused through the inattention of architects to the sensitiveness of ordinary eyes. Dr. GOULD says that one optical law is violated constantly by the way in which buildings are lighted. Another torment must be ascribed to painters, or rather the directors of exhibitions. It is, for instance, a stereotyped law of the Academy that "All pictures and drawings must be in gilt frames," although in every continental exhibition each painter is allowed to employ the kind of frame best adapted to enhance the effect of his work. What Dr. GOULD says on the subject is so rational we append the passage, and it will suggest that the purpose of the book is an endeavour to promote the health, not only of some of the most useful members of Society, but general sanitation as well :—

By the old-fashioned gilt barbarisms the artist allowed the framer and gilder almost to monopolise the mental, emotional and physiological attention of the spectator and to detract as much as possible from interest in the picture itself. It is only for a few seconds that any human eye can look at a picture when the greater portion of the retina is outraged and exhausted by the adjacent images of the atrocious frame. In the ordinary gallery of pictures these ludicrous and retina-paralysing frames, close beside each other, become positively torturing. It all seems designed to exhibit, not art, not nature, not æsthetic charm and emotional peace, but only the abject hideousness of the plebeian frame-gilder's unart. Almost every traveller has noticed the utter exhaustion and headache that is produced by a short visit to a large picture-gallery. The crude harsh gilt is the most wearying of all colours. Recently there has arisen a reaction of which probably no one understands the reason, consisting in the making of frames with solemn and monotonous black. This extreme is infinitely preferable to the other, but it is also mechanical and stupid. Each picture should be framed by the painter—or at least, and because he has shown himself so blunderful about it, by another artist—with this single task in view. Each picture presents a special problem to the artistic framer. It should be done so as to produce a peculiar logical and physiologic colour-effect, as little wearying to the eye as possible, while dictated primarily by the character, the colours used, the æsthetic aims, &c., of the painter. It should by all means be hung sufficiently apart from all other pictures to allow it the proper necessities of its own individuality and not to destroy that of others hung in the neighbourhood. Pictures crowded together give evidence of the æsthetic sin quite as decidedly as the physical crowding of human beings demonstrates other sorts of immorality. In a word, the present fashion of framing and hanging pictures could not be more unæsthetic and unphysiologic, more unphysiologic and pathologic than it is. Another corollary of the law of ocular tire and resensitisation may be noticed in passing—a law that is outraged by the lighting of most of our churches, and of all our private houses, theatres, public halls, &c. The millions of dollars spent each year in illumination are in great part wasted and misspent, and by the methods used all the harm is done to the eye that is possible. No room should be lighted in such a manner that the individual lights are visible. Illumination should be by transmitted, dissipated and reflected light. There is nothing more tiring to the eye than numerous separate lights whose images upon various parts of the retina create there a large number of useless and exhausting stimuli, and from which there is no escape by any device or turning.

It may be said in conclusion that no medical book of our time is so well adapted to attract the attention of artists and men of letters. As a rule they are, no doubt, poor patients, and English physicians, at least, have therefore bestowed only very little attention upon the pains and penalties which can be considered as belonging to their callings.

Sir Frederick Treves will on Monday open the new operating theatre at the Dorset County hospital at Dorchester, his native town. The new wing has been erected by public subscriptions, and an operating table of the latest pattern has been given by Sir Frederick Treves.

THE ROYAL SCOTTISH ACADEMY.

THE exhibition of the Royal Scottish Academy will this year, says the *Scotsman*, be found of exceptional interest. By the resignation of one president and the election of another the Academy has entered on what may, without figure of speech, be regarded as a new stage in its career of artistic usefulness, in which it may be wished all success; and it was no more than what was looked for that the incident alluded to would in some degree at least make its influence felt in the conduct of the annual exhibition. This has happened. Since Mr. Guthrie was appointed president new life has been infused into all departments of the Academy's works, and here and there changes of a somewhat drastic character have been introduced, and for the most part with good effect. For example, the number of pictures that can be shown by one exhibitor has been cut down to three instead of five as formerly. One result of this has been that more space on the line has been available for outside pictures of merit. The water-colour men have got the north room to themselves, and an old feud may now be regarded as settled; the architectural drawings have been hung in the small octagon from which the obscuring glass has been removed; the sculpture has been set out in the various galleries in an agreeable manner, and the rooms generally have been decorated with much taste. The walls are covered with a neutral green-grey "scrim," above is a frieze and "swag" in another quiet colour, while the central great-room has its wide arched openings partially closed by portières of deep-toned Gobelin blue cloth, with an effect which is felt along the whole line of the galleries. A great change is also evident in the number of pictures accepted and the manner in which they have been hung. There was a strong feeling in the Council that the standard of attainment should be raised so that the acceptance of a picture or other work of art from one outside the Academy should be a certain hall-mark of its merits. In carrying this purpose into effect it is possible to come across genuine cases of individual hardship, but on the whole the public generally are likely to recognise that, stern as the process has been, the exhibition is the gainer. In all only 526 works of art have been placed, as compared with 789 last year, 812 in 1901 and 782 in 1900. This year 1,305 works of art of all kinds were sent in, including 697 pictures in oil and 407 in water-colour, and it will show how tightly the net has been drawn when it is mentioned that only something like 275 pictures in oil have been hung and 137 in water-colour. For one thing there are on view more large pictures than usual, so that the galleries do not appear at all empty, though for the most part the hanging has not been carried higher than the portrait line, except in the case of a few full-length portraits. The value, in the general effect of the hanging, of having restful spaces both above and below the pictures, has been freely recognised—spaces which the rejected ones will think would have been much better adorned by their pictures. There are a few loan works of great worth by eminent home and continental masters upon the walls. The Council have been fortunate in securing examples of the art of Whistler, James Maris, Matthew Maris, Orchardson, Josef Israels, J. S. Sargent and E. J. Gregory, which undoubtedly are features of strength in the exhibition. But for its real success the exhibition, it is gratifying to say, is mainly indebted to native talent—to the members and associates of the Academy themselves, who have rallied right loyally to make the first exhibition of the first year of the new President worthy of the occasion. Only one painting member and one painting associate do not exhibit in this exhibition, which in all respects is a credit to Scottish art, which is one of the best seen of late at the Mound, and which gives evidence that there is an immense amount of painting talent in the Academy, and by others still outside its pale. The Academy having done so much, it remains for the public to show their continued interest in the national Academy of art, in one of the practical ways they have in their power to do so, by attending in increasingly large numbers the annual exhibition.

The *Glasgow Herald* says:—Although the Academy is now in the last quarter of its hundred years, the show at this time may be said to indicate definite advance over several of its predecessors in respect both of quality and general arrangement. In the past artists connected with the Academy might each claim to be represented by as many as five pictures. This year three only are allowed to find wall space. The effect of this judicious limitation is that 526 works are exhibited, as compared with 789 in 1902 and 812 in 1901. Large canvases are more numerous than before, but it must be said that in every case, so far as a necessarily hurried inspection enabled one to judge, the artist is justified in treating his subject on a more generous scale. Another result of the restriction of exhibits is that the sky-line has been practically effaced. Loan pictures are hardly as numerous as we have seen in previous years, but, on the other hand, those which have been parted with by their owners for a time are of exceptional importance. This may also be said

of portraiture, of which there are many distinctive examples. Water-colour drawings, which in the past have been treated with scant consideration, are now suitably hung in the north gallery, first entered by the visitor. The art of the sculptor is well represented. It has been distributed throughout the galleries, lending grace and distinction to the show. It may be noted also that the walls have been draped in old gold and faint green, and that the small octagon, to which architectural drawings are consigned, is much better lighted by the removal of the semi-opaque glass overhead, and the substitution of undimmed transparency—an improvement obvious to all save those in authority outside the Academy for which we have once or twice vainly petitioned in these columns. Edinburgh artists are not largely represented in the Royal Glasgow Institute. They would seem to have reserved their energies in order to signalise the first Academy Exhibition under the new President. They have done so to good purpose, and we do not in the least dispute their wisdom or question their loyalty. Glasgow artists, or at least those still resident in the metropolis of the West, are not in triumphant evidence, although a landscape bearing the name of one member of the brotherhood, to which we shall afterwards refer, is one of the most convincing works of its kind in the exhibition. As a rule, the artists of Glasgow are represented each by a single picture. On the whole, it is evident that a progressive spirit has been in operation this year. The election of Mr. James Guthrie as president of the Academy in succession to Sir George Reid, whom we all admire as an artist and esteem as a man, has doubtless led to the adoption in some measure at least of Glasgow methods, into which may be said to enter such attributes as decision, energy and enterprise, as distinguished from adherence to academic tradition. The collection has been admirably hung by Messrs. J. Lawton Wingate, Robert Alexander, Thomas Scott, W. G. Stevenson and G. Washington Browne. To such a task as theirs, always delicate and difficult, is added the complexity arising from the octagonal form of the rooms.

WEST WINDOW, EXETER CATHEDRAL.

THE Chancellor of Exeter Cathedral has written to the *Times* on the subject of the letter we reprinted last week. He says:—

There is nothing surprising in the fact that Mr. Stuart A. Moore should in your columns chastise the Dean and Chapter of this or any other cathedral for any offence against the precepts of antiquarians.

But it is surprising to find him giving himself away, and, so far as his letter is trusted, misleading your readers by making statements that, if they were accurate, would not serve his case and, not being so, are of no use to anybody. We have a kindly recollection of him here in Exeter. He did excellent work here in the arrangement of our documents. His calendar here is our constant comfort and not a bad memorial of him. I hope his expression of opinion will not be considered part of the "chronic mania" with which he charges us. His letter is not serious enough for official notice. "Chronic maniacs" are excused from answering provoking charges.

We have no business, he thinks, to take Peckitt's glass out of Grandisson's window, and he rests his case for retaining it upon its history and its character.

I will deal first with the historical part of his letter, and then with the artistic part, in which he defends Peckitt's window as a work of art in harmony with the cathedral. He says:—

"The glazing of the cathedral can be traced on the fabric rolls. The bills show that the proportion of coloured to white glass was one-fourth of colour. . . . Peckitt must have observed this and done his best endeavour to treat the west window in the same spirit."

Peckitt was a clever man if he did observe this, for the fabric rolls referred to are those from 1308 to 1319. Peckitt came to Exeter "to observe" in 1765, four centuries and a half later. It is almost demonstrable that the glass in the windows referred to in the fabric rolls had vanished from the windows two centuries before Peckitt's visit. So much for one statement; now for another.

Mr. Moore claims that he, by pointing out to Sir Gilbert Cotton "in the records" the date of the great east window, saved it from being removed by the Chapter of that day, glass and all. This surprising statement will suffer in stability if reference be made to such an accessible book as Oliver's history of the cathedral. It was published in 1861. It is in everybody's hands here. On pages 206 and 207 there will be found the date of the window, 1391; the name of the donor, Henry Blackborne, a canon of this cathedral, and the price per foot of the glass. This was twelve years before Mr. Moore touched the fabric rolls of the cathedral. This history of the window and its date were therefore matters of common knowledge.

Allow me to point out to your readers that even this is not the east window of the fabric rolls, for that was erected in 1301-2. We do not know here why, only ninety years after its erection, it was taken out of its place. But we think that "chronic mania" for destruction is the least likely hypothesis that "the delusive faculty" can tempt even an irritated antiquarian with. We are entitled to feel sure, however, that Peckitt did not "observe it" in 1765.

To pass over other statements which with equal care a "plain tale" would "put down," your readers may like to have some account of the window which is to be removed.

The glass in it was placed there in 1767. The idea of the window is that over and around the seven figures which Peckitt painted on coloured glass a border should run consisting of the coats-of-arms of the subscribers, the border running up into the great wheel, where on a foundation of ducal and baronial shields the less impressive coats of baronets should float in the "diluted rays" of the setting sun. Various armigers also had their arms below. The balance-sheet is as I write before me; it will be seen that the idea caught on. I quote one or two items:—

"Received from the Archbishop of Canterbury, the Dukes of Somerset, Beaufort, Bolton, Bedford, the Earls Godolphin, Granville, Orford, Viscounts Falmouth and Courtenay, the Lords Petre, Clifford, Edgcumbe and Fortescue, at six guineas guineas each, 88*l.* 4*s.*; fourteen baronets, at five guineas each, 73*l.* 10*s.*; four members of Parliament, at five guineas each, 21*l.*"

The Dean and Chapter were good financiers. They made a profit on the archbishop's arms of two guineas, a guinea each on the arms of each peer, and on the arms of eight of the baronets and the four members of Parliament of a guinea and a half each. But the business side of Mr. Peckitt's head was better than the artistic side. He brought in a bill for extras which more than swallowed up the savings.

It wants very little reflection to arrive at a reasonable conclusion as to whether the glass of a design so inspired is likely to be worthy of a place in the finest window that the fourteenth century has bequeathed to us here in Exeter Cathedral. The window is Grandisson's *chef d'œuvre*; the glass approves itself to Mr. Stuart Moore.

SEALS OF SCOTTISH ABBEYS.

AT the last meeting of the Society of Antiquaries of Scotland, Mr. A. H. Millar read some notes on the ancient burgh seal of Crail and the seal of the Chapter of the abbey of Coupar in Angus. The antique instrument used for impressing the burgh seal of Crail was accidentally discovered in August last in the course of the demolition of a ruinous tenement there. It had been laid on the top of the wall under the sloping roof evidently with the intention of concealing it. The copper dies or matrices of the seal are fixed in a machine like a modern copying press and operated by a screw. The device of the seal is of great interest. The obverse shows the Virgin and Child, the Virgin seated on a throne, and an angel swinging a censur on either side. The reverse shows a large galley with a dragon's head on the prow, one mast and large yard with the sail close furled, and on the masthead a pennon with a St. Andrew's cross. The heads of a crew of six appear over the netting along the gunwale, and in the sky are the moon and stars. Dundee had a seal with the Virgin and Child on the obverse, which was discontinued after the Reformation, and Crail, which was the site of a collegiate church of St. Mary, seems to have abandoned the ecclesiastical part of the seal, and continued the use of the reverse only. The oldest impression known is that preserved in the chapter-house at Westminster, which was appended in 1357 to the engagement by the Scottish Burghs for the ransom of David II., and the seal now discovered corresponds in every detail with this impression. In October of last year Mr. Richard Morrison, a dealer in antiquities in Dundee, brought to the author of the paper a brass seal, which he was able to identify as the capitular seal of the abbey of Coupar in Angus. The matrix bears a very rich design, showing a figure of the Virgin seated under a Gothic canopy, holding in her right hand a branch of lilies and supporting the infant with her left. In the lower part of the field, within a niche, is an abbot, kneeling and holding a crosier. At the sides of the niche are two shields, the dexter bearing the arms of Scotland and the sinister three escutcheons, being the bearings of Hay. The block of the seal has a handle at the back in the likeness of the Virgin, crowned, and holding the infant in her arms. The height of the figure is 4½ inches. The seal is now in the possession of Lady Abercromby, Camperdown House, Dundee. The abbey of Coupar in Angus was founded in 1164 by Malcolm IV., and the Hays of Errol were among the principal benefactors, their grants to it beginning in 1170 and continuing till the sixteenth century.

NOTES AND COMMENTS.

THE right to a sitting in an English parish church, although it is sometimes claimed, is rarely considered to be so personal a matter as to need litigation. Consequently alterations and rearrangements of English churches rarely excite much opposition among a congregation. In Scotland the subject is regarded otherwise, for it is believed that the sittings in a church can never be diminished. That spirit is often an obstacle to improvements. A case of the kind is now being debated. A sum of about 800*l.* was bequeathed for the reseating of Dunfermline Abbey, a building which is of great historic interest. For many generations it was the burial-place of the kings of Scotland, and in 1818 the remains of ROBERT BRUCE were disinterred from it. The reseating would not be proposed if the present arrangement was perfect. Knowing the difficulty, Sir ROWAND ANDERSON was consulted, and he prepared a scheme which is adapted to the area, but if carried out one in ten of the present sittings, or say a total of 170, would have to be sacrificed. It is apprehended, however, that the old arrangement will have to be adopted. In any case it will be necessary to alter the flooring, and it is proposed to have a bed of broken stone covered with asphalt under the new flooring. A better system of heating will be necessary, as well as means for adequate ventilation. Altogether, 3,000*l.* at least will have to be expended in addition to the legacy. It would be a serious matter if, through one or more individuals, the proposed arrangements cannot be accomplished. So important a building ought to exert an influence on the minds of those who visit it weekly, and induce them to think less of themselves and more of the church as an institution.

THE arrangements are nearly completed in Paris for holding a building exhibition in the Grand Palais. It is to be international. The Germans have expressed a strong desire to take part in it, no doubt with a view to obtaining orders for some of their productions. The section relating to model dwellings has an interest for the Belgians, and they will contribute not only to it, but to some others also. There is no country in Europe where so much attention has been bestowed on the subject as in England, and it is believed that models of a great many English blocks of habitations, let at a cheap rent, will be shown. The project indicates the great change which has taken place with respect to exhibitions in France. The original exhibitions which Frenchmen originated displayed all varieties of industry, or as many as could be arranged for. But within the last few years the preference is given to special exhibitions. They cost less money than those which are general. They bring forward inventions which might otherwise be overlooked, and above all they afford opportunities for gaining medals and diplomas, and it may be even higher honours, by citizens of humble classes.

THE practice of golf in England has revived interest in the ancient city of St. Andrews, the seat of the earliest of the Scottish universities. The city has had its vicissitudes, and strange to say it suffered through the Reformation unlike most other parts of Scotland. When Dr. JOHNSON visited St. Andrews in 1773 he mentioned "the silence and solitude of inactive indigence and gloomy depopulation" which characterised the streets. Since those days the old city has improved, but it is doubtful whether it will be possible to raise the 23,500*l.* required for the restoration of the town church unless it is obtained from Scotsmen elsewhere. The people of St. Andrews have promised 9,400*l.* towards this sum, which is a liberal amount. According to an appeal which has been issued sketch plans of the proposed restoration have been prepared by Mr. P. MACGREGOR CHAMBERS, an architect of wide experience in ecclesiastical work, which have been approved by those who have inspected them. The main idea is to preserve the fine old tower and all that remains of the Mediaeval church, and to rebuild the remainder upon the original plan as far as it can be ascertained. The galleries will be removed, the side aisles will be reduced to their original height and the old clerestory will be reproduced on pillars and arches occupying their ancient places. The walls will be of stone throughout, and the greater part of the seats will be of oak.
